LONG TIME SERIES MEASUREMENTS IN THE COASTAL OCEAN: A WORKSHOP
C. L. Vincent (Coastal Engineering Research Center, Vicksburg, MS.), T. C. Royer (Alaska Univ., Fairbanks, AK.), and K. H. Brink Nov. 1993 104 p Workshop held in Washington, DC, 11-12 Mar. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant NSF OCE-92-24824)
(AD-A279509; WHOI-93-49) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Existing long time series efforts can be readily augmented by addition of existing sensors, enhancing scope and impact. Significant benefits would result from multidisciplinary measurements to document long-term trends in physical as well as other variables. Standard observations as well as a diversity of approaches and measurements should comprise the suite of long-term measurements. Sites for long-term observations should be selected to define processes, represent major and diverse oceanographic systems, and to document pristine as well as stressed systems. The initial rationale for sites and observed properties must be clearly defined to avoid monitoring for monitoring's sake. In the long term, three-dimensional zones ('corridors') of long time series measurements might be created. Long time series measurements should be supplemented with process and modeling studies to ensure appropriate rationale and to provide a regional understanding for the site-specific observations. The Coastal Ocean Processes Program (CoOP) might provide some of these studies. DTIC

LONG TERM CHANGES ON THE CONTINENTAL SHELF OF THE NORTH SEA: INVERTEBRATE TRENDS, 1931-1990 [LANGE TERMIJN VERANDERINGEN OP HET NEDERLANDS CONTINENTAAL PLAT VAN DE NOORDZEE: TRENDS IN EVERTEBRATEN VAN, 1931-1990]
C. G. N. deVooys, J. I. J. Witte, R. Dapper, J. vanderMeer, and H. W. vanderVeer 1993 74 p In DUTCH Prepared in cooperation with Rijkswaterstaat, Rijswijk (Netherlands). North Sea Directorate
(PB95-135224; NIOZ-1993-17) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

Alterations in the functioning in the ecosystem of the North Sea can be made visible from long series of observations. At the Netherlands Institute for Sea Research a registration for (epi)benthic invertebrates from 1930 till 1992 exists caught between 52 and 55 degrees North and 3 and 7 degrees East. In this report, data of 15 species of invertebrates were analyzed: the whelk (Buccinum undatum), red whelk (Neptunea antiqua), slender spindle shell (Colus gracillis), common cuttlefish (Sepia officinalis), common European squid (Loligo vulgaris), lesser octopus (Eledone cirrosa), European lobster (Homarus gammarus), Norway lobster (Nephrops norvegicus), edible crab (Cancer pagurus), velvet swimming crab (Macropipes puber), masked crab (Corystes cassivelaunus), green sea urchin (Psammechinus miliaris), purple heart urchin (Spatangus purpureus), dahlia anemone (Tealia felina) and the sea mouse (Aphrodite aculeata). From these data maps for each species were prepared for periods of 10 years between 1930 and 1990, and the pattern in occurrence over the period 1930-1990. Besides, an ecological description is given for each species. First the results are interpreted in connection with the life cycle of the species. Next the patterns are compared with those found earlier for a number of non-commercial fish species. The largest alterations in the North Sea since 1930 relevant to the occurrence of invertebrate species are changes in fishery, pollution and climate. NTIS

A NUMERICAL STUDY OF WIND FORCING EFFECTS ON THE CALIFORNIA CURRENT SYSTEM M.S. Thesis
James R. Vann Sep. 1994 230 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A286205; NPS-OC-94-006) Avail: CASI HC A11

A high-resolution multilevel, primitive equation ocean model is used to examine the response of an idealized, flat-bottom, eastern boundary oceanic regime on a beta-plane to climatological average (1980-1989), individual year, and multiple year wind forcing. The focus of this study is the California Current System along the coastal region, from 35 deg N to 47.5 deg N, off the West Coast of North America. Two types of experiments are conducted. The first type forces the model from rest with climatological, 1981, and 1983 monthly winds to examine the generation phase of features such as currents, upwelling, meanders, eddies, and filaments. The second type continues the forcing from the previous years to examine the maintenance of these features. In the first type of experiments, the following features are observed: a poleward coastal surface current near the start and end of each year, and equatorward surface current, a poleward undercurrent, upwelling, meanders, and eddies. In the second type of experiments, meanders and eddies were already present at the start of the experiment. In addition to the features observed during the first type of experiment, filaments are generated. The results support the hypothesis that wind forcing is an important mechanism for the generation of many of the observed features in the California Current System. DTIC

THE ISOTOPE GEOCHEMISTRY OF ABYSSAL PERIDOTITES AND RELATED ROCKS Ph.D. Thesis - MIT
Jonathan E. Snow Jun. 1993 353 p Sponsored by NSF and the Ocean Ventures Fund Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A279435; WHOI-93-36) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The mantle origin of abyssal peridotites and their alteration by hydrothermal solutions and seawater have been the object of intensive study in the scientific community in recent years. Abyssal peridotites from the American-Antarctic and southwest Indian ridges were studied using major elements, trace elements and the isotopic compositions of Nd, Sr and Os. These studies reveal the nature of the mantle these abyssal peridotites were once a part of, and the nature of alteration processes the peridotites have undergone during and after their emplacement on the sea floor. The major conclusions of this dissertation are as follows: Abyssal peridotites have lost significant Mg during their weathering on the seafloor. Abyssal peridotites are altered at low temperatures and high water/rock ratios during this process. The water/rock ratios during alteration are high enough to compromise the Sr, Nd and Os isotopic systems in bulk peridotite. 'Orphan' 87Sr detected in alteration products is due to the mechanical entrainment of sediment particles into the peridotite. Mantle Os and Nd isotopic compositions detected do not conform to current models for the formation of the depleted mantle. DTIC

THE DYNAMIC ROLE OF RIDGES IN A BETA-PLANE CHANNEL. TOWARDS UNDERSTANDING THE DYNAMICS OF LARGE SCALE CIRCULATION IN THE SOUTHERN OCEAN Ph.D. Thesis - MIT

Liping Wang Sep. 1993 255 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant NSF OCE-90-17158)
(AD-A279390; WHOI-93-38) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

In this thesis, the dynamic role of bottom topography in a Beta-plane channel is systematically studied in both linear homogeneous and stratified layer models in the presence of either wind stress or buoyancy forcing. In these studies, the structure of the geostrophic contour plays a fundamental role, and the role of bottom topography is looked at from two different angles. It is shown that blocking all the geostrophic contours leads to two different physical processes in which bottom topographic form drag is generated and enables geostrophic flow in a Beta- plane channel to support a net cross-channel volume transport. It is demonstrated that by blocking all the geostrophic contours in the presence of a sufficiently high ridge, the dynamics of both source-sink and wind driven circulations in a Beta-plane is similar to that in a closed basin. ACOUSTIC THERMOMETRY OF OCEAN CLIMATE (ATOC): SELECTION OF CALIFORNIA SOURCE SITE
Bruce M. Howe Nov. 1993 27 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract MDA972-93-1-0003)
(AD-A279295; APL-UW-TM30-93) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This report discusses the general criteria for choosing a site for ATOC (Acoustic Thermometry of Ocean Climate) cabled sources. In particular, the process of selecting the California site is reviewed. Two possible locations are considered: Pioneer Seamount and Sur Ridge. The Sur Ridge site has been selected because a requisite marine mammal research program can be conducted there for less cost. DTIC

RAPID DETERMINATION OF GEOACOUSTIC PROPERTIES OF THE SEA FLOOR BY SIMULATED ANNEALING Final Report
Dennis Lindwall 9 Sep. 1994 13 p
(AD-A286297; NRL/MR/7432-94-7548) Avail: CASI HC A03/MF A01

The Naval Research Laboratory (NRL) developed and tested a simulated annealing (SA) inversion method for geoacoustic data. Significant improvements in the classical Metropolis SA algorithm improved the speed and accuracy of the SA method. This method solves for compressional and shear wave velocities, layer thicknesses, density, and attenuation when the data are sensitive to these properties. NRL demonstrated the effectiveness of the SA method with a realistic geological case that is a nonlinear problem with several traps that foil other inversion methods. DTIC

EXCHANGES BETWEEN HEMISPHERES AND GYRES: A DIRECT APPROACH TO THE MEAN CIRCULATION OF THE EQUATORIAL PACIFIC Ph.D. Thesis - MIT
Susan Elizabeth Wijffels Sep. 1993 263 p Sponsored by NASA Scholarship in Global Change Research and Caltex Graduate Woman National Scholarship Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant NSF OCE-87-16910)
(NASA-CR-196311; NAS 1.26:196311; AD-A279437; WHOI-93-42) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The pathways for cross-equatorial and cross-gyre exchange are studied with an extensive set of new high-quality hydrographic data. Use of repeat surveys or comparison with historical data ensured that the data reflect mean conditions. An inverse model adjusts the circulation such that volume, heat and salt are conserved in subthermocline layers. Cross-equatorial flow is achieved in the abyss in a deep western boundary current which transports 10 Sv (1x10(exp 6)/cu m/s) of dense Southern Ocean water into the North Pacific. This flow returns southward as warmer deep water, crossing the equator in the interior by some unknown mechanism. In the upper ocean, subtropical gyre waters flow equatorward and entrain in the eastward equatorial currents which in turn feed the eastern Pacific upwelling system. The upwelled waters supply the South Equatorial Current, accounting for a larger transport than predicted by Sverdrup theory. Surface northward flow across the equator in the western Pacific supplies the North Pacific Ekman flux. The Pacific Ocean does not convert large mounts of abyssal to thermocline water, as required by several theories of the global thermohaline circulation. The Pacific-Indian throughflow is essentially zero, though an error analysis allows a range of 0-8 Sv. DTIC

[SEISMIC ANISOTHROPY AND LARGE-SCALE POROSITY INTHE OCEAN FLOOR] Final Technical Reports
1 Sep. 1994 393 p Limited Reproducibility: More than 20% of this document may be affected by poor print
(Contract N00014-87-K-0181)
(AD-A286580) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Research goals include a description and modeling of the kinematical structure and dynamical processes of oceanic motions that have horizontal scales from a few meters to a few kilometers, understanding the role that these small-scale motions play in the redistribution and mixing of momentum, potential vorticity heat, and salt. Our objective is to identify the processes that affect the kinematical and dynamical evolution of near-inertial internal gravity waves, especially those processes that can transfer energy out of near-inertial internal waves into the internal wave continuum. The acoustic multipaths from the Kaneohe source have been identified at one SOSUS station using a ray tracing algorithm called ZRAY. This is the furthest, 4000 km, that ray theory has been successfully used to understand acoustic propagation in the ocean. This further validates that acoustic thermometry is valid at basin-scales and that changes in the travel time from the Kaneohe source are not due to changes in the multipaths. FSU designed an acoustic tomography assimilation scheme for a reduced gravity model, but with spatially variable density. The goal of this effort is to estimate the time independent density field in the upper northeast Pacific ocean. A second test cruise was conducted at the AUTEC Range in August to verify SSAR performance with a 70 Hz source. This test consisted of the deployment of a normal SSAR (Snubber design) and a moored SSAR. The moored SSAR was deployed on a subsurface mooring, thus removing surface generated noise. A 70 Hz source transmitted an M-sequence signal and both systems recorded data on hard disk. The normal SSAR also telemetered processed data. In addition, the SSAR acoustic navigation system was tested against the AUTEC Range system. All data were successfully collected and processing of this information is ongoing. DTIC

A PHOTOPHYSICAL CONTROL MECHANISM FOR ZEAXANTHIN-ASSOCIATED RADIATIONLESS ENERGY DISSIPATION IN PHOTOSYNTHESIS
Harry A. Frank (Connecticut Univ., Storrs, CT.), Agnes Cua (Connecticut Univ., Storrs, CT.), Andrew Young (Liverpool Univ., England.), David Gosztola, and Michael R. Wasielewski 1994 10 p
(Contract W-31-109-eng-38)
(DE94-018383; ANL/CHM/CP-80107) Avail: CASI HC A02/MF A01

Understanding the way in which excess solar energy is dissipated by photosynthetic membranes under high light stress is a major problem in photosynthesis studies. This paper reports femtosecond time-resolved, fast-transient optical spectroscopic analyses of three important xanthophylls: violaxanthin, antheraxanthin, zeoaxanthin. The results support the notion that the enzymatic reactions that interconvert these xanthophylls act as a kind of 'molecular gear shift' controlling whether the molecules function as light-harvesting pigments performing forward energy transfer or as fluorescence quenchers performing reverse energy transfer. How does the brain recognize three-dimensional objects? We trained monkeys to recognize computer rendered objects presented from an arbitrarily chosen training view, and subsequently tested their ability to generalize recognition for other views. Our results provide additional evidence in favor of a recognition model that accomplishes view-invariant performance by storing a limited number of object views or templates together with the capacity to interpolate between the templates. A very important objective of the Detection Directorate at the U.S. Army Edgewood Research, Development and Engineering Center is the remote detection of biological materials in the field. One line of thinking, currently being followed, is the recognition that sugars are distinguishing features of biological materials. In Part 1 of this study, the theoretical prediction of the vibrational circular dichroism (VCD) of the 3 and 4 carbon sugars R-glyceraldehyde, R-erythrose, and R-threose is considered. The calculational procedure used involves determination of the frequencies corresponding to the normal modes of vibration. Since calculated frequencies at the Hartree-Fock level are typically 10% too high, some form of scaling of the frequencies or the force constant matrix is required for quantitative agreement with experimental measurements. In Part 2 of this study, a scaling method is described, and three key FORTRAN computer programs are presented. Basically, the force constant matrix in internal coordinates at the 6-31G HF level of calculation is scaled to the calculated 6-31G MP2 level of calculation. The force constant matrix in terms of Cartesian coordinates can be determined from a matrix transformation, originally shown by Pulay, involving the force constant matrix in terms of internal coordinates. The scaling constant for each off-diagonal element of the force constant matrix was determined by using the geometric mean Q(sub ij) = ((Q sub i)(Q sub j))(exp 1/2) of the diagonal scaling constants (Q sub i) and (Q sub j). ANAEROBIC DIGESTION ANALYSIS MODEL: USER'S MANUAL
M. Ruth and R. Landucci Aug. 1994 79 p
(Contract DE-AC36-83CH-10093)
(DE94-011858; NREL/TP-421-6331) Avail: CASI HC A05/MF A01

The Anaerobic Digestion Analysis Model (ADAM) has been developed to assist investigators in performing preliminary economic analyses of anaerobic digestion processes. The model, which runs under Microsoft Excel(trademark), is capable of estimating the economic performance of several different waste digestion process configurations that are defined by the user through a series of option selections. The model can be used to predict required feedstock tipping fees, product selling prices, utility rates, and raw material unit costs. The model is intended to be used as a tool to perform preliminary economic estimates that could be used to carry out simple screening analyses. The model's current parameters are based on engineering judgments and are not reflective of any existing process; therefore, they should be carefully evaluated and modified if necessary to reflect the process under consideration. The accuracy and level of uncertainty of the estimated capital investment and operating costs are dependent on the accuracy and level of uncertainty of the model's input parameters. The underlying methodology is capable of producing results accurate to within +/- 30% of actual costs. DOE

MONOCLONAL ANTIBODIES DIRECTED AGAINST SURFACE MOLECULES OF MULTICELL SPHEROIDS Semiannual Progress Report, 1 Jul. - 31 Dec. 1994
Andrew O. Martinez 31 Dec. 1994 25 p
(Grant NAG2-819)
(NASA-CR-197367; NAS 1.26:197367) Avail: CASI HC A03/MF A01

The objective of this project is to generate a library of monoclonial antibodies (MAbs) directed against surface molecules of tumor and transformed cells grown as multicell spheroids (MCS). These MCS are highly organized, 3-dimensional multicellular structures which exhibit many characteristics of in vivo organized tissues which are not found in conventional monolayer or suspension culture. In brief, MCS combine the relevance or organized tissues with in vitro methodology making the MCS a good model system to study the interactions of mammalian cells, and thereby provide a functional assay for surface adhesion molecules. This project also involves investigations of cell-cell interactions in a gravity-based environment. It will provide an important base of scientific information for future comparative studies on the effects of hypergravity and simulated microgravity environments on cell-cell interactions. This project also has the potential to yield important materials (e.g. cellular products) which may be useful for the diagnosis and/or treatment of certain human diseases. Moreover, this project supports the training of one undergraduate and one graduate student; thus, it will also assist in developing a pool of future scientists with research experience in gravitational biology research. BACTERIAL LUCIFERASE: DETERMINATION OF THE STRUCTURE BY X-RAY DIFFRACTION Final Report, 1 May 1992 - 31 Dec. 1993
Miriam M. Ziegler and Thomas O. Baldwin 20 May 1994 73 p Limited Reproducibility: More than 20% of this document may be affected by

microfiche quality
(Contract N00014-92-J-1900)
(AD-A279699) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This project was focused on determination of the three-dimensional structure of bacterial luciferase. The structure of the enzyme is of fundamental importance to the understanding of the catalytic mechanism and the mode of interaction of the enzyme with accessory proteins, and is essential to future plans to develop biosensor technologies. In the course of this project, numerous crystallization trials were carried out and conditions were refined that permitted high resolution data to be collected and interpreted. In collaboration with Dr. Ivan Rayment of the University of Wisconsin, data have been collected from native crystals and 3 derivatives at 2.8 A. Higher resolution data are being collected at this time, and we fully expect to have a high resolution structure within the next few months, certainly by the end of the calendar year 1994. We have also developed crystallization protocols for several mutant luciferases. Structural analysis of the mutant luciferases should enable us to locate the active site in the three-dimensional structure of the wild-type enzyme, permit mechanistic interpretation of numerous experiments that have been reported over the past ca. 25 years, and assist us in designing the next generation of mutant enzymes to test hypotheses regarding the mechanism of light production by this intriguing and important enzyme. IN VIVO DISTRIBUTION OF LIPOSOME ENCAPSULATED HEMOGLOBIN STUDIED WITH IMAGING RADIOTRACERS Final Technical Report, 1 Dec. 1990 - 31 Mar. 1994
William T. Phillips 31 Mar. 1994 117 p
(Contract N00014-91-J-1217)
(AD-A279774) Avail: CASI HC A06/MF A02

The objective of this project was to develop radiotracer imaging technology to follow the in vivo circulation and organ deposition of liposome encapsulated hemoglobin (LEH). A liposome labeling technique based on the most common radioisotope used in nuclear medicine, technetium-99m (99m Tc), was developed and patented. A comparison of this 99mTc-liposome labeling method with previous methods using indium-111 (In-111) was performed. The label LEH was infused into small animals to monitor any in vivo differences between different LEH formulations (bovine hemoglobin, recombinant human hemoglobin, human hemolysate, lyophilized) using gamma scintigraphy and tissue biodistribution determination. These studies were correlated with any hematological and pathological changes associated with LEH treatment such as the interaction of LEH with circulating platelets using indium-111-labeled platelets. MICROBIOLOGY AND PHYSIOLOGY OF ANAEROBIC FERMENTATIONS OF CELLULOSE
H. D. Peck, Jr., L. G. Ljungdahl, L. E. Mortenson, and J. K. W. Wiegel 1994 26 p
(Contract DE-FG09-86ER-13614)
(DE95-002899; DOE/ER-13614/T1) Avail: CASI HC A03/MF A01

This project studies the biochemistry and physiology of four major groups (primary, secondary, ancillary and methane bacteria) of anaerobic bacteria, that are involved in the conversion of cellulose to methane or chemical feedstocks. The primary bacterium, Clostridium thermocellum, has a cellulolytic enzyme system capable of hydrolyzing crystalline cellulose and consists of polypeptide complexes attached to the substrate cellulose with the aid of a low molecular yellow affinity substance (YAS) produced by the bacterium in the presence of cellulose. Properties of the complexes and YAS are studied. Aspects of metabolism are being studied which appear to be relevant for the interactions on consortia and their bioenergetics, particularly related to hydrogen, formate, CO, and CO2. The roles of metals in the activation of H2 are being investigated, and genes for the hydrogenases cloned and sequenced to established structural relationships among the hydrogenases. The goals are to understand the roles and regulation of hydrogenases in interspecies H2 transfer, H2 cycling and the generation of a proton gradient. The structures of the metal clusters and their role in the metabolism of formate will be investigated with the goal of understanding the function of formate in the total synthesis of acetate from CO2 and its role in the bioenergetics of these microorganisms. Additionally, the enzyme studies will be performed using thermophiles and also the isolation of some new pertinent species. The project will also include research on the mechanism of extreme thermophily (growth over 70 deg) in bacteria that grow over a temperature span of 40C or more. These bacteria exhibit a biphasic growth response to temperature and preliminary evidence suggests that the phenomenon is due to the expression of a new set of enzymes. These initial observations will be extended employing techniques of molecular biology. DOE

ATTEMPT TO INTERPRET THE SELF-ORGANIZING MAPPING PHYSIOLOGICALLY
Teuvo Kohonen Nov. 1993 24 p
(ISSN 0783-7445)
(PB95-127783; ISBN-951-22-1291-9) Avail: CASI HC A03/MF A01

It is argued that the Self-Organizing Map (SOM) may be implemented in biological neural networks by partly neural, partly chemical mechanisms. For the Winner Take All function a laterally connected network seems proper. The active forgetting relating to the automatic normalization of the synaptic strengths in learning is thought to ensure from competition on postsynaptic resources. The neighborhood function needed in the SOM algorithm is most effectively implemented by chemical agents, which are formed or released in the neighborhood of highly active cells. These agents are thought to control the synaptic plasticity. Such a physiological model then behaves in the same way as the idealized SOM algorithm, which has been found very effective in many information-processing applications. NTIS

To understand the functioning of living organisms on a molecular level, it is crucial to dissect the intricate interplay of the immense number of biological molecules. Most of the biochemical processes in cells occur in a liquid environment formed mainly by water and ions. This solvent environment plays an important role in biological systems. The potential-of-mean-force (PMF) formalism attempts to describe quantitatively the interactions of the solvent with biological macromolecules on the basis of an approximate statistical-mechanical representation. At its current status of development, it deals with ionic effects on the biomolecular structure and with the structural hydration of biomolecules. The underlying idea of the PMF formalism is to identify the dominant sources of interactions and incorporate these interactions into the theoretical formalism using PMF's (or particle correlation functions) extracted from bulk-liquid systems. In the following, the authors shall briefly outline the statistical-mechanical foundation of the PMF formalism and introduce the PMF expansion formalism, which is intimately linked to superposition approximations for higher-order particle correlation functions. The authors shall then sketch applications, which describe the effects of the ionic environment on nucleic-acid structure. Finally, the authors shall present the more recent extension of the PMF idea to describe quantitatively the structural hydration of biomolecules. Results for the interface of ice and water and for the hydration of deoxyribonucleic acid (DNA) will be discussed. DOE

This paper describes a tutorial to introduce the Minimal length encoding

(MLE) method to computational biologists who are designing sequence analysis algorithms, to computer scientists who are interested in learning more about macromolecular sequence analysis, and to biologists who are more advanced users of the sequence analysis programs. An emphasis of the workshop will be on the use of the MLE method as a tool for comparative analysis of inference programs in computational biology, with an ultimate purpose of providing more methodological coherence to the emerging field of computational biology. NITROGEN CONTROL OF CHLOROPLAST DIFFERENTIATION
Gregory W. Schmidt 1994 6 p
(Contract DE-FG09-84ER-13188)
(DE95-002797; DOE/ER-13188/9) Avail: CASI HC A02/MF A01

This project was directed toward understanding how the availability of nitrogen affects the accumulation of chloroplast pigments and proteins that function in energy transduction and carbon metabolism. The availability of this nutrient most pervasively limits plant growth and agricultural productivity but the molecular and physiological consequences of nitrogen-deficiency are poorly understood. The model system for our studies of nitrogen-dependent regulation of chloroplast differentiation is the unicellular green alga Chlamydomonas reinhardtii which is grown phototrophically in a continuous culture system. When 150 micrometers nitrogen is provided at a dilution rate of 0.25 volumes of the growth medium per day, the cultures are sustained at a density of less than 10(exp 5) cells/ml and chlorophyll deficiency, the classical symptom of nitrogen-deficiency, becomes quite pronounced. We found that there is a concomitant loss of light-harvesting complexes and reduced levels of Photosystem II reaction center complexes while ATP synthetase and Photosystem I reaction centers are maintained at high levels. Moreover, reduced rates of chloroplast protein synthesis are due to differential effects on mRNA translation. In contrast, the deficiency of light-harvesting genes is due to marked reductions of the nuclear-encoded cab mRNA's. Although there is no significant reduction of the amounts of RuBPCase, we also detected substantial changes in the mRNA abundance of the alga's two small subunit genes. All of the effects of nitrogen-limitation are readily reversible: greening of cells is completed within 24 hours after provision of 10 mM ammonium. During this time, the plastid translational constraints are disengaged and progressive changes in the abundance of nuclear transcripts occur, including a transient 30-fold elevation of (und cab) mRNA's. DOE

ANNUAL PROGRAM ANALYSIS OF THE NASA SPACE LIFE SCIENCES RESEARCH AND EDUCATION SUPPORT PROGRAM Report, 1 Dec. 1993 - 30 Nov. 1994
30 Nov. 1994 42 p
(Contract NAS9-18440)
(NASA-CR-197298; NAS 1.26:197298) Avail: CASI HC A03/MF A01

The basic objectives of this contract are to stimulate, encourage, and assist research and education in NASA life sciences. Scientists and experts from a number of academic and research institutions in this country and abroad are recruited to support NASA's need to find a solution to human physiological problems associated with living and working in space and on extraterrestrial bodies in the solar system. To fulfill the contract objectives, a cadre of staff and visiting scientists, consultants, experts, and subcontractors has been assembled into a unique organization dedicated to the space life sciences. This organization, USRA's Division of Space Life Sciences, provides an academic atmosphere, provides an organizational focal point for science and educational activities, and serves as a forum for the participation of eminent scientists in the biomedical programs of NASA. The purpose of this report is to demonstrate adherence to the requirement of Contract NAS9-18440 for a written review and analysis of the productivity and success of the program. In addition, this report makes recommendations for future activities and conditions to further enhance the objectives of the program and provides a self-assessment of the cost performance of the contract. HYPERVOLEMIA IN MEN FROM DRINKING HYPERHYDRATION FLUIDS AT REST AND DURING EXERCISE
J. E. Greenleaf, R. LooftWilson, P. P. Wisherd, P. P. Fung, A. C. Ertl, C. G. R. Jackson, P. R. Barnes, and L. G. Wong (Shaklee US, Inc., San Francisco, CA.) Dec. 1994 55 p
(RTOP 199-18-12-07)
(NASA-TM-4657; A-94138; NAS 1.15:4657) Avail: CASI HC A04/MF A01

To test the hypothesis that drink composition is more important than drink osmolality (Osm) for maintaining and increasing plasma volume (PV) at rest and during exercise, six men (22-39 yr, 76.84 +/- 16.19 kg, 2.99 +/- 0.45 L/min VO2 peak) each underwent six treatments while sitting for 90 min (VO2 = 0.39 L/min) and then performed upright ergometer exercise for 70 min (VO2 = 2.08 +/- 0.33 1/min, 70% +/- 7% VO2 peak). Drink formulations (10 ml/kg body weight, X = 768 ml) for the sitting period were: P1 (55 mEq Na(+), 365 mOsm/kg H2O), P2 (97.1 mEq Na(+), 791 mOsm/kg), P2G (113 mEqNa(+), 80 ml glycerol, 1,382 mOsm/kg, HyperAde (HA) (164 mEq Na(+), 253 mOsm/kg), and 01 and 02 (no drinking). The exercise drink (10 ml/kg, 768 ml) was P1 for all treatments except 02. Plasma volume at rest increased (p less than 0.05) by 4.7% with P1 and by 7.9% with HA. Percent change in PV during exercise was +1% to +3%0(NS) with HA; -6% to 0% (NS) with P1, P2, P2G, and 01; and -8% to -5% (p less than 0.05) with 02. HyperAde, with the lowest osmolality (253 mOsm/kg), maintained PV at rest and during exercise, whereas the other drinks with lower Na(+) and higher osmolality (365 to 1,382 mOsm/kg) did not. But Performance 1 also increased PV at rest. Thus, drink composition may be more important than drink osmolality for increasing plasma volume at rest and for maintaining it during exercise. Author

CELL MEMBRANE POTENTIALS INDUCED DURING EXPOSURE TO EMP FIELDS
P. C. Gailey and C. E. Easterly 1994 8 p Presented at the Theater Nuclear Warfare Program, Williamsburg, VA, 16-18 Mar. 1993
(Contract DE-AC05-84OR-21400)
(DE94-018952; CONF-9303304-1) Avail: CASI HC A02/MF A01

Internal current densities and electric fields induced in the human body during exposure to EMP fields are reviewed and used to predict resulting cell membrane potentials. Using several different approaches, membrane potentials of about 100 mV are predicted. These values are comparable to the static membrane potentials maintained by cells as a part of normal physiological function, but the EMP-induced potentials persist for only about 10 ns. Possible biological implications of EMP-induced membrane potentials including conformational changes and electroporation are discussed. DOE

THE MOLECULAR MECHANICS PROGRAM DUPLEX: COMPUTING STRUCTURES OF CARCINOGEN MODIFIED DNA BY SURVEYING THE POTENTIAL ENERGY SURFACE
B. E. Hingerty and S. Broyde (New York Univ., New York, NY.) 1994 16 p Presented at the 27th Jerusalem Symposium in Quantum Chemistry and Biochemistry, Jerusalem, Israel, 23-26 May 1994
(Contracts DE-AC05-84OR-21400; DE-FG02-90ER-60931)
(DE94-019153; CONF-9405196-2) Avail: CASI HC A03/MF A01

The nucleic acids molecular mechanics program DUPLEX has been designed with useful features for surveying the potential energy surface of polynucleotides, especially ones that are modified by polycyclic aromatic carcinogens. The program features helpful strategies for addressing the multiple minimum problem: (1) the reduced variable domain of torsion angle space; (2) search strategies that emphasize large scale searches for smaller subunits, followed by building to larger units by a variety of strategies; and (3) the use of penalty functions to aid the minimizer in locating selected structural types in first stage minimizations (penalty functions are released in terminal minimizations to yield final unrestrained minimum energy conformations). Predictive capability is illustrated by DNA modified by activated benzo(a)pyrenes. DOE

EFFECTS OF INCREASED UV-B RADIATION ON PHYTOPLANKTON: A PRELIMINARY STUDY AND RESEARCH PROGRAMME
Arnold Veen Feb. 1993 32 p See also DE88-753545 Sponsored by Dutch National Research Programme on Global Air Pollution and Climate Change
(PB95-133732; RIVM-731054001) Avail: CASI HC A03/MF A01

The depletion of the ozone layer through actions of, for instance, chlorine containing catalysts is expected to result in an increased UV-B irradiance. Since phytoplankton is known to be sensitive to this radiation, effects on global primary production cannot be excluded. The preliminary results in semi-continuous culture experiments indicated that algae differ widely in their response to UV-B radiation. Desmid and diatom species were much more sensitive than green algae. Furthermore, the experiments emphasized the importance of an accurate dosimetry, so the next step was to build a continuous culture system with steering software to simulate natural photosynthetic light regimes and UV-B simultaneously, and study the effect on growth rate and other physiological parameters. The culture system was designed to allow for exact quantification of the UV-B exposure. Finally a list of publications is presented that were necessary to build the system and its steering components, and gave background information on reactions of both photosynthetic light and UV-B radiation on phytoplankton. LIFE SCIENCES DIVISION AND CENTER FOR HUMAN GENOME STUDIES Progress Report, 1992-1993
Morton Bradbury, comp., Scott Cram, comp., and Carolyn Stafford, comp. Jul. 1994 94 p
(Contract W-7405-eng-36)
(DE94-017796; LA-12754-PR) Avail: CASI HC A05/MF A01

This report summarizes the research and development activities of the Los Alamos National Laboratory's Life Sciences Division and the biological aspects of the Center for Human Genome Studies for the calendar years 1992 and 1993. The technical portion of the report is divided into two parts: (1) selected research highlights; and (2) research projects and accomplishments. The research highlights provide a more detailed description of a select set of projects. A technical description of all projects is presented in sufficient detail to permit the informed reader to assess their scope and significance. Summaries useful to the casual reader desiring general information have been prepared by the group leaders and appear in each group overview. Investigators on the staff of Life Sciences Division will be pleased to provide further information. DOE

DISCOVERING RELATED DNA SEQUENCES VIA MUTUAL INFORMATION
A. Milosavljevic 1994 17 p
(Contracts W-31-109-eng-38; DE-FG03-91ER-61152)
(DE95-001101; ANL/CMB/PP-81002) Avail: CASI HC A03/MF A01

One of the problems in DNA and protein sequence comparisons is to decide whether the observed similarity should be explained by their relatedness or by the mere presence of some shared internal structure, e.g., shared internal repetitive patterns. Machine discovery of related DNA sequences critically depends on a solution to this problem. In this paper we propose a general solution that is based on minimal length encoding: we measure mutual information between two sequences as the difference between the encoding length of one of the sequences sequence and its encoding length relative to the other sequence; two sequences are considered similar if the mutual information exceeds a threshold of significance; the significance is determined using an extension of the newly proposed algorithmic significance method. We show that mutual information factors out sequence similarity that is due to shared internal structure and thus enables discovery of truly related sequences. In addition to this general method, we also propose an efficient way to compare sequences based on their subword composition that does not require any a priori assumptions about k-tuple length. DOE

ELECTROSTATIC BASIS FOR MOLECULAR RECOGNITION IN PHOTOSYNTHESIS
D. M. Tiede, A. C. Vashista, and M. R. Gunner (City Coll. of the City Univ. of New York, NY.) 1994 6 p
(Contract W-31-109-eng-38)
(DE95-002979; ANL/CHM/PP-79997) Avail: CASI HC A02/MF A01

An electrostatic basis for molecular recognition in photosynthesis has been found, based upon calculations from the crystal structure of the Rhodobacter sphaeroides photosynthetic reaction center, and supported by experimental measurements of water-soluble c-cytochrome docking on the reaction center. Besides providing a physical explanation for molecular recognition in photosynthesis, this work is significant because it is a starting point for the examination of the role for electrostatics in the incorporation of membrane proteins into crystals and other ordered arrays that have potential for molecular device applications. Solar energy conversion in photosynthesis requires that reactive, bimolecular electron-transfer complexes are formed between the reaction center, the protein that carries out the initial conversion of solar energy to chemical energy, and specific secondary electron donors and acceptors. The molecular basis for recognition between the reaction center and its photosynthetic partners is determined by the charge and chemical properties of the associated proteins. This work identified a likely electrostatic mechanism for assembly of electron transfer complexes between the reaction center from Rb. sphaeroides and a series of structurally homologous water-soluble c-cytochromes by identifying correlations between electron transfer and electrostatic properties of the reaction center and the various c-cytochromes. The kinetics of electron transfer between the reaction center and nine soluble c-cytochromes were analyzed and compared to the patterns of the surface electrostatic potentials for each of the proteins. FLOW CYTOMETRY: A POWERFUL TECHNOLOGY FOR MEASURING BIOMARKERS
J. H. Jett 1994 17 p Presented at the Workshop on Development and Application of Biomarkers, Santa Fe, NM, 26-29 Apr. 1994
(Contract W-7405-eng-36)
(DE94-018284; LA-UR-94-2831; CONF-9404178-1) Avail: CASI HC A03/MF A01

A broad definition of a biomarker is that it is a measurable characteristic of a biological system that changes upon exposure to a physical or chemical insult. While the definition can be further refined, it is sufficient for the purposes of demonstrating the advantages of flow cytometry for making quantitative measurements of biomarkers. Flow cytometry and cell sorting technologies have emerged during the past 25 years to take their place alongside other essential tools used in biology such as optical and electron microscopy. This paper describes the basics of flow cytometry technology, provides illustrative examples of applications of the technology in the field of biomarkers, describes recent developments in flow cytometry that have not yet been applied to biomarker measurements, and projects future developments of the technology. The examples of uses of flow cytometry for biomarker quantification cited in this paper are meant to be illustrative and not exhaustive in the sense of providing a review of the field. DOE

Because heat shock proteins are made by all organisms in response to environmental stress, it has been proposed that accumulation of these proteins could be useful in environmental monitoring. In order to use the accumulation of heat shock proteins as indicators of environmental stress, it is important to understand how their stability is regulated. This research is concerned with determining the influences that regulate the stability of the major heat shock protein, hsp7O, in rainbow trout (used for environmental monitoring) and in fruit files (a well characterized system used for basic research). During the tenure of this grant progress has been made characterizing the rainbow trout heat shock response, cloning and sequencing the rainbow trout heat shock gene, and in generating antibodies specific for fruit fly and rainbow trout hsp7O. The accumulation of hsp7O in juvenile rainbow trout exposed to heavy metals has been assessed in collaboration with the H. Berman Lab. Commercially available antibodies have been used to identify hsp7O breakdown products in flies, trout, chick, and mouse, and the sequences of the major breakdown fragments of the fly hsp7O generated in vivo have been determined. THORIUM-232 IN HUMAN TISSUES: METABOLIC PARAMETERS AND RADIATION DOSES
A. F. Stehney 1994 58 p
(Contract W-31-109-eng-38)
(DE94-019275; ANL/BIM/PP-70108) Avail: CASI HC A04/MF A01

Higher than environmental levels of Th-232 have been found in autopsy samples of lungs and other organs from four former employees of a Th refinery. Working periods of the subjects ranged from 3 to 24 years, and times from end of work to death ranged from 6 to 31 years. Concentrations of Th-232 in these samples and in tissues from two cases of non-occupational exposure were examined for compatibility with dosimetric models in Publication 30 of the International Commission on Radiological Protection (ICPP 1979a). The concentrations of Th-232 in the lungs of the Th workers relative to the concentrations in bone or liver were much higher than calculated from the model for class Y aerosols of Th and the exposure histories of the subjects, and concentrations in the pulmonary lymph nodes were much lower than calculated for three of the Th workers and both non-occupational cases. Least-squares fits to the measured concentrations showed that the biological half-times of Th in liver, spleen, and kidneys are similar to the half-time in bone instead of the factor of 10 less suggested in Publication 30, and the fractions translocated from body fluids were found to be about 0.03, 0.02, and 0.005, respectively, when the fraction to bone was held at the suggested value of 0.7. Fitted values of the respiratory parameters differed significantly between cases and the differences were ascribable to aerosol differences. Average inhalation rates calculated for individual Th workers ranged from 50 to 110 Bq Th-232 y(sup -1), and dose equivalents as high as 9.3 Sv to the lungs, 2.0 Sv to bone surfaces, and 1.1 Sv effective dose equivalent were calculated from the inhalation rates and fitted values of the metabolic parameters. The radiation doses were about the same when calculated from parameter values fitted with an assumed translocation fraction of 0.2 from body fluids to bone instead of 0.7. DOE

A PHYSIOLOGICAL NEURAL NETWORK FOR SACCADIC EYE MOVEMENT CONTROL Final Report, 26 Feb. 1991 - 1 Feb. 1994
John D. Enderle Apr. 1994 56 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F33615-90-D-0606)
(AD-A279599; AL/AO-TR-1994-0023) Avail: CASI HC A04

Based on electrophysiological evidence, eye-movement measurements and systems control theory, a new physiological neural network model of horizontal saccadic control is described. The neural control mechanism is first-order, time-optimal, and is initiated by the deep layers of the superior colliculus and terminated by the cerebellar fastigial nucleus. The neural circuit consists of neurons in the paramedian pontine reticular formation, the vestibular nucleus, abducens nucleus, oculomotor nucleus, cerebellum, substantia nigra, nucleus reticularis tegmenti pontis, the thalamus, the deep layers of the superior colliculus and the oculomotor plant for each eye. Each of the neural sides in the model produce firing rates matching experimental data, and simulate fast eye movements that match the recorded data extremely well for saccades of all sizes. All features of these simulations, including peak velocity, duration, and amplitude conform to published observations. DTIC

BEHAVIORAL EFFECTS OF TYROSINE DURING SUSTAINED WAKEFULNESS
D. L. Wiegmann, D. F. Neri, R. R. Stanny, S. A. Shappell, and A. H. McCardie Dec. 1993 25 p
(NR Proj. MM3-3-P-30)
(AD-A279789; NAMRL-1392) Avail: CASI HC A03/MF A01

The fatigue and cognitive performance deficits associated with sleep loss and stress, like that experienced during sustained flight operations and nighttime flying, have motivated the search for effective nonpharmacological countermeasures. The behavioral effects of the potential countermeasure tyrosine, an amino-acid precursor to dopamine and norepinephrine, were examined during an episode of continuous nighttime work involving one night's sleep loss. Volunteers performed nine iterations of a battery of cognitive and subjective tasks for approximately 13 h, beginning at 1930 and ending at 0820 the following morning. Subjects remained awake throughout the day on which the experiment began and were awake for approximately 24 h by the end of testing. Six hours after the start of the experiment, one-half of the subjects received 150 mg/kg tyrosine in a split dose while the other half received a cornstarch placebo in a double-blind procedure. The tracking-task performance of tyrosine subjects declined less during the night than that of placebo subjects. Tyrosine administration was also associated with nonsignificant trends toward reducing: (1) lapses on a high-event-rate vigilance task; (2) subjective sleepiness; and (3) the intensities of several fatigue-related symptoms. A method for non-invasive evaluation of diaphragmatic function in humans measures the thickness of the diaphragm in real time with an ultrasonic device, and displays the variations of diaphragm thickness versus time. Formulae are given for calculating a quantitative value for the reserve fatigue capacity of a patient's diaphragm from data obtained by measuring the time limits for maintaining a constant breathing pattern on the display at two different pressure differentials in series with the patient's airways. An apparatus for displaying the diaphragm thickness in real time is also described. The method can be used both on healthy patients and on patients with so severe breathing dysfunctions that they require breathing support from respirators. Author

MODELING PLATFORM DYNAMICS AND PHYSIOLOGICAL RESPONSE TO SHORT ARM CENTRIFUGATION Final Report, 7 May - 17 Dec. 1993
David J. Pancratz, John B. Bomar, Jr., and James H. Raddin, Jr. Mar. 1994 182 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F41624-93-C-6011)
(AD-A279640; AL/CF-TR-1994-0025) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

An analysis is presented for the operation of a short radius centrifuge on an orbiting platform. A review of literature confirms that such a centrifuge could be useful in ameliorating the effects of microgravity deconditioning of astronauts. Our analysis indicates that operation of the centrifuge could generate potentially destabilizing forces and moments. Several ideas for reducing or eliminating the forces and moments are discussed. The use of pedals to drive the centrifuge and exercise the rider is also described. Excess power from pedalling could be stored as electrical energy. A mathematical model of the human cardiovascular system indicates that centrifugation at a short radius would indeed stimulate the heart, even though there is a significant acceleration gradient from head to toe. Consideration of the disorienting effects of short radius centrifugation reveals that discomfort originating in the otoliths from the lack of gravity would probably be alleviated; however, the angular motion of the centrifuge would likely cause disorientation or discomfort through the semicircular canals. INTERSPECIES EXTRAPOLATIONS OF HALOCARBON RESPIRATORY AND TISSUE KINETICS: APPLICATIONS TO PREDICTING TOXICITY IN DIFFERENT SPECIES Annual Report, 15 Jul. 1993 - 14 Jul. 1994
Cham E. Dallas, J. V. Bruckner, R. L. Tacket, and T. Reigle 15 Aug. 1994 167 p
(Grant AF-AFOSR-0356-91)
(AD-A285055; AFOSR-94-0558TR) Avail: CASI HC A08/MF A02

A series of experiments have been conducted to provide a pharmacokinetic data base for interspecies comparisons and for formulation and validation of physiologically-based pharmacokinetic models. The basic experimental design has involved giving equal doses of halocarbons in different species, including mice, rats, and dogs. Perchloroethylene (PCE), tetrachloroethane (TET), trichloroethylene (TCE), and trichloroethane (TRI) have been employed as test chemicals, in order to evaluate the relative importance of the physicochemical property of volatility on the kinetics and toxicity of halocarbons. In order to determine the dose received in target organs and other tissues, serial samples of brain, liver, kidney, lung, heart, skeletal muscle, and adipose tissue have been taken and analyzed for halocarbon content after administration of PCE, TET, and TRI in rats, PCE and TET in dogs, and TRI in mice. For neurobehavioral studies, an operant testing system has been employed for monitoring the central nervous system effects of halocarbons. Neurobehavioral studies have been conducted following oral and inhalation exposure to PCE, and from inhalation exposure to TRI in rats. DTIC

(Contract DAMD17-93-J-3027)
(AD-A285364) Avail: CASI HC A02/MF A01

Blood loss resulting in decreased organ perfusion and subsequent ischemic injury of cardiac and skeletal muscle presents a significant problem for the soldier in combat. Recent findings have indicated that different forms of noxious stress including exposure to increased temperature, noxious chemical agents, and ischemia lead to increased expression of heat shock proteins (HSP) which have a protective effect against injury induced by noxious stimuli. We will determine in this proposal if a rat skeletal muscle derived permanent cell line, L6 cells, expressing increased amounts of HSP70 will show protection against damaged induced by simulated ischemia. To generate L6 cells which permanently overexpress the inducible HSP70 proteins, cells will be transfected with a neomycin resistance gene and the inducible HSP70 gene. Stable lines will be selected by growing L6 cells in the presence of neomycin. Cells which have the neomycin resistance gene and the HSP70 gene incorporated into their DNA will survive. Such stably transfected L6 cell lines will then be exposed to simulated ischemia consisting of hypoxia, absence of glucose, low tonicity, and resultant ischemic damage will be determined by quantitating cell viability measured in colony formation assays, the inhibition of protein synthesis and the release of cytoplasmic enzymes like creatine kinase. These studies will determine if inducible HSP70 exerts a protective effect against ischemia mediated muscle injury. Demonstrating a protective effect of HSP70 protein will make it a useful agent to reduce ischemic muscle damage in soldiers exposed to muscle injury in combat. DTIC

ENHANCEMENT OF CELL MEDIATED IMMUNITY THROUGH NON-SPECIFIC IMMUNOSTIMULATION WITH LIPOSOME ENCAPSULATED GAMMA-INTERFERON
J. P. Wong, B. Kournikakis, E. G. Saravolac, and L. C. Gorton Apr. 1994 24 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A279667; DRES-SR-584) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The ability of liposome-encapsulated gamma interferon (LIP-gamma IFN) to stimulate mouse cell-mediated immunity was assessed both in vivo and in vitro. The enhancement of the cell-mediated immune response was demonstrated in vitro by a chemiluminescent assay which measured the phagocytic activity of peritoneal macrophages. Peritoneal macrophages harvested from mice treated with gamma interferon (gamma IFN) or muramyldipeptide showed significant increases in both macrophage yield as well as in ability to phagocytize zymosan particles. However, when treated with gamma IFN encapsulated within liposomes both macrophage yield and phagocytic activity further increased by at least 100% over unencapsulated gamma IFN. Using the in vivo influenza mouse protection model, intranasally administered LIP-gamma IFN resulted in a 70% survival rate to mice challenged intranasally with 10 LD50 doses of influenza A/PR/8 virus compared with a 20% survival rate with free gamma IFN. Together these results suggest that liposome encapsulation increases gamma IFN efficacy in providing non-specific stimulation of the cell-mediated immune system. DTIC

EFFECTS OF BIFOCAL AND PROGRESSIVE-ADDITION CORRECTIVE LENSES ON AVIATOR TARGET-DETECTION PERFORMANCE Interim Report, 1 Oct 1992 - 30 Sep. 1993
M. D. Reddix, A. S. Markovits, P. D. Collyer, and S. R. OConnell Dec. 1993 17 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(NR Proj. M00-96)
(AD-A279698; NAMRL-1390) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The objective of this project was to determine if the type of presbyopic correction worn by aviators, conventional bifocal versus progressive-addition lenses (PAL's), differentially affects aviator visual search performance. Experienced aviators with tactical fighter aircraft experience searched for high-contrast targets under simulated dawn/dust lighting conditions while wearing either a standard bifocal (ST-25) or PAL spectacle correction. Latency of locating high-contrast targets under these viewing conditions was affected differentially by the type of presbyopic correction used.

Specifically, compared to a standard bifocal (ST-25), a PAL correction (Varilux Infinity) significantly lowered the time needed to locate static targets at a cockpit-instrument viewing distance (83 cm). Accuracy of target-location responses was not affected by the type of correction used. In addition, 7 months post experiment, 7 of the 12 participants (58%) indicated that they used their PAL correction exclusively when flying the T-39 Sabre Liner. Three subjects (25%) used their PAL correction intermittently (primarily at night) when flying, and two subjects preferred not to use the PAL's. These results suggest that: (1) relative to bifocals, speed of responding to static targets at intermediate viewing distances may be improved by wearing PALS; and (2) subjects were able to adapt to PAL lenses quickly in a laboratory setting, using them later in a functional aviation environment.

ACOUSTIC CALIBRATION APPARATUS FOR CALIBRATING PLETHYSMOGRAPHIC ACOUSTIC PRESSURE SENSORS Patent Application
Allan J. Zuckerwar, inventor (to NASA) and David C. Davis, inventor (to NASA) 11 May 1994 14 p
(NASA-Case-LAR-14977-1; NAS 1.71:LAR-14977-1;
US-Patent-Appl-SN-243665) Avail: CASI HC A03/MF A01

An apparatus for calibrating an acoustic sensor is described. The apparatus includes a transmission material having an acoustic impedance approximately matching the acoustic impedance of the actual acoustic medium existing when the acoustic sensor is applied in actual in-service conditions. An elastic container holds the transmission material. A first sensor is coupled to the container at a first location on the container and a second sensor coupled to the container at a second location on the container, the second location being different from the first location. A sound producing device is coupled to the container and transmits acoustic signals inside the container.

COMPUTER BASED ANALYSIS AND SYNTHESIS OF RETINAL FUNCTION Annual Report, 1 Feb. 1992 - 31 Jan. 1993
Frank S. Werblin 27 Jan. 1994 16 p
(Grant AF-AFOSR-0196-91)
(AD-A286084; AFOSR-94-0676TR) Avail: CASI HC A03/MF A01

A fully functional, real time dynamic model of retinal activity has been implemented on a high speed digital image processor. The model uses a complete set of physiciological parameters derived from electrophysiological studies of synaptic transmission, cell coupling, voltage-gated currents and visual function in the retina of the tiger salamander. This model displays the patterns of activity generated at each sheet of retinal cells in real time, in response to any arbitrary stimulus pattern. Recent work measures both the patterns of activity and the activity of single units within the living retina itself at the level of the photoreceptors, horizontal and bipolar cells. These measurements are then correlated with the patterns generated by the model to verify the accuracy of the parameters and functions used to model the retina. For the most part, the correlations are quite close, suggesting that the parameters we have used and the functional relations between elements we have selected are adequate. A recording system using an array of electrodes to constructed and will be used during the next year to record patterns of activity. These patterns will then be compared with those generated by the model.

Although the consequences of excessive light exposure to the eye have been known since ancient times, the actual mechanisms of light damage in biological tissue have only been systematically investigated in this century. The response of tissue to laser or incoherent light depends on the power density, peak power, and wavelength of irradiating energy. At least three light damage mechanisms have been identified. Photochemical damage is produced by short wavelength light (typically less than 550 nm) of long exposure duration, low peak power, and relatively low to moderate power density. Because tissue heating is minimal under these conditions, damage is thought to occur as result of excitation of target molecules to excited triplet states, some of which damage tissues directly through proton or electron transfers. The light-activated molecules may also cause damage indirectly by reacting with molecular oxygen to produce oxygen radicals, which are known agents of cellular damage. Thermal damage may be produced by light exposures of any wavelength capable of being absorbed by the tissue, given a sufficiently high power density and/or moderate to high peak power. Heating occurs by direct absorption of photons by a tissue chromophore which converts this photic energy into increased vibrational modes. The target chromophore, as well as surrounding structures depending on local heat conductivity, may then undergo thermal denaturation. At very high peak power, however, the strength of E-, or electrical, field of the absorbed electromagnetic wave may exceed the dielectric properties of the absorbing tissue, causing optical breakdown, ionization, plasma formation, and other phenomena associated with nonlinear (photodisruptive) damage mechanisms.

EVALUATION OF DRIED STORAGE OF PLATELETS FOR TRANSFUSION: PHYSIOLOGIC INTEGRITY AND HEMOSTATIC FUNCTIONALITY Triannual Report No. 2, 1 Jun. - 30 Sep. 1994
Arthur P. Bode 27 Oct. 1994 7 p
(Contract N00014-92-J-1244)
(AD-A286078) Avail: CASI HC A02/MF A01

The current long term dried storage study was terminated at 8 months in this reporting period. The preparations under study were (1) 0.02% permanganate in 5% BSA, and (2) 1.8% paraformaldehyde in 500 mM Trehalose stored desiccated at RT, 4 C, or at -70 C. Neither prep maintained good morphology at any temperature, and there was minimal ristocetin aggregation or hypotonic shock response remaining. At this 8 month workup, yield of intact platelets upon reconstitution was dependent on the storage conditions: 27-29% for RT, 41-46% for 4 C, 68-78% for -70 C. Our conclusion from this study reinforces what we learned from earlier storage studies: that there is significant deterioration of product at RT. In this particular experiment we found that permanganate-treated platelets, or para-platelets dried in Trehalose are as susceptible to loss of integrity over time as other preps. Our platelet handling techniques have improved since these studies were initiated. Another set of new preparations will be set aside for long-term storage in the next reporting period.

PRECLINICAL INVESTIGATION OF LYOPHILIZED PLATELET PREPARATIONS Annual Report No. 1, 1 Sep. - 31 Aug. 1994
Arthur P. Bode 31 Oct. 1994 9 p
(Contract N00014-93-J-1034)
(AD-A286079) Avail: CASI HC A02/MF A01

We have previously shown that lyophilized platelets (L-Plt) retain properties of adhesion and activatability in the Baumgartner perfusion chamber (Trans 33:72S, 1993). Now we have analyzed L-Plt in two systems directly testing hemostatic function. Study Design: One is a prototype device simulating the Ivy bleeding time in vitro (IVBT) and collagen-induced thrombus formation (CITF) in recalcified whole blood (Xylum Clot Signature Analyzer: CSA); the other is an in vivo bleeding time in dogs on full clinical heart-lung bypass before and after infusion of L-Plt. Results: On the CSA, L-Plt gave an average (n=4) IVBT of 1 min 58 sec and a CITF of 73% versus 2 min 14 sec and 88% respectively for fresh platelets. Expired platelet concentrates gave indeterminate results because aggregates clogged the lines. IVBT greater than 6 min and CITF less than 25% is typical of vWD patients. In two canine heart-lung bypass studies, the in vivo bleeding time improved from greater than 15 min to 5-7 min after infusion of abolus of 2-3 x 1011 L-Plt. The corrected count increments were (1) 88% and (2) 47% based on estimated circulatory volume. Conclusions: These results demonstrate the hemostatic activity of L-Plt and their potential value in transfusion medicine.

Devices that collect 3D data from human beings are nowadays very common diagnostic tools in big hospitals. Magnetic Resonance Imaging (MRI) and Computerized Tomography Imaging (CT) produce very detailed anatomical information of a human being. Those methods collect a series of 2D images. When slices are put one on the other, a 3D image can be created. The finest resolution of modern imaging devices is about one millimeter (MRI and CT techniques). Usually the interslice distance is longer than the pixel distance in the slices. The resolution limits the size of the collected digital images. This problem can be removed by enlarging the image. Because data is in digital form we have to calculate more voxels (3D pixel) between the original points. This is called interpolation. NTIS

Fifteen men were exposed to 6,683 PPM C18O for 3.1 - 6.6 min. Venous and arterial blood sample were drawn at one-min intervals beginning at the start of exposure and finishing 10 min later. Simultaneously, V(sub A) was calculated from the measured values of V(sub E) and deadspace. V(sub E) was measured by integrating digitized continuous measures of inhaled and exhaled gas. All parameters of the nonlinear Coburn-Forster-Kane equation (CFKE) were measured on the individual subject except for the Haldane affinity ratio. Predictions of venous blood COHb in samples collected ca. two min after cessation of exposure were accurately predicted by the CFKE. Both venous and arterial COHb were inaccurately predicted during COHb formation, however. Venous levels were overpredicted during formation due to delayed appearance of COHb. Individual subjects differed markedly in the delay of COHb appearance in venous blood. Arterial COHB was consistently underestimated either by the CFKE or by predictions based on venous blood samples. Thus, exposure of such organs as brain or heart to COHb can be higher than expected from previous knowledge when transient CO exposure is involved. An explanation is suggested for the observed differences between arterial and venous COHb on the basis of the regional circulation of the forearm, where both samples were taken. Because regional circulation patterns are known to vary with physical training, the differences in physical training between subjects may account for the observed variation. An expanded model was derived from the Coburn-Forster-Kane equation that reflects the above hypothesis. Most of the parameter values for the expanded model were measured on individual subjects. Literature values were used for other parameters. DTIC

Segmentation and stereo matching are the two essential steps in stereo vision. The thesis deals with their integration and can be roughly divided into three parts: segmentation, local matching, and global matching. It uses the Minimal Description Length (MDL) principle to encode image intensities and introduce a robust method to estimate the image intensity from raw image data. It also develops an approach for shape constrained image segmentation which integrates region growing and region boundary fitting. The thesis then deals with local matching in which only the local attributes of image regions are considered. It contains a detailed discussion on the integration of segmentation and stereo matching. The introduction of feedback enables the proposed system to send back the matching result to a resegmentation stage to improve the segmentation result and consequently the matching result. It then moves on to discuss global matching whose goal is to get unique matches, taking care of topological and other matching constraints. It formulates the global matching as a relaxation problem. MICROCLIMATE COOLING EFFECT ON PERCEIVED EXERTION IN FOUR HEAT/EXERCISE SCENARIOS Interim Report
Ralph G. Burr, Daniel W. Trone, Robert S. Pozos, Elmer J. Labranch, and Christopher S. Parrish May 1994 16 p
(NR Proj. MM3-3-P-30)
(AD-A285549; NHRC-94-7) Avail: CASI HC A03/MF A01

Operation Desert Storm demonstrated a need for individual microclimate cooling during strenuous activity. Evaluation of a cooling system should not only consider physiological functions but subjective measures of comfort, such as ratings of perceived exertion (RPE). The objectives of this study were evaluate a cooling suit's effect on: (1) subjective RPE, (2) heart rate (HR), and (3) the magnitude of the correlation between RPE and HR. Thirty-one U.S. Marine Corps subjects, wearing chemical defense ensemble, were tested in four separate scenarios of heat/exercise combinations during both cooling suit and control sessions. Results of repeated measures multivariate analysis of variance showed that RPE was significantly lowered by wearing a cooling suit during only the most strenuous of the four scenarios. A decrease in the magnitude of the correlation between RPE and HR during all four cooling suit sessions indicated that a microclimate cooling suit interferred with perception of exertion. DTIC

The lack of visual information and cues in night vision images has produced a history of in-flight mishaps where night vision devices (NVDS) were used as the primary source of sight. In an effort to produce improved night vision images and thereby reduce in-flight mishaps, a video enhancement technique, the sharper image, was developed to enhance, filter, and study images generated by NVDS. The sharper image technique enhances night vision images by filtering or amplifying the spatial frequencies that are distorted by NVDS. In this report, we describe the necessary methodology and procedures to enhance, filter, or process any visual image. We also discuss other computational image software and review the advantages and disadvantages of each. DTIC

Visual contrast-onset-evoked magnetic fields were measured with a 122-channel magnetometer covering the whole scalp. To facilitate the estimation of the spatial and temporal distribution of cortical generators, the responses were broken into two parts according to the dependence on the visual-field location of the stimulus. Minimum-norm estimates suggested that the generators for the part that was independent of the stimulus position were located in several occipital and extra-occipital regions, whereas the visual-field-dependent generators were predominantly in the occipital cortex. Our results support the view that information about the retinal image, even during passive viewing, is routed to several cortical areas. NTIS

This study sought to identify the cellular events that occur after a blood shift to the upper part of the body stimulates the release of Atrial Natriuretic Factor (ANF). Eight male rats were placed in antiorthostatic position (-30 deg) to produce right atrial distention for periods ranging from 1/4 hour to 6 hours. Samples of the right atrial appendage were then analyzed. Results showed a significant increase in immunoreactivity inside the granules after 1/2 hour of stimulation. The number of granules rose, but the size of the vesicles did not change. Plasma ANF concentration increased significantly after 1 hour of stimulation. This result indicates that in less than 1/2 hour, heart myocytes can modify their storage of ANF, and that the concentration of the hormone inside secretion vesicles increases at an early stage. The delay between this event and the hormone's peak plasma level is probably linked to the vesicles' release process. Further studies are need to describe the mechanism involved. NTIS

In the period 1969-1986, this project was directed to the evolution of target-specific labeled chemicals useful for nuclear medical imaging, especially radioactive indicators suited to tracing adrenal functions and localizing tumors in the neuroendocrine system. Since 1986, this project research has focused on the chemistry of positron emission tomography (PET) ligands. This project has involved the evaluation of methods for radiochemical syntheses with fluorine-18, as well as the development and preliminary evaluation of new radiopharmaceuticals for positron emission tomography. In the radiochemistry area, the ability to predict fluorine-18 labeling yields for aromatic substitution reactions through the use of carbon-13 NMR analysis was studied. Radiochemical yields can be predicted for some structurally analogous aromatic compounds, but this correlation could not be generally applied to aromatic substrates for this reaction, particularly with changes in ring substituents or leaving groups. Importantly, certain aryl ring substituents, particularly methyl groups, appeared to have a negative effect on fluorination reactions. These observations are important in the future design of syntheses of complicated organic radiopharmaceuticals. In the radiopharmaceutical area, this project has supported the development of a new class of radiopharmaceuticals based on the monoamine vesicular uptake systems. The new radioligands, based on the tetrabenazine structure, offer a new approach to the quantification of monoaminergic neurons in the brain. Preliminary primate imaging studies support further development of these radioligands for PET studies in humans. If successful, such radiopharmaceuticals will find application in studies of the causes and treatment of neurodegenerative disorders such as Parkinson's disease. DOE

Three tasks were conducted under the acute radiation sickness amelioration analysis in support of the Defense Nuclear Agency (DNA) and

NATO Army Armaments Group (NAAG) Project Group 29 (PG-29) on drugs for the prevention of radiation-induced nausea and vomiting: (1) documents were collected and entered into a data base, (2) data reviews and analyses were performed, and (3) PG-29 and Triservice meetings involving anti-emetic drug development were supported and documented. Approximately 2000 documents were collected, with 1424 complete bibliographic citations entered into a WordPerfect 5.1 data base. Eight reviews and analyses addressing different aspects of the safety and efficacy of the candidate anti-emetic drugs ondansetron and granistron were prepared. Support was provided for seven international PG-29 meetings and two U.S. Triservice meetings in which the efforts of PG-29 were discussed. These tasks have enabled the DNA and PG-29 to make good progress toward the goal of recommending a serotonin type-3 (5-HT3) receptor antagonist anti-emetic drug for use in military personnel. DTIC

Current Air Force policy restricts pilots, with even minimal coronary artery disease (CAD), from flying high-performance aircraft. Liberalization of this policy is being considered, but additional data are needed for more informed decision. Eleven miniature swine (MS) were placed on a high cholesterol/high fat diet for 1 year. Five additional MS were maintained on a standard control swine diet (no cholesterol) over the same time. A vascular access port (VAP) was surgically placed into the superior vena cava. The 16 unanesthetized MS were +Gz-stressed one or two times each, using an alternating 4-8 +Gz simulated aerial combat maneuver (SACM) with 10 sec at each +Gz level. The MS were protected with an abdominal bladder anti-G suit. At the end of the SACM, Tc-99m was infused into the VAP and the MS were scanned for myocardial perfusion approximately 1 h later. Three MS died before data collection, one at 6 mos and two at 9 mos. Histopathology showed moderate-to-severe CAD in the three MS. Control and experimental plasma cholesterol levels (mg%) were: total = 77 and 422; ratio = 2.3 and 8.6; LDL = 35 and 353, respectively. Dysrhythmias and T-wave alterations during +Gz were seen equally in both the control and experimental MS. However, ST-T segment changes during +Gz were observed in all of the cholesterol MS, but not in the control MS. DTIC

THERMAL RESISTANCE OF THE CHEEK IN COLD AIR
R. J. Osczevski Sep. 1994 9 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A286257; DCIEM-94-47) Avail: CASI HC A02

Some experiments were carried out to characterize the thermal resistance of the tissues of the cheek area. Heat flow and skin temperature in cold air were measured with a heat-flux transducer. The face was cold when the cheek skin temperature was below 15 C and painful when the skin temperature fell below 10 C. Thermal resistance increased as skin temperature fell, reaching a maximum of 0.07 m(exp 2) K/W at a skin temperature between 10 C and 15 C. DTIC

SOLUBILITIES OF NITROGEN AND HELIUM IN WATER AND BLOOD AT 37 C AND PRESSURES OF UP TO 11 ATA Technical Report, 1990 - 1992
J. Thai and G. Albin Jun. 1994 17 p
(Proj. M00-99)
(AD-A286269; NMRI-94-21) Avail: CASI HC A03/MF A01

The solubilities of N2 and He in water and whole blood were measured at 37 C using a barometric method described in an earlier report. Solubilities have been measured successfully in H2O at approximately 2 ATA and approximately 11 ATA. In addition, protocols for measuring solubilities in whole blood have been explored. Measurements in blood have been unsuccessful thus far (i.e., have disagreed with published results), apparently because efforts have failed to eliminate interphase transport of the metabolic gases O2 and CO2 during the experiment. Blood experiments can resume after the experimental assembly has been modified to allow sampling of the gas phase so that its composition can be determined. This information, in conjunction with the pressure measurements that already are made during each experiment, will enable one to eliminate the confounding effect of O2 and CO2 transport. DTIC

SUSTAINING THE HEALTH AND PERFORMANCE OF SOLDIERS/WARFIGHTERS DEPLOYED TO HARSH ENVIRONMENTS Final Technical Note
Beau J. Freund, G. C. Lindsay, and Ross E. Lipton Nov. 1994 27 p
(AD-A286270; USARIEM-TN95-2) Avail: CASI HC A03/MF A01

This report describes the contributions, core competencies, and capabilities of the U.S. Army Research Institute of Environmental Medicine and this institute's commitment to protect, sustain, and enhance the health and performance of soldiers. The institute's mission focuses on two of the four major threats to the warfighter: environmental and occupational. The significance placed upon environmental threats is described in Army FM 100-5, '... U.S. Army forces must be prepared to fight and win on short notice anywhere in the world, from blistering deserts, frigid wastelands, in rain forests, tundra, mountains, jungles and swamps ... ' Environmental threats to the soldier are addressed with militarily relevant discussions of injuries and casualties incurred by military forces operating in harsh environments within the research disciplines of environmental physiology and medicine. Occupational threats are presented in areas of physical capabilities, physical and cognitive performance, and the multi-stressors associated with continuous and sustained operations. The impact of these threats is studied within the research disciplines of occupational physiology and physical performance; occupational medicine; military performance and neuroscience; and military nutrition. The products of this research institute draw heavily upon the knowledge gained by its research staff over the past forty years and by our researchers that have accompanied troops deployed around the world in training, peacekeeping, and combat operations. AGE 60 STUDY. PART 1: BIBLIOGRAPHIC DATABASE Final Report
Oct. 1994 181 p
(Contract DTFA02-90-C-90125)
(AD-A286245; DOT/FAA/AM-RN-94/20-Pt-1) Avail: CASI HC A09/MF A02

As part of their research contract with the FAA to study issues related to the Age 60 Rule for pilot mandatory retirement, Hilton Systems, Inc. in collaboration with Lehigh University faculty and research facilities, compiled this extensive bibliography. Topics included pilot aging, performance, health and physiological factors, as well as other aviation and pilot related topics. Citations were included from a variety of sources including international and military studies. The bibliography was organized in three sections. The

first section presents a bibliographic listing on the above topics. The second section provides a listing of publications by authors active in related fields. Finally, the third section provides citations from the driving literature.

AGE 60 STUDY. PART 2: AIRLINE PILOT AGE AND PERFORMANCE. A REVIEW OF THE SCIENTIFIC LITERATURE Final Report
Diane T. Hyland, Edwin J. Kay, Jim D. Deimler, and Ernest B. Gurman Oct. 1994 139 p
(Contract DTFA02-90-C-90125)
(AD-A286246; RN-8025-1A-Pt-2; DOT/FAA/AM-94/21-Pt-2) Avail: CASI HC A07/MF A02

This review of the literature establishes the scientific foundation for subsequent studies on the Age 60 Rule research conducted under a contract with Hilton Systems, Inc. The scientific literature relevant to the separate scientific approaches required by the contract is reviewed. The document first provides a review of the Age 60 Rule, as well as theoretical and methodological considerations critical to the study of aging and the assessment of individual pilot performance. A proposed model is presented to form a framework for the research. Pilot behaviors affected by aging and/or experience are reviewed. Specific performance assessment batteries are reviewed in detail in Appendix A. Issues related to measuring complex pilot performance are discussed. Recommendations and criteria for developing a performance methodology are presented. The second part of the literature review provides a discussion of the issues related to the analysis of existing data to assess the relationship between pilot age, experience, and accident rates. This section provides a critical review of existing analyses and presents recommendations for an improved analytical methodology.

OPTICAL RADIATION: HEALTH BASED EXPOSURE LIMITS FOR ELECTROMAGNETIC RADIATION IN THE WAVELENGTH RANGE FROM 100 NANOMETER TO 1 MILLIMETER [OPTISCHE STRALING: GEZONDHEIDSKUNDIGE ADVIESWAARDEN VOOR BLOOTSTELLING AAN ELEKTROMAGNETISCHE STRALING MET GOLFLENGTEN TUSSEN 100 NANOMETER EN 1 MILLIMETER]
29 Jun. 1993 134 p In DUTCH
(PB95-132767) Avail: Issuing Activity (National Technical Information Service (NTIS))

Optical radiation includes infrared radiation, light and ultraviolet radiation. It is a form of electromagnetic radiation with wavelengths between 1 millimeter and 100 nanometers. The main source of optical radiation is the sun. Examples of artificial sources of optical radiation are electric radiators, halogen heaters and lamps, light bulbs, gas discharge tubes and various types of lasers. Excessive exposure to optical radiation can damage health. The levels at which this happens and the effects that occur are the subject of this report. Possible health-promoting effects of optical radiation are not considered.

URBAN AIR CARCINOGENS AND THEIR EFFECTS ON HEALTH
John F. Lechner 1994 13 p Presented at the Health and Environment Meeting, Mexico City, Mexico, 20-21 Oct. 1994
(Contract DE-AC04-76EV-01013)
(DE95-002259; CONF-9410236-2) Avail: CASI HC A03/MF A01

Airborne carcinogens may be relevant especially in metropolitan regions with extreme smog as a primary cause of lung cancer. Lung cancer is most common in urban environs and the incidence directly correlates with the size of the city. In addition, several, but not all formal epidemiological studies also suggest a positive correlation between lung cancer incidence and the intensity of air pollution exposure. There is further support for a role of air pollution; as of 1993, 4.4% of all of the bronchogenic adenocarcinoma cancer cases among Mexicans living in industrialized cities are under 40 years of age. It is plausible that chronic inhalation of automobile combustion products, factory emissions, and/or radon is at least partially responsible for the higher incidence of lung cancer exemplified by the never-smoking urban residents. The exceptionally high incidence of lung cancer cases among never-smokers living in highly industrialized Mexican cities offers a unique opportunity to use molecular epidemiology to test whether chronic inhalation of atmospheric pollutants increases the risk for this disease. Overall, the analysis of the genetic alterations in two cancer genes, and possibly the hprt locus should give new insight as to whether the urban never-smokers developed their cancers because of exposure to environmental pollutants.

CURRENT CONCEPTS ON AIRBORNE PARTICLES AND HEALTH
Joe L. Mauderly 1994 15 p Presented at the Health and Environment Meeting, Mexico City, Mexico, 20-21 Oct. 1994
(Contract DE-AC04-76EV-01013)
(DE95-002260; CONF-9410236-1) Avail: CASI HC A03/MF A01

Epidemiological evidence of associations between environmental particulate concentrations and both acute and chronic health effects has grown with numerous recent studies conducted in the US and other countries. An association between short-term changes in particulate levels and acute mortality now seems certain. The association is consistent among studies and coherent among indicators of mortality and morbidity. Effects observed at surprisingly low pollution levels have raised concern for current exposures even in modestly polluted cities. Toxicology did not predict the acute mortality effect, and causal mechanisms are difficult to rationalize. Present data suggest that the fine fraction of particulate pollution is more toxic than larger particles, but the contribution of specific particulate species is poorly understood.

STUDY OF PULSED LASER EFFECTS ON LIVING TISSUES Final Report [ETUDE DES EFFETS LASERS PULSES SUR LES TISSUS VIVANTS]
L. Court, D. Courant, D. Dormont, and B. Abadie 1994 59 p In FRENCH Prepared in cooperation with Direction des Recherches, Etudes et Techniques, Paris, France
(PB95-131330) Avail: Issuing Activity (National Technical Information Service (NTIS))

The object of the research was to study the effects of brief laser pulses emitted in the visible spectrum and the near infrared on living tissues, the eye and cell cultures, and human fibroblasts. Within the limits of their experimental conditions, the authors found that the irradiation of human fibroblasts by a laser beam will not alter the range of oncogenes that are normally expressed, their level of expression, and their regulation according to their growth. Because of technical problems, the study of the Ha-ras oncogene will require a more detailed analysis of the messenger RNA of the irradiated cells.

TRANSFORMATION OF MULTICHANNEL MAGNETOCARDIOGRAPHIC SIGNALS TO STANDARD GRID FORM
J. Numminen, S. Ahlfors, R. J. Ilmoniemi, J. Montonen, and J. Nenonen Apr. 1994 33 p
(PB95-127114; TKK-F-A727) Avail: CASI HC A03/MF A01

Multichannel magnetocardiographic (MCG) recordings with fixed sensor arrays are not directly comparable with single-channel measurements carried out at standard grid locations. In addition, comparison of data obtained with different types of magnetometers is difficult. The authors present a method for transforming multichannel measurements to the standard-grid format. The minimum-norm estimate (MNE) of the source current distribution in the body is calculated, and the desired field components in standard grid points are then computed from the MNE. The authors measured three subjects with both a 24-channel and a single-channel instrument. The signals extrapolated from the multichannel measurements corresponded quite well to the single-channel data registered at the standard grid locations, especially in those grid points that were covered by the 24-channel device. It was also found that the method is relatively tolerant to errors in the location and orientation of the multichannel magnetometer. The basic advantage of the authors extrapolation method is its physiologic nature: the method is based on the mathematical modeling of the source current distribution rather than on direct constraints applied to the magnetic field.

DIFFUSIBLE DRIVING AND COUPLING SIGNALS OF THE BIOLOGICAL CLOCK Final Report, 1 Apr. 1992 - 31 Mar. 1994

Rae Silver 24 Jul. 1994 5 p
(Contract F49620-92-J-0195)
(AD-A285353; AFOSR-94-0591TR) Avail: CASI HC A01/MF A01

The goal of the research has been to determine whether there is evidence of a diffusible coupling signal from the Suprachiasmatic Nucleus. If a diffusible signal is physiologically significant, it has the potential for use as a bioactive agent for exogenous administration. We believe we now have evidence that such a signal exists, and that it can appear in biologically significant amounts in the cerebrospinal fluid. At the present time we are working to complete the most definitive experiments providing such proof. We are also working towards our next goal: to establish the experimental conditions for identifying the diffusible signal. DTIC

MAGNETIC SOURCE IMAGING OF VISUALLY EVOKED AND OSCILLATORY ELECTRICAL ACTIVITY OF THE HUMAN BRAIN Ph.D. Thesis
S. Ahlfors 6 Jun. 1994 148 p See also PB85-201036
(PB95-127205; ISBN-951-22-2150-0) Avail: CASI HC A07/MF A02

The aim of this thesis work was to develop biomagnetic recording and analysis techniques and to apply them to studies of visually-evoked and spontaneous electrical activity in the human brain. The magnetoencephalographic method was applied to studies of the human visual cortex and oscillatory brain activity. Cerebral source currents evoked by simple, passively viewed checkerboard stimuli were found to be distributed over large regions of the cortex, showing complex variations as a function of time. The usefulness of minimum-norm estimates was evident in cases in which a multitude of sources overlap, both when giving a 2D estimate of the primary current distribution and when providing a standard representation of the measured magnetic field. With retinotopically organized stimuli, some of the difficulties inherent in the biomagnetic inverse problem could be overcome. Similar differentiation of the underlying source patterns should be possible in future studies by varying other stimulus properties as well. NTIS

A DATABASE FOR ANALYZING SEQUENTIAL BEHAVIORAL DATA AND THEIR ASSOCIATED COGNITIVE MODELS
Bonnie E. John 15 May 1994 24 p Revised Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A280061; CMU-CS-94-127; CMU-HCII-94-101) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Sequential behavioral data, be it verbal protocols, automatically-recorded keystrokes, or complete videotape protocols, can be analyzed at different levels of detail and from different viewpoints. If raw behavioral data is stored in a powerful database, rather than a simple text file, many domains will allow some automatic interpretation of that data. In addition, the raw data can be compared with traces of an associated computational cognitive model to assess how well the model accounts for the data and, conversely, how much support the behavioral data provides for the components of the model. This report describes a prototype database and user interface, called Trace & Transcription, that is designed to facilitate protocol analysis and cognitive modeling. This research was supported in part by a grant from US West Advanced Technologies Sponsored Research Program. The views and conclusions contained in this document are those of the author and should not be interpreted as representing the official policies, either expressed or implied, of US West. DTIC

TEST RELIABILITY AND EXPERIMENTAL POWER
R. R. Stanny Dec. 1993 15 p
(AD-A279607; NAMRL-SP-93-7) Avail: CASI HC A03/MF A01

The reliability coefficient, rho(sub xx), has long been accepted as an index of the stability, repeatability, and precision of psychological tests. Because rho(sub xx) measures the proportion of the variance in a set of scores attributable to variation among individuals, values of rho(sub xx) are sometimes compared to justify using particular tests in studies of individual differences. Values of rho(sub xx) are also sometimes compared to justify using particular tests in experimental research. The latter practice is usually justified by arguing that larger values of rho(sub xx)) imply greater measurement precision and, therefore, potentially greater sensitivity to experimental treatments. That argument is not generally correct because the individual variation measured by rho(sub xx) is frequently confounded with measurement error in the denominators of significance tests. The effects of this confounding lead to 'paradoxical' situations in which reliability, as measured by rho(sub xx), may be inversely related (or unrelated) to experimental precision, as measured-by the reciprocal of experimental error. Because the power of an experiment increases with precision, as just defined, conditions that invert or negate the relationship between rho(sub xx) and precision also invert or negate the relationship between rho(sub xx) and power. These considerations do not mean that the reliability coefficient is necessarily irrelevant to experimental research. Because experimental designs differ in the degree to which they are influenced by individual variation, a consideration of the value of rho(sub xx)) a specific test yields will sometimes provide information about the best design in which to use that test. ROLE OF WORKING MEMORY LIMITATIONS OF RETRIEVAL Annual Technical Report, May 1993 - May 1994
Randall W. Engle 12 May 1994 10 p
(Contract F49620-93-1-0336)
(AD-A280032; AFOSR-94-0332TR) Avail: CASI HC A02/MF A01

Over the past year, 11 studies have been completed on the role of working memory limitations on storage retrieval of information. One series demonstrated that, if subjects are highly trained and there is no interference among the items being retrieved, working memory limitations play no role in retrieval. However if there is interference among the information being retrieved, individuals low in working memory capacity suffer in retrieval from active memory compared to high working memory individuals. Regardless of interference condition, however, working memory capacity plays no role in retrieval from inactive or secondary memory. A second series of studies demonstrated that the phonological similarity effect, one of the primary sources of evidence for the articulatory loop, is not found if the words in the lists to be recalled are chosen from an unlimited set and presented silently. This casts doubt on the generality of this code, particularly for silent reading. DTIC

THE SPATIOTEMPORAL CHARACTERISTICS OF VISUAL MOTION PRIMING Final Report, Aug. 1991 - Aug. 1992
Alan R. Pinkus Jul. 1994 100 p
(AF Proj. 6893)
(AD-A284782; AL/CF-TR-1994-0084) Avail: CASI HC A05/MF A02

A motion signal that is produced from a sine-wave luminance grating which has undergone an abrupt 90-degree phase shift (frames 1 to 2) can serve as a priming signal that disambiguates motion of a second, 180-degree (counterphase) shift (frames 2 to 3). Four experiments investigated the spatiotemporal characteristics of this phenomenon which is termed visual motion priming (VMP). Experiment 1 varied the phase-shift magnitude of the priming signal from 22.5 through 157.5 degrees. This resulted in an inverted U-shaped half-sine function that peaked at 90 degrees with 93.5% priming. Experiment 2 varied frame 2 duration (192, 384, 768, and 1530 ms), spatial frequency (0.7, 1.4, and 2.8 cycles/degree), and used 19 or 48% contrast for the 3 frames. VMP decreased monotonically from about 94% at 192 ms to near 50% (chance level) at 768 and 1530 ms. Duration and spatial frequency were significant, but contrast had no systematic effect. Experiment 3 varied the ratio of frame 1 contrast (4, 6, 13, 19, 30, 48%) relative to frames 2 and 3, where both of the latter two frames had either 19 or 48% contrast. Several effects were observed. When the ratio of the contrasts between frames 1 and 2 was largest (4-48-48% contrast for frames 1-2-3, respectively), VMP was lowest at 82%. A smaller initial ratio, but a lower overall contrast level (4-19-19% contrast), resulted in a higher VMP of 91.5%. As the priming contrast ratios decreased to 1:4 or less, irrespective of overall contrast level, VMP quickly asymptoted. DTIC

A 3D STEREO DATA VISUALIZATION AND REPRESENTATION M.S. Thesis
Kai-Heng Wang Sep. 1994 110 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A284788; AFIT/GCE/ENG/94S-01) Avail: CASI HC A06

This thesis investigates a technique for improving the perception and visualization of three dimensional information. This improvement will eventually give physicians the ability to both visualize and understand biomedical image data. Raw data is used to generate a stereo image pair. The raw data must be put in run length encoding (RLE) format and then converted to a stereo pair. Once the stereo pair is generated, they must be displayed on the Silicon Graphics ONYX workstation in stereo mode. This research uses 3D images of planets and satellites. The display information is transmitted across cable and is projected onto a spherical mirror, a real 3D stereo image can be observed. Biomedical data of interest to this research are slices of a volume of tissue. To convert the slice information into volume data a representation that allows meaningful interpolation between the slices for stereo image pair generation is necessary. A second thrust of this thesis is to investigate neural networks and Kriging algorithm for potential use in interpolation of the biomedical volume data. DTIC

N95-20314 California Univ., Santa Cruz, CA. Dept. of Psychology and Psychobiology.
SPACE CONSTANCY ON VIDEO DISPLAY TERMINALS Final Report, 1 Jan. - 31 Dec. 1991
Bruce Bridgeman 28 Apr. 1994 24 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0095-90; AF Proj. 2313)
(AD-A280015; AFOSR-94-0331TR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Flicker of video display terminals (VDT's) has several consequences for visual function: space perception is distorted, and reading is slowed. We first tested the hypothesis that the flicker of VDT's interferes with visual space constancy, the perception that the world remains in the same place despite eye movements. Space constancy was probed by moving targets during eye movements, and noting a difference in movement threshold that depended upon whether a target jumped in the same direction as the eye or the opposite direction. Flicker rates up to 260 Hz distorted perception in a direction that implies breakdown of space constancy. Another experiment investigated the roles of color and luminance mechanisms in space constancy. The conclusion was that perception is actively suppressed during eye movements. The suppression depends on channels in the visual system that are insensitive to chromatic differences. Reading with 60 Hz flicker was 3.05% slower than with 500 Hz flicker. The result is consistent with a hypothesis that under flicker the eye 'parks' following an eye movement, until a new sample of text appears. Processing then proceeds in the usual way. The results allow quantitative predictions of reading speed at an flicker rate. DTIC

DEVELOPMENT AND ENHANCEMENT OF A MODEL OF PERFORMANCE AND DECISION MAKING UNDER STRESS IN A REAL LIFE SETTING Annual Report, 1 Oct. 1993 - 30 Sep. 1994
Colin F. Mackenzie Sep. 1994 7 p
(Contract N00014-91-J-1540)
(AD-A285945) Avail: CASI HC A02/MF A01

We have concentrated our analysis on 50 of over 100 videotapes acquired of trauma patient resuscitation and anesthesia. The management of the airway (tracheal intubation) in these 50 videotapes was classified into three types of situations: (1) emergency (less than 10 min after patient admission); (2) semi-emergency (less than 30 min after patient admission); and elective. Such a classification allowed us to contrast the impact of stress on performance and team activity. As a result of this analysis, several factors have been illustrated that may have contributed to untowarded incidents, identified the impact of task complexity on team coordination patterns, and investigated the linkage between task performance and communication failures. A COMPARISON OF DECISION MAKING BEHAVIOUR IN A STATIC AND A DYNAMIC TASK ENVIRONMENT AS A FUNCTION OF TIME PRESSURE Interim Report [EEN VERGELIJKING VAN BESLISGEDRAG IN EEN STATISCHE EN EEN DYNAMISCHE TAAKOMGEVING ALS FUNCTIE VAN TIJDSDRUK]
J. H. Kerstholt and A. R. Pieters 20 May 1994 25 p
(AD-A285389; TNO-TM-1994-B-10; TDCK-94-0052) Avail: CASI HC A03/MF A01

Decision making research shows an increasing interest for time-dependent decisions. In contrast with decision making in static tasks, where, based on the available information, only one decision needs to be made, dynamic environments offer the possibility to adjust incorrect decisions through continuous feedback on the overall system state. It is therefore to be expected that the outcome performance will be better in a dynamic than in a static task environment. Previous research indicates that decision makers adjust their mental activities to the demands of the decision environment. Since dynamic environments offer the possibility for corrective actions, in contrast to static environments, it was predicted that cognitive performance would be worse in a dynamic task, on the assumption that people want to make accurate decisions with minimal mental effort. Furthermore, as it was assumed that the advantages of dynamic environments would reduce as time pressure increased, we predicted that both outcomes and cognitive performance would be more equal in dynamic and static tasks as time pressure increased. In an experiment two versions of a similar diagnosis task were used: a static and a dynamic one. In the dynamic task version subjects decided in real time, and they saw a graph on a computer screen indicating the state of the system. In the static task version, subjects did not get this information and their task was to make one diagnosis per trial. DTIC

SIGNAL- AND LISTENER- BASED FACTORS IN COMPLEX AUDITORY PATTERN PERCEPTION Final Technical Report, 15 Sep. 1991 - 14 Aug. 1994
Arthur G. Samuel 23 Sep. 1994 13 p
(Grant AF-AFOSR-0378-91)
(AD-A285636; AFOSR-94-0644TR) Avail: CASI HC A03/MF A01

The research project was designed to delineate principles that underlie the perception of complex auditory patterns. During the granting period, nine lines of research were conducted that investigated various aspects of complex auditory perception. These research efforts largely focussed on perception of speech sounds, and provided important information about three aspects of perception. Several of the projects clarified the role that the listener's knowledge of English words can play in decoding speech. Additional studies examined how lower-level representations (spectral patterns, high-frequency sublexical patterns) are processed. Across a number of the research efforts, attentional effects were investigated, to determine how they modulate other processing. Collectively, the research effort made significant progress in clarifying how human listeners decode very complex sounds. DTIC

PERCEPTION AND CONTROL OF LOCOMOTION Annual Technical Report, 1 Sep. 1993 - 31 Aug. 1994
John M. Flach 30 Sep. 1994 12 p
(Contract F49620-93-1-0560)
(AD-A285605; WSU/ATR/662480; AFOSR-94-0648TR) Avail: CASI HC A03/MF A01

This report describes an empirical study to evaluate the ability to track a constant altitude as a function of the structure in optical flow (Manipulated using types of ground texture - splay, depression, dot, and block and the rate of forward motion - global optical flow (GOF) rate). Subjects were asked to track a constant altitude (25 ft) in the face of disturbances to the vertical, lateral, and fore-aft axes. The critical independent variables were texture type and GOF rate. Texture type was manipulated within subjects and GOF rate was manipulated between subjects. Dependent variables included RMS altitude error and correlated control power. The results showed a crossover interaction. For both dependent measures, performance at 0 GOF rate was best with depression angle and poorest with splay angle. The reverse was true at a GOF rate of 3 eyeheights/s. The results are consistent with the hypothesis, suggested by Flach et al. (1992), that the ability to pick-up information about altitude from optic flow depends on the amount of optical flow activity specific to altitude (signal) relative to the flow activity arising from other factors (e.g., motion in the fore-aft and lateral axes) (noise). The optical flow that results from forward motion (GOF rate) is visible in the depression, dot and block textures. This 'noise' makes it more difficult to differentiate the optical activity specific to changes in altitude. With splay texture, there is no change in the flow as a result of forward motion. Therefore, performance with splay texture is independent of GOF rate. DTIC

FACTORS THAT DETERMINE VISUAL ACUITY THROUGH NIGHT VISION GOGGLES FOR EMMETROPES
John C. Kotulak and Stephen E. Morse Apr. 1994 30 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A279339; USAARL-94-16) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Many factors which could affect visual acuity (VA) with night vision goggles (NVG's) already have been studied, e.g., night sky condition and target contrast (Levine and Rash, 1989a and 1989b; Wiley, 1989; Kotulak and Rash, 1992), NVG generation (Miller et al., 1984; Kotulak and Rash, 1992), nuclear flashblindness protection (Levine and Rash, 1989a and 1989b), chemical protective masks (Miller et al., 1989; Donohue-Perry, Riegler, and Hausman, 1990), signal-to-noise ratio (Riegler et al., 1991), interpupillary distance misadjustment (King and morse, 1992), and instrument myopia (Kotulak and Morse, 1992, 1994a, and 1994b; Kotulak, Morse, and Wiley, 1993). Another factor which could influence NVG VA is decreased unaided VA, i.e., VA without NVG's; however, relatively little is known about it. DTIC

MAC/FAC: A MODEL OF SIMILARITY-BASED RETRIEVAL Technical Report, 1 Sep. 1989 - 31 Oct. 1992
Kenneth D. Forbus, Dedre Gentner, and Keith Law Oct. 1994 67 p
(Contract N00014-89-J-1272)
(AD-A286291; TR-59) Avail: CASI HC A04/MF A01

We present a model of similarity-based retrieval that attempts to capture these seemingly contradictory psychological phenomena: (1) structural commonalities are weighed more heavily than surface commonalities in soundness or similarity judgments (when both members are present); (2) superficial similarity is more important in retrieval from long-term memory than is structural similarity; and yet (3) purely structural (analogical) remindings are sometimes experienced. Our model, called MAC/FAC (for many are called but few are chosen) consists of two stages. The first stage (MAC) uses a computationally cheap, nonstructured matcher to filter candidates from a pool of memory items. We redundantly encode structured representations as content vectors, whose dot product yields an estimate of how well the corresponding structural representations will match. The second stage (FAC) uses SME to compute a true structural match between the probe and output from the first stage. MAC/FAC has been fully implemented and tested on dozens of examples. We show that MAC/FAC is capable of modeling patterns of access found in psychological data, and illustrative via sensitivity analyses that these results exhibit the desired dependence on theoretically important factors. The relationship of MAC/FAC to other models of memory is discussed, along with implications and possible extensions. DTIC

PSYCHOSOCIAL STRESS AND MENTAL HEALTH IN A FORWARD-DEPLOYED MILITARY COMMUNITY
Paul T. Bartone, Mark A. Vaitkus, and Robert C. Williams Jul. 1994 14 p
(AD-A285940; WRAIR-TR-94-0020) Avail: CASI HC A03/MF A01

The impact of perceived stressful experiences on mental health was studied using 1993 survey data from a representative sample (N=5,235) of the Army population in Europe. Regression results show stress in various life areas (personal, job, family) strongly predicts depression. Stress associated with mandated force reductions is also a predictor of depression for soldiers with children and working spouses. This study demonstrates empirically that stress associated with military force reductions is related to negative mental health effects. DTIC

ASSESSING POST TRAUMATIC STRESS DISORDER AND PTSD SYMPTOMATOLOGY IN US ARMY PERSONNEL
Paul T. Bartone, Mark A. Adler, and Mark A. Vaitkus 11 Jun. 1994 17 p
(AD-A285941; WRAIR-TR-94-0019) Avail: CASI HC A03/MF A01

This poster presentation reports on selected findings from a large-scale survey study of U.S. Army Gulf War veterans, showing that combat exposure is related to PTSD 'caseness' for substantial numbers of soldiers. In defining PTSD, the diagnostic algorithm contained in DSMIII-R was followed, using appropriate self-reported symptoms from two scales in the soldier survey. While this PTSD scale was adequate to the purpose, some of the items were less than exact matches to the DSM3-R listed symptoms. For future work, a more precise set to DSMIII-R (and now, DSMIV) based items are needed. A review of relevant studies shows that DSM-based PTSD checklists perform very well compared to other self report measures (e.g., Mississippi Scale) in identifying clinically diagnosed cases, and in terms of sensitivity and specificity. A team of researchers at the US Army Medical Research Unit-Europe has developed a new PTSD checklist and scoring procedures for use in future soldier studies. The scale is presented along with recommendations for its use. DTIC

SPATIO-TEMPORAL MASKING IN HUMAN VISION AND ITS APPLICATION TO IMAGE CODING Annual Technical Report
Stanley Klein and D. A. Silverstein Aug. 1994 3 p
(Contract F49620-92-J-0359)
(AD-A284949; AFOSR-94-0555TR) Avail: CASI HC A01/MF A01

Before an image is stored or transmitted, we have access to the original and the distorted versions. The enhanced codec is compared to the original block by block to determine which blocks have been improved by the enhancement. These blocks are then flagged for post-processing in a way that is compliant with the JPEG standard and adds nothing to the compressed image's bandwidth. The end result is a compressed image that can be decompressed on any standard JPEG decompressor, but that can be enhanced by a sophisticated decompressor. For the comparison of the original and enhanced images, we have been developing a new vision model that is specifically tailored to the detection of errors that occur within or between two JPEG codec blocks. Previous filter models have been restricted from using a large number of filters due to computational constraints which we avoid by focusing the model on a tiny spatial area of 8x16 pixels. Further, features of human vision that have been included in previous models (color, temporal, stereo, etc.) are not needed for this more focused problem. Issues that have not been completely addressed by previous models, such as masking effects, are tractable and the model is more applicable to JPEG compression. DTIC

PERSONAL COMPUTER AND WORKSTATION OPERATING SYSTEMS TUTORIAL M.S. Thesis
Charles E. Frame, Jr. Mar. 1994 154 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A280132) Avail: CASI HC A08

This thesis is a review and analysis of personal computer and workstation operating systems. The emphasis is placed on UNIX, MS DOS, MS Windows and OS/2 operating systems. UNIX is covered under the U.S. Government POSIX standard, which dictates its use when practical. MS DOS is the most used operating system worldwide. OS/2 was developed to combat some of the shortcomings of MS DOS. Each operating system which is discussed has a design philosophy that fulfills specific user's needs. UNIX was designed for many users sharing a computer system. MS DOS, MS Windows and OS/2 are designed as single user computer systems. All of these operating systems are in use at the Naval Postgraduate School. All of the operating systems are discussed with regard to their: history of development, process management, file system, input and output system, user interface, network capabilities, and advantages and disadvantages. UNIX has a section devoted to the POSIX standard and MS DOS has a section devoted to Windows 3.1. Apple Corporation's System 7 is mentioned throughout the text, but is not covered in detail. DTIC

FORCE BASED MOTION CONTROL OF A WALKING MACHINE Ph.D. Thesis
H. Lehtinen 1994 164 p
(PB95-129672; VTT/PUB-179) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

Force control of legs of evolving walking machines is assumed to be essential in natural soft and uneven terrain. The large and varying amount of friction in the leg mechanisms while the body is carried and the practical delays and saturation in the hydraulic system increase the complexity of the process to be controlled. The main contributions in the thesis are as follows. The body forces are transformed to the supporting legs in two phases: sets of minimum forces perpendicular to the resultant body force and forces parallel to the same resultant. This method minimizes the possibility of slippage with walking machines, where the desired body force is often close to vertical due to the weight of the body. A load adaptive performance index (PI) force control method for the hydraulic actuation system of MECANT I consisting of an asymmetric cylinder and a symmetrical valve has been developed. The I term of the controller is changed according to the desired load. A rule based altitude controller and a dead-zone and saturation based attitude controller have been designed. The first tests with force controlled vertical actuators show the usability of the method and fast responses to deviations in body orientation. NTIS

DESIGNING THE ARCHITECTURE OF HIERACHICAL NEURAL NETWORKS MODEL ATTENTION, LEARNING AND GOAL-ORIENTED BEHAVIOR Final Report, 1 Nov. 1988 - 31 Dec. 1993
Allon Guez 31 Dec. 1993 23 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0010-89)
(AD-A279898; AFOSR-94-0329TR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

During this period this grant partially supported 6 researchers, and resulted in over 21 publications. This unusually large activity is largely due to the enthusiasm of the researchers and their institution, Drexel University, which indirectly carried some of the financial burden. Neural or other learning architecture for real world, real time applications, necessarily employ feedback and thus deal with the unavoidable dilemma of identification versus stabilization or tracking. The major finding reported focuses on this tradeoff and how to optimally perform it. For linear time invariant finite dimensional systems they are able to perform on-line closed loop identification and tracking. If in addition the learning and tracking cost functions are quadratic they show these costs may be linearly scalarized without loss of optimality. DTIC

A stress evaluation was conducted in a laboratory test in which the physiological and psychological reactions of soldiers were monitored while they wore either the standard battle dress overgarment (MOPPI) or the full complement of chemical protective clothing with mask (MOPPIV) and worked at low, moderate, or high work loads in simulated desert (hot and dry) or tropic (hot and humid) environments. The psychological instruments indicated greater stress responses for soldiers wearing MOPPIV than wearing MOPPI and for soldiers working at a high work load than working at a low work load. DTIC

HUMAN PERFORMANCE STUDIES FOR CONTROL OF MULTIPLE REMOTE SYSTEMS Final Report
Steven A. Murray Jul. 1994 43 p
(AD-A286623; NCCOSC/RDT/E-TR-1658) Avail: CASI HC A03/MF A01

Many systems involving multiple remote sensors or machines require a single operator to control more than one device simultaneously. Interface design issues for operator support in such systems can be formidable, as the inherent task complexity creates significant opportunities for operator confusion and overload. A study was conducted to examine some of these issues, using a simulated industrial security environment as the applied setting. The operator task was to designate the number and location of intruders in a simulated building, using video information from remote sensor platforms. The experiment manipulated the number of displays which had to be monitored, event rate, image redundancy and sensor platform mobility. Response time increased significantly for increasing numbers of displays, as expected, but also increased independently for event rate image redundancy and for mobile sensors. Results showed that significant performance penalties may be encountered in multiple platform control, and that these penalties accumulate at seemingly low levels of complexity. DTIC

HELICOPTER CREWSEAT CUSHION PROGRAM Final Report
Ricky L. Greth Nov. 1994 73 p
(Contract DAAJ02-92-C-0043)
(AD-A286654; USAATCOM-TR-94-D-11) Avail: CASI HC A04/MF A01

A large proportion of Army helicopter pilots suffer back pain caused by flying. Extended missions required during Desert Shield/Desert Storm emphasized this problem. This pain could have an adverse impact on operational readiness, crew effectiveness, and flight safety. Poor posture during flight has been a contributing factor in pilot lower back pain. This program was performed to develop a seat cushion that improves comfort and reduces the incidence of lower back pain without adversely affecting crashworthiness. A literature survey and fact finding study analyzed the problem as it relates to AH-64 pilots. The knowledge and design, however, should be useful in all helicopters, especially in those with crashworthy stroking seats such as the UH-60 and AH-64 and in the future, the Comanche. Conceptual designs were developed which could help alleviate the problem. A survey of materials identified a few foams which were best suited to satisfy most of the requirements identified. Additional laboratory testing of foams was conducted to better compare the final candidates and aid in determining the optimal thickness and density to be used for the bottom cushion. A fit and function evaluation determined appropriate size and range of adjustment required for each postural/comfort aid (thigh, lumbar, and arm support). Prototype cushions were designed and fabricated and were used in dynamic crash test and in an Army-conducted comfort evaluation. Final design modifications were made prior to fabricating the twelve deliverable cushion assemblies. DTIC

HUMAN FORCE EXERTION IN USER-PRODUCT INTERACTION. BACKGROUNDS FOR DESIGN Ph.D. Thesis
B. J. Daams 26 Apr. 1994 347 p See also AD-A233989
(PB95-132858) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

The objective of this project is to suggest how an 'Atlas of Human Force Exertion' for use by designers should be set up, and to assess how far it can contribute to the design of consumer products. In addition, the objective is also to investigate the relations between the forces measured, and between those forces and anthropometric variables. From the nature of the objectives, the emphasis in this research is on the relation between research, results and design, and not so much on the interpretation of the results. The objective of the Atlas of Human Force Exertion is to provide designers with some information to enable them to improve their products on the aspects of force interaction with the user. Further assessment in how far the atlas can contribute to design is necessary to improve the definition of the ambitions, to adjust the expectations of the designers, and to find out whether it is worthwhile to invest time and money to make one. NAVIGATION SYSTEM IN COMBAT VEHICLE [NAVIGERINGSSTOED I STRIDSFORDON]
U. Hoerberg Apr. 1994 19 p In SWAHILI

(PB95-131629; FOA-A-50023-5.2) Avail: Issuing Activity (National Technical Information Service (NTIS))

This study investigates the possibility to reduce, by means of different kinds of technical support, the workload of tank crew members, and in that way increase the capacity of the tank. Basic studies indicated that navigation and position location burdened the tank commander to such a degree that other important functions suffered. The effect of a navigation system on the tank commander's workload is therefore investigated here. The results indicate that in order to reduce the workload of the commander, a large part of the navigation and transportation functions have to be delegated to the tank driver. The driver's need for technical support is also discussed in the report. NTIS

This is Volume 1 of Interim Technical Report No. 1 for the Crew-Centered Cockpit Design (CCCD) Field Demonstration Program. Volume 1 discusses technical accomplishments and results. Volume 2 contains supplementary material in the form of twelve appendices. The objectives of the CCCD Field Demonstration Program are to upgrade, validate, and transition a new system for cockpit design. The system consists of a crew-centered system design process (CSDP) and a set of computer-aided tools known as the Cockpit Design System (CDS). This report summarizes accomplishments during the period September 1992 through June 1993 that include: development of an improved CSDP; system support and management; design of new tools to manage and trace design progress; conversion and improvements to existing software tools; and restructuring of real-time simulation software. The progress on the first of five field demonstrations, known as the F-16 reconnaissance mission, is described and includes information on planning, crew system analysis tasks, prototyping of design alternatives, and reconfiguration of the real-time simulator. ERGONOMIC EVALUATION OF THE APPLE ADJUSTABLE KEYBOARD

P. Tittiranonda, S. Burastero, M. Shih, and D. Rempel (California Univ., Richmond, CA.) May 1994 4 p Presented at the International Ergonomics Association Workshop, Toronto, Ontario, 15-19 Aug. 1994
(Contract W-7405-eng-48)
(DE95-002393; UCRL-JC-117548; CONF-940876-2) Avail: CASI HC A01/MF A01

This study presents an evaluation of the Apple Adjustable Keyboard based on subjective preference and observed joint angles during typing. Thirty five keyboard users were asked to use the Apple adjustable keyboard for 7-14 days and rate the various characteristics of the keyboard. Our findings suggest that the most preferred opening angles range from 11-20 deg. The mean ulnar deviation on the Apple Adjustable keyboard is 11 deg, compared to 16 deg on the standard keyboard. The mean extension was decreased from 24 deg to 16 deg when using the adjustable keyboard. When asked to subjectively rate the adjustable keyboard in comparison to the standard, the average subject felt that the Apple Adjustable Keyboard was more comfortable and easier to use than the standard flat keyboard. THE ADVANCED TECHNOLOGY CREW STATION: DEVELOPMENT AND VALIDATION OF A WORKLOAD ASSESSMENT TECHNIQUE FOR COCKPIT FUNCTION ALLOCATION Final Report

Floyd Glenn, James Boardway, Robert Wherry, Jr., David Cohen, and Meghan Carmody 30 Jul. 1993 58 p
(Contract N62269-90-D-0110)
(AD-A279544; NAWCADWAR-93073-60) Avail: CASI HC A04/MF A01

The design of a new severely upgraded aircraft cockpit requires many design decisions to be made, at least tentatively, prior to any opportunities for generation of detailed design specifications and experimentation with prototypes. In considering issues of interface design and function allocation, it is important to develop predictions concerning the effects of the various design alternatives on pilot performance. Task network models and workload estimation techniques are typically used jointly to accomplish this goal. The work described here was conducted in order to refine type of analysis and prediction technique as part of the U.S. Navy's Advanced Tactical Cockpit (ATC) Pilot-Vehicle Interface (PVI) Program. EFFECT OF LAGS ON HUMAN PERFORMANCE WITH HEAD-COUPLED SIMULATORS Final Report, 1 Jul. - 30 Nov. 1992

R. H. So and M. J. Griffin Jun. 1993 90 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AF Proj. 7184)
(AD-A279577; ISVR-92/33; AL/CF-TR-1993-0101) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This report reviews factors contributing to the effects of lags in head-coupled systems. A model of head tracking behavior is defined with appropriate feedback loops. The relevant lags and their possible effects on operator performance are defined. Twenty-one head-coupled simulators and operational head-coupled airborne systems are listed and grouped according to their feedback loops. Studies of the effects of lags within individual feedback loops are reviewed. The feedback loops investigated were the head-coupled visual loop, the head-slaved weapon control loop, the manual control loop, the eye-coupled visual loop, and the eye-slaved weapon control loop. The effects of relevant task and simulator variables, such as target velocity and motion cues are also discussed. DTIC

TOP TEN LIST OF USER-HOSTILE INTERFACE DESIGN

D. P. Miller 1994 31 p Presented at the 41st Annual American Vacuum Society Symposium, Denver, CO, 24-28 Oct. 1994
(Contract DE-AC04-94AL-85000)
(DE95-001602; SAND-94-2548C; CONF-941001-2) Avail: CASI HC A03/MF A01

This report describes ten of the most frequent ergonomic problems found in human-computer interfaces (HCI's) associated with complex industrial machines. In contrast with being thought of as 'user friendly,' many of these machines are seen as exhibiting 'user-hostile' attributes by the author. The historical lack of consistent application of ergonomic principles in the HCI's has led to a breed of very sophisticated, complex manufacturing equipment that few people can operate without extensive orientation, training, or experience. This design oversight has produced the need for extensive training programs and help documentation, unnecessary machine downtime, and reduced productivity resulting from operator stress and confusion. Ergonomic considerations affect industrial machines in at least three important areas: (1) the physical package including CRT and keyboard, maintenance access areas, and dedicated hardware selection, layout, and labeling; (2) the software by which the user interacts with the computer that controls the equipment; and (3) the supporting documentation. A METHOD TO DETERMINE THE KINEMATICS OF THE LOWER LIMBS OF A SUBJECT PEDALING A BICYCLE USING ENCODERS AND ACCELEROMETERS M.S. Thesis

Shih-Ching Liu 1 Apr. 1994 68 p Sponsored by NASA and the American Association of Engineering Education
(NASA-CR-197401; NAS 1.26:197401) Avail: CASI HC A04/MF A01

The goal of this research was to determine kinematic parameters of the lower limbs of a subject pedaling a bicycle. An existing measurement system was used as the basis to develop the model to determine position and acceleration of the limbs. The system consists of an ergometer instrumented to provide position of the pedal (foot), accelerometers to be attached to the lower limbs to measure accelerations, a recorder used for filtering, and a computer instrumented with an A/D board and a decoder board. The system is designed to read and record data from accelerometers and encoders. Software has been developed for data collection, analysis and presentation. Based on the measurement system, a two dimensional analytical model has been developed to determine configuration (position, orientation) and kinematics (velocities, accelerations). The model has been implemented in software and verified by simulation. An error analysis to determine the system's accuracy shows that the expected error is well within the specifications of practical applications. When the physical hardware is completed, NASA researchers hope to use the system developed to determine forces exerted by muscles and forces at articulations. This data will be useful in the development of countermeasures to minimize bone loss experienced by astronauts in microgravity conditions. Author

Exposure to high intensity impulse noise produced by modern military weapons is known to be hazardous to hearing. Hearing protection is required; however, there is no generally accepted theoretical way to predict whether protection will be adequate for the highest noise levels. This had led us to empirically determine the safe limits of exposure to impulse noise when hearing protection is used by exposing human volunteers under controlled conditions. Over the past 5 years, a series of studies has been conducted to determine the maximum safe exposure to high intensity freefield impulse noise. An exposure was considered to be safe if it produced only a small temporary threshold shift (TTS less than 25 dB) in a small percentage of the volunteers exposed. Three different impulses were used with A-durations of 0.8, 1.4, and 2.9 ms. Both the level and number of impulses were varied to find the maximum tolerable exposure for combinations of these parameters. The peak sound pressure levels ranged up to 196 dB. The number of impulses was varied from 6 to 100. Approximately 60 volunteers were exposed to each type of impulse, allowing high confidence estimates of the exposures which would produce no significant TTS in 95 percent of the exposed population. The hearing protection used was an ear muff which had been modified to simulate a poor fitting protector. The results of these studies indicated that even with a relatively poor hearing protector, combinations of level and number of impulses which far exceed our currently accepted exposure limits could be tolerated by 95 percent of the volunteers. OCCUPANT REACH AND MOBILITY APPARATUS Patent Application

Gary R. Whitman, inventor (to Navy) and David A. Rose, inventor (to Navy) 12 Apr. 1994 12 p
(AD-D016253; US-Patent-Appl-SN-226517) Avail: CASI HC A03/MF A01

A three-dimensional grid is created by a series of panels arranged in a semi-circle about a seated subject. The panels are configured or otherwise arranged to allow the seated subject full range of reach in all directions. The subject may be seated or standing and is placed a distance from the panels. The panels include a plurality of rods which slideably project through the panels in the direction of the seated subject. To determine reach, the subject reaches toward the rods and pushes them with either hand as far away from him/her as possible. Measurements may then be taken from the end of each rod that has been moved. Similarly situated panels, including visual indicia, may be used to evaluate field of view. DTIC

PERSONAL HYGIENE BODY WIPE Final Report, 1 Oct. 1993 - 30 Sep. 1994

Edmund M. Powers and Mark J. Buller Nov. 1994 71 p
(AD-A286092; Natick/TR-95/002) Avail: CASI HC A04/MF A01

Military doctrine requires a soldier to take a shower at least once every seven days to maintain certain health standards. The objective of the PHBW is to provide the soldier with a temporary means of maintaining personal hygiene and sanitation when water/showers are not available. The PHBW will improve personal hygiene, morale and quality of life of the soldier in the field when water is not available. Statistically designed technical user tests of several typical commercially available wipes were conducted. The wipe selected as the most suitable for the soldier was one of the most effective soil removers, the most cost effective and was readily available from commercial sources. The formulation in the wipe is used on babies and is alcohol free and hypo-allergenic. Ingredients include cocoamphodi-acetate, aloe gel, lanolin, water, propylene glycol, preservatives and an adult fragrance. Toxicity clearance was granted by the Army Materiel Command Surgeon. The size of the wipes will be at least 7.2 x 8.5 and will be packed 12 wipes per package. A resealable label will allow removal of one wipe at a time. The PHBW will be managed by the General Service Agency and will be issued through the Class I distribution system. It will be regulated by revised Commercial Item Description A-A-641B, Hand Cleaner, Body Wipe (Pre-moistened Paper Towelette in a Packet). DTIC

[ACTIVITIES OF THE INSTITUTE FOR THE STUDY OF HUMAN CAPABILITIES] Final Technical Report, 1 Jun. 1990 - 31 May 1994

Charles S. Watson 31 May 1994 124 p
(Contract AF-AFOSR-0215-90)
(AD-A286471; AFOSR-94-0721TR) Avail: CASI HC A06/MF A02

During the final year of the award we devoted considerable time to an evaluation of the Institute's activities during its first years of operation. A great deal has been accomplished, as described in this report and the annual reports that preceded it. It was recognized in our final evaluation of the Institute's accomplishments, however, that the central theme of 'human capabilities' too broad to accurately represent the range of research conducted by our associated investigators. There is a need to identify more precisely the specific practical area or areas of science to which our research is applicable. Partly as a result of consultation with one of our visiting scientists, Dr. Gilbert Ricard from Grumman Aircraft Corporation, we have elected to limit the Institute's future research focus to the subject of Human-Computer Interaction (HCI). FUZZY CLUSTERING OF FACIAL FORM FOR PROTOTYPING ENVIRONMENTAL PROTECTION EQUIPMENT

D. G. Robinson (GRAM, Inc., Albuquerque, NM.) 1994 6 p Presented at the International Joint Conference of the North American Fuzzy Information Processing Society and the Industrial Fuzzy Control and Intelligent Systems Conference and the NASA Joint Workshop on Neural Networks and Fuzzy Logic, San Antonio
(Contract DE-AC04-94AL-85000)
(DE94-014657; SAND-94-1354C; CONF-941219-1) Avail: CASI HC A02/MF A01

Emphasis on the human-to-aircraft interface has magnified in importance as the performance envelope of today's aircraft has continued to expand. A major problem is that there has been a corresponding increase in the need for better fitting protection equipment and unfortunately it has become increasingly difficult for aircrew members to find equipment that will provide this level of fit. While protection equipment has, historically had poor fit characteristics, the issue has grown tremendously with the recent increase in the numbers of minorities and women. Fundamental to this problem are the archaic methods for sizing individual equipment and the methods for establishing a sizing system. This paper documents recent investigations by the author into developing new methods to overcome these problems. Research centered on the development of a new statistically based method for describing form and the application of fuzzy clustering using the new shape descriptors. A sizing system was developed from the application of the research; prototype masks were constructed and the hardware tested under flight conditions. DOE

CIRCUIT MEANS FOR PROVIDING COMPATIBILITY BETWEEN TWO SEPARATE DIGITAL DATA INTERFACES Patent Application
James T. Michell, inventor (to Navy) 4 Mar. 1994 36 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-D016225; US-Patent-Appl-SN-207311) Avail: CASI HC A03

A computing device for providing compatibility between two separate digital interfaces is disclosed. The computing device adapts the power that is available from a first computer to supply the voltage to circuit elements that are interconnected to the two different digital interfaces. A computing device is disclosed that provides communications, in a half-duplex manner, between first and second general purpose computers. The first computer has a digital data interface conforming to the specifications of MIL-STD-1397A (NTDS fast) protocol with NTDS fast voltages, and the second computer is a commercial type having a 'Flag In/Device Flag Out' protocol with complementary transistor logic (CTL) voltages. The computing device provides compatibility for the logic levels of the associated signals, control words, and data words of each of the separate digital data interfaces. Algorithm means are to be installed in the commercial computer which can control said computing device to make its logic components conform to MIL-STD-1397A, and are disclosed. DTIC

HARDWARE IMPLEMENTATION OF A DESKTOP SUPERCOMPUTER FOR HIGH PERFORMANCE IMAGE PROCESSING. COLOR IMAGE PROCESSING USING CELLULAR NEURAL NETWORKS Technical Report, 1 Aug. - 1 Nov. 1994
Jose P. DeGyvez Nov. 1994 11 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-94-1-0516)
(AD-A286455; Rept-93-549/3) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This report addresses the functional behavior of Cellular Neural Networks (CNN). The impact of variable convergence times on the proper operation of the network is discussed. A test method is presented to determine the functionality of the network. The function fault models assume that the cells are unable to switch between limiting states. The proposed method attains 100% stuck-at fault coverage without any extra hardware for its implementation. Moreover, the required number of test vectors is constant and independent of the array size which makes it suitable for practical implementations. The report discusses the new fault model, presents the algorithmic procedures and shows simulated testing results. DTIC

PVM A PLATFORM FOR PORTABLE DISTRIBUTED COMPUTING
G. A. Geist 1 Jun. 1994 13 p Presented at the High Performance Computing Conference, Singapore, Singapore, 29-30 Sep. 1994
(Contract DE-AC05-84OR-21400)
(DE94-019156; CONF-9409206-1) Avail: CASI HC A03/MF A01

PVM (Parallel Virtual Machine) is a byproduct of the heterogeneous network research project going on at Oak Ridge National Laboratory and the University of Tennessee. It is a software package that permits a user defined collection of serial, parallel, and vector computers to appear as one large distributed memory computer. PVM's popularity is quickly making it the worldwide de facto standard for distributed computing. Applications, which can be written in FORTRAN or C, can be parallelized by using simple message-passing constructs common to most distributed-memory computers. By sending and receiving messages, subtasks of an application can cooperate to solve a problem in parallel. This paper describes the features of the latest release of PVM (version 3.3) and describes the major new research areas being explored in heterogeneous network computing. The paper explains how PVM version 3 opens many new opportunities in distributed computing, and how several technical and social challenges must be addressed before distributed computing can be taken into the 21st century. DOS is an acronym for Disk Operating System. It is actually a set of programs that allows you to control your personal computer. DOS offers the capabilities to create and manage files; organize and maintain information placed on disks; use application programs such as WordPerfect, Lotus 123, Excel, Windows, etc. In addition, DOS provides the basic utilities needed to copy files from one area to another, delete files and list files. The latest version of DOS also offers more advanced features that include hard disk compression and memory management. Basic DOS commands are discussed. DOE

DESIGN OF A 10 BIT 10k Samples/s LOW POWER CMOS ADC
S. A. Tunheim and J. Gakkestad 25 Apr. 1994 28 p
(PB95-110425; STF31-A94020) Avail: Issuing Activity (National Technical Information Service (NTIS))

This technical report describes a 10 bit 10k samples/s low power CMOS analog to digital converter (ADC). The ADC is implemented with a successive approximation architecture with an inherent sample and hold function. A resistor string is used to determine the five most significant bits, while a capacitor array is used to define the five least significant bits (voltage scaling - charge scaling technique). With respect to monotonicity and input capacitance, this method is in many cases favorable compared with other ADC architectures. The ADC has been designed in the AMS 1.2 micron CMOS process (CAE). The accuracy of the ADC is 10 bits at 10 kS/s conversion rate. The maximum power consumption is estimated to be less than 4.1 mW, and the typical power consumption at +27 C is 2.4 mW. NTIS

VERIFICATION OF A TIMESTAMP-BASED SLIDING-WINDOW PROTOCOL
A. L. Olah 1994 35 p
(PB95-132759; Memo-INF-94-42) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

The authors present the verification and analysis of a sliding-window protocol which uses sequence numbers and timestamps to achieve reliable, flow-controlled data transfer over an unreliable network. The timestamps are used to prevent hazards present in very high-speed networks due to the too fast wrap-around of sequence numbers. The protocol the authors analyze in this paper models the PAWS (protect against wrapped sequence numbers) mechanism, a proposed extension of the Transmission Control Protocol (TCP) of the Internet protocol suite. Some modifications are made on the original proposal to eliminate a possible hazard which was revealed during the formal analysis and to extend it with selective acknowledgements. The protocol is specified as an event-driven system using a system model which is capable to express real-time properties, such as packet lifetimes in the network, maximum transmission rate and clock skew. The authors take into account that both sequence numbers and timestamps are represented as finite numbers and give sufficient conditions for the safe reuse of these identifiers. Informal arguments about the sharpness of the sufficient conditions are also presented. NTIS

HIGH SPEED OPTICAL STORAGE TECHNOLOGY Final Report, Apr. 1992 - Aug. 1993
David R. Kaiser, Edward C. Gage, Daniel Sillick, and Michael Meichle Sep. 1994 63 p
(Contract F30602-92-C-0076)
(AD-A285788; RL-TR-94-118) Avail: CASI HC A04/MF A01

The objective of the effort was to investigate and demonstrate by means of a breadboard model, a high performance 14-inch digital optical system with the following specifications: (1) 25 Mbps minimum sustained user data rate; (2) 5.0 GB per side minimum user data capacity; (3) Double-sided media capacity of 10.0 GigaBytes; (4) Magneto-Optic media which is erasable and reusable many times with a design goal of 10,000 write/read/erase cycles; and (5) Effective corrected bit error rate of less than 1 bit in 10(exp 12) bits. In order to achieve a low life cycle cost system, off-the-shelf technology and utilization of commercial developments were employed. This approach was realized in the optical head design and the tracking servo system. Successful completion of this effort has laid the foundation for a next-generation optical jukebox system. DTIC

EXPERIMENTAL EVALUATION OF DYNAMIC DATA ALLOCATION STRATEGIES IN A DISTRIBUTED DATABASE WITH CHANGING WORKLOADS Final Report
Anna Brunstrom (College of William and Mary, Williamsburg, VA.), Scott T. Leutenegger (Denver Univ., Denver, CO.), and Rahul Simha (College of William and Mary, Williamsburg, VA.) Jan. 1995 18 p
(Contract NAS1-19480; RTOP 505-90-52-01)
(NASA-CR-195024; NAS 1.26:195024; ICASE-95-2) Avail: CASI HC A03/MF A01

Traditionally, allocation of data in distributed database management systems has been determined by off-line analysis and optimization. This technique works well for static database access patterns, but is often inadequate for frequently changing workloads. In this paper we address how to dynamically reallocate data for partionable distributed databases with changing access patterns. Rather than complicated and expensive optimization algorithms, a simple heuristic is presented and shown, via an implementation study, to improve system throughput by 30 percent in a local area network based system. Based on artificial wide area network delays, we show that dynamic reallocation can improve system throughput by a factor of two and a half for wide area networks. We also show that individual site load must be taken into consideration when reallocating data, and provide a simple policy that incorporates load in the reallocation decision. Author

INTRODUCTION TO THE FIRE ENGINE: A C++ TOOLKIT FOR FINITE AUTOMATA AND REGULAR EXPRESSIONS
B. W. Watson 17 May 1994 25 p
(PB95-110599) Avail: CASI HC A03/MF A01

This paper is an introduction to the programmer's interface of version 1.1 of the FIRE engine. The FIRE engine is a C++ class library implementing Finite automata and Regular Expression algorithms. The algorithms implemented in the toolkit are almost all of those presented in the taxonomies of finite automata algorithms. None of the implementation details of the library are discussed. The toolkit is unique in providing implementations of all of the known algorithms for constructing finite automata. The implementations, which were developed with efficiency in mind, are intended for use in production quality applications. No shell of graphical user-interface is provided, as the toolkit is intended for integration into applications. The implementations of the algorithms follow directly from the abstract algorithms. As such, the toolkit also serves as an educational example of the implementation of abstract algorithms. NTIS

DOMINOES
T. Kloks, D. Kratsch (Institut de Recherche en Informatique et Systemes Aleatoires, Rennes, France.), and H. Mueller (Friedrich-Schiller Univ., Jena, Germany.) Mar. 1994 24 p
(PB95-110680) Avail: CASI HC A03/MF A01

A graph is called a domino if every vertex is contained in at most two maximal cliques. The class of dominoes properly contains the class of line graphs of bipartite graphs, and is in turn properly contained in the class of claw-free graphs. We give some characterizations of this class of graphs, show that they can be recognized in linear time, give a linear time algorithm for listing all maximal cliques (which implies a linear time algorithm computing a maximum clique of a domino) and show that the pathwidth problem remains NP-complete when restricted to the class of chordal dominoes. PRSPLOT6 MANUAL
M. Hagen Aug. 1994 14 p Prepared in cooperation with Science Research Council, Daresbury, England; and Keele Univ., England
(PB95-110862; RAL-94-087) Avail: Issuing Activity (National Technical Information Service (NTIS))

The PRSPLOT6 program can be used to plot data from PRISMA experiments in the form of either extended zone dispersion relations or contour maps and can be used to extract (and plot) data from contour maps. The program is available on the ISISE and ISVS5 VAX VMS computers at the Rutherford Appleton Laboratory (RAL) and on the plotter SUN SPARCcenter (UNIX) computer at Keele. It uses plotting subroutines from the UNIRAS library. For most of the program the code is identical on both the VAX and UNIX systems, however, there is some system dependent code, to do with renaming files, creating sub-processes and the inability of UNIRAS to work properly on a terminal emulating a TEK 4010 on a UNIX system. The program is designed to let the user interactively create a plot at the terminal from data read in from a file(s) and then to get a postscript or color postscript output file. It consists of 11 commands and their qualifiers and parameters. The program can be run on: (1) terminals emulating a vt100 alpha and tektronix 4010 graphics setup (e.g. Pericom or Falco); (2) a color X11 terminal (or workstation, e.g. Vaxstation 3100 or 4000 or color Sun); or (3) a P.C. emulating a tektronix 4200 series color terminal (e.g. the TEEMTALK or EMUTEK emulators). VHDL MODELING OF PRC-70 RADIO ASICs FOR REVERSE ENGINEERING Technical Report, 1991 - 1994
Jared M. Brodsky Aug. 1994 166 p
(AD-A285740; ARL-TR-419) Avail: CASI HC A08/MF A02

Army Research Laboratory has been researching methods to maintain fielded-legacy systems built with technology that is no longer available in the commercial market. One method under examination is using the VHSIC hardware description language (VHDL) to document circuits for future redesign and reengineering for efficient reprocurement of spare electronic components. This report describes a case where structural VHDL modeling methods were studied while documenting the structure of three recently reengineered ASIC's. These three ASIC's form part of an antenna coupler board which is used in the AN/PRC-70 special operation forces radio. The report describes the steps used in setting up the structural models from the technology information models through the cell library models to the overall structure models of each ASIC. Through the description of the creation of the models a reader will be able to understand how the models allow future reengineering of these ASIC's to be technology independent. The report also describes the steps taken to validate the VHDL models and verify them against the actual design drawings using data taken from the results of simulating both. A number of obstacles were revealed during the simulation and verification of the models. An account of those obstacles and the solutions to them are also described. DTIC

A CONSTRUCT FOR DESCRIBING SOFTWARE DEVELOPMENT RISKS Final Report
David P. Gluch Jul. 1994 38 p
(Contract F19628-90-C-0003)
(AD-A284923; CMU/SEI-94-TR-14; ESC-TR-94-014) Avail: CASI HC A03/MF A01

This report establishes a representation of software risk wherein the risks associated with software-dependent development programs are defined as distinct, manageable risk entities. The risk entities and their descriptive statements of risk are based upon a condition - transition - consequence (CTC) construct. The CTC construct arises out of a systems representation, where time and value are identified as fundamental to the concept of risk. The CTC construct is also shown to provide a common representation for both program risks and program tasks and to fit into a heuristic framework for identifying risks within software-dependent development programs. Examples of risks are used to demonstrate that the approach facilitates the management of risk as an integral part of routine program management. DTIC

DESIGN OF A PARALLEL OBJECT ORIENTED PROGRAMMING LANGUAGE Final Report, 23 Feb. - 27 Sep. 1994
Daya Atapattu 26 Sep. 1994 20 p
(Contract DAAH01-94-C-R089)
(AD-A284924) Avail: CASI HC A03/MF A01

Object-oriented programming techniques have become a vital part of modern software engineering. Most large new commercial software products are designed today using object oriented principles along with supporting development environments and tools. Such methodology is particularly appealing for parallel computing, where there is great need for approaches capable of simplifying the programming task and producing high quality software more quickly. We have carried out research that will lead to a new parallel object-oriented language based on C++. The new language, C++-Linda, is a novel combination of the most widely used object-oriented language and a successful environment for parallel computing that supports a virtual shared memory model for process interaction. This combination is an especially appropriate one because Linda's memory model is naturally object-oriented, enabling a seamless design that is completely consistent with object-oriented methodology. We have carried out research to understand the basic issues underlying parallel object-oriented languages, and we have created a preliminary design for C++-Linda. DTIC

SOFTWARE FAULT TREE ANALYSIS OF CONCURRENT Ada PROCESSES M.S. Thesis
William Samual Reid, Jr. Sep. 1994 94 p
(AD-A284979) Avail: CASI HC A05/MF A01

The Automated Code Translation Tool (ACTT) was developed at Naval Postgraduate School to partially automate the translation of Ada programs into software fault trees. The tool works as follows: the Ada parser and lexical analyzer calls the ACTT upon recognition of an Ada statement; the ACTT produces a template representing the statement; the templates are linked together. The tool was lacking in that it only looked at a subset of Ada structures. The problem that this thesis addresses is the implementation of the missing language structures, specifically, concurrency and exception handling, to allow the ACTT to handle all of the Ada structures. The result is a tool that takes the Ada source code and provides the analyst with a sequence of templates, and summary information to assist in incorporating hazard information for generating a fault tree. DTIC

DETERMINING THE USABILITY OF DIGITAL VIDEO INTERACTIVE (DVI) TECHNOLOGY IN COMPUTER-BASED INSTRUCTION Final Report, May 1992 - May 1993
William J. Walsh, Elizabeth G. Gibson, Joseph P. Vasile, Albert McLain, and George Vigue Jul. 1994 101 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F33616-91-D-0651)
(AD-A284717; AL/HR-TP-1994-0018) Avail: CASI HC A06

The use of-advanced multimedia technologies can enhance computer-based instruction (CBI). This research sought to understand the usability of digital video interactive (DVI) for Air Force instructional designers. Findings were expanded to include the development of a model for multimedia development. Task analysis and process description data are also provided. Findings were that DVI technology is very difficult to use and AF users will better be able to employ software multimedia packages currently available. The multimedia development model developed during this project uses job, task, and observational data to provide process descriptions of multimedia development relying on the ISD model as the overall support structure. It is highly recommended this model be validated and automated for use by Air Force CBI developers. DTIC

ENHANCED VEHICLE AND EVENT TYPING SOFTWARE, PHASE 1 Progress Report
John T. Wagner and Z. E. Schwarzbein 3 Dec. 1993 28 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-93-C-0182)
(AD-A284862) Avail: CASI HC A03

Analyticon's Phase 1 SBIR effort emphasizes real-time typing of strategic military booster threats (ICBM's and SLBM's) from satellite-based infrared sensor measurements of received radiant intensity from their boost phase rockets. It is crucial to BMC3 planning and commanding of assets for strategic missile defense via boost-phase target interception and for TMD, BMD ground resources (sensor, weaponry) utilization, and early warning (EW) of threats. Accordingly it necessitates properly understanding salient analytical foundations, automating candidate algorithm concepts, and resolving key algorithm-implementation issues. The upshot is an upgraded largely radiometric typing procedure couched entirely in sensor (i.e. focal plane) coordinates, that obviates reliance on formal launch point estimation information, readily uses target motion and all intensity measurements, and expediently combines/amplifies available multi-color data. Our baseline typer entails judicious variants, configured per selected performance criteria/payoffs and input data pre-conditioning, of a decision-making process commonly known as a Fisher technique of cluster analysis for ascertaining the best decision space (i.e. coordinates of a measurement hyperspace), that is combined with a general Likelihood Ratio Test (LRT) of hypotheses testing for the accompanying decision rule (i.e. classification strategy) DTIC

GUIDELINES FOR THE CREATION AND MANAGEMENT OF GEOGRAPHIC DATA BASES WITHIN A GIS ENVIRONMENT, VERSION 1.0
R. C. Durfee, M. L. Land, R. A. McCord, R. J. Olson, J. K. Thomas, E. P. Tinnel, and L. D. Voorhees Jul. 1994 79 p
(Contract DE-AC05-84OR-21400)
(DE94-019214; ES/ER/TM-56/V1) Avail: CASI HC A05/MF A01

A Geographic Information System (GIS) provides the ability to manage and analyze all types of geographic and environmental information. It performs these functions by providing the tools necessary to capture, access, analyze, and display spatially referenced information in graphic and tabular form. Typical data elements that can be visualized in a map might include roads, buildings, topography, streams, waste areas, monitoring wells, groundwater measurements, soil sample results, landcover, and demography. The intent of this document is to provide data management and quality assurance (QA) guidelines that will aid implementors and users of GIS technology and data bases. These guidelines should be useful in all, phases of GIS activities, including the following: (1) project planning; (2) data collection and generation; (3) data maintenance and management; (4) QA and standards; (5) project implementation; (6) spatial analysis and data interpretation; (7) data transformation and exchange; and (8) output and reporting. The daily use of desktop GIS technologies within Martin Marietta Energy Systems, Inc. (Energy Systems), is a relatively new phenomenon, but usage is increasing rapidly. Large volumes of GIS-related data are now being collected and analyzed for the U.S. Department of Energy (DOE) Oak Ridge Reservation (ORR) and its facilities. It is very important to establish and follow good data management practices for GIS. DOE

NOMADS GRAPHICAL USER INTERFACE VERSION 2.0 USER'S MANUAL Final Report
Peter J. Sakalaukus Sep. 1994 19 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-93-C-6010)
(AD-A286314; COAM-TM-2/95) Avail: CASI HC A03

The Naval Ocean Models and Acoustic Demonstration System (NOMADS) V1.0 is a collection of individual programs accessed through a less-than-optimal screen-menu interface. It is presently being used to test and evaluate the Modular Ocean Data Assimilation System (MODAS). The current NOMADS Graphical User Interface (GUI) V2.0 is mouse (event) driven, which makes it simpler and faster to access and execute the different aspects of the NOMADS software. Additionally, the NOMADS GUI has an increased error-checking ability as well as a near 'bullet-proof' design. The NOMADS GUI V2.0 also has the characteristic that it may be altered or enhanced with additional functions and tools with minimal programming, due to the modular approach that was used in its design. TRULY DISTRIBUTION-INDEPENDENT ALGORITHMS FOR THE N-BODY PROBLEM
S. Aluru, G. M. Prabhu, and J. Gustafson 1994 23 p Presented at the Supercomputing 1994 Meeting, Washington, DC, 14-18 Nov. 1994
(Contract W-7405-eng-82)
(DE94-014238; IS-M-789; CONF-941118-4) Avail: CASI HC A03/MF A01

The N-body problem is to simulate the motion of N particles under the influence of mutual force fields based on an inverse square law. Greengard's algorithm claims to compute the cumulative force on each particle in O(N) time for a fixed precision irrespective of the distribution of the particles. In this paper, we show that Greengard's algorithm is distribution dependent and has a lower bound of (Omega)(N log(sup 2) N) in two dimensions and (Omega)(N log(sup 4) N) in three dimensions. We analyze the Greengard and Barnes-Hut algorithms and show that they are unbounded for arbitrary distributions. We also present a truly distribution independent algorithm for solving the N-body problem in (Omega)(N log N) time in two dimensions and in (Omega)(N log(sup 2) N) time in three dimensions. DOE

SYNTH: A SPECTRUM SYNTHESIZER
W. K. Hensley, A. D. McKinnon, H. S. Miley, M. E. Panisko, and R. M. Savard Jul. 1994 7 p Presented at the Institute of Nuclear Materials Management Annual Meeting, Naples, FL, 17-20 Jul. 1994
(Contract DE-AC06-76RL-01830)
(DE94-015943; PNL-SA-23879; CONF-940748-30) Avail: CASI HC A02/MF A01

A computer code has been written at the Pacific Northwest Laboratory (PNL) to synthesize the results of typical gamma-ray spectroscopy experiments. The code, dubbed SYNTH, allows a user to specify physical characteristics of a gamma-ray source, the quantity of the nuclides producing the radiation, the source-to-detector distance and the type and thickness of absorbers, the size and composition of the detector (Ge or NaI), and the electronic set up used to gather the data. In the process of specifying the parameters needed to synthesize a spectrum, several interesting intermediate results are produced, including a photopeak transmission function vs energy, a detector efficiency curve, and a weighted list of gamma and x rays produced from a set of nuclides. All of these intermediate results are available for graphical inspection and for printing. SYNTH runs on personal computers. It is menu driven and can be customized to user specifications. SYNTH contains robust support for coaxial germanium detectors and some support for sodium iodide detectors. SYNTH is not a finished product. A number of additional developments are planned. However, the existing code has been compared carefully to spectra obtained from National Institute for Standards and Technology (NIST) certified standards with very favorable results. Examples of the use of SYNTH and several spectral results will be presented. DOE

AN OBJECT-ORIENTED OPTIMIZATION SYSTEMS
G. S. Cunningham, K. M. Hanson, G. R. Jennings, Jr., and D. R. Wolf 1994 8 p Presented at the Institute of Electrical and Electronics Engineers (IEEE) International Conference on Image Processing, Austin, TX, 13-16 Nov. 1994
(Contract W-7405-eng-36)
(DE94-016190; LA-UR-94-2649; CONF-9411104-2) Avail: CASI HC A02/MF A01

We have described the implementation of a graphical programming tool in the object-oriented language, Smalltalk-80, that allows a user to construct a radiographic measurement model. The measurement model can be used to generate the measurements predicted by a given parameterized model of an experimental object. In this paper, we describe extensions to the graphical programming tool that allow it to be used to perform Bayesian inference on very large sets of object parameters, given real experimental data, by optimizing the likelihood or posterior probability of the parameters, given the real data. MESHES: THE NEXT GENERATION
M. Christon, D. Hardin, J. Compton, and M. Zosel 29 Aug. 1994 3 p Presented at the Supercomputing 1994 Meeting, Washington, DC, 14-18 Nov. 1994
(Contract W-7405-eng-48)
(DE94-016702; UCRL-JC-118234; CONF-941118-6) Avail: CASI HC A01/MF A01

Building complex meshes for large-scale numerical simulations presents immense difficulties in exploiting high-performance computers. Industry and research leaders will describe the current state of the art for generating meshes for such large scientific problems. This will be followed by a panel and general audience discussion of the algorithmic and architectural issues surrounding the generation of meshes with 10(exp 7) to 10(exp 9) grid points. (Note: The terms 'mesh' and 'grid' are used interchangeably in the literature.) DOE

COMPARISON OF WARD AND MELLOR'S TRANSFORMATION SCHEMA WITH STATE- AND ACTIVITYCHARTS
Jan Peleska (Deutsche System-Technik G.m.b.H., Kiel, Germany.), Cornelis Huizing, and Carsta Petersohn (Kiel Univ., Germany.) Mar. 1994 40 p
(PB95-110698) Avail: CASI HC A03/MF A01

A comparison between Structured Methods, as represented by the Essential Model of Ward & Mellor's Transformation Schemas, and the Statemate specification language consisting of State- and Activitycharts, is presented. The comparison is based on the languages' semantic properties. An example from the field of fault-tolerant systems serves as a 'benchmark problem' to investigate the practical applicability of both Transformation Schemas and Statemate in a context of meaningful 'real-world' systems. While the article's contents is founded on formal mathematical concepts, its objective is also to reach the software engineers and CASE tool builders who are not neccessarily experts in the field of Formal Methods. Therefore all the authors' results are presented in an informal natural-language style of reasoning. NTIS

ADAPTIVE PATH PLANNING FOR FLEXIBLE MANUFACTURING
Pang C. Chen 1994 7 p Presented at the 1994 International Conference on Computer Integrated Manufacturing and Automation Technology, Troy, NY, 10 Oct. 1994
(Contract DE-AC04-94AL-85000)
(DE94-016561; SAND-94-2005C; CONF-9410167-1) Avail: CASI HC A02/MF A01

Path planning needs to be fast to facilitate real-time robot programming. Unfortunately, current planning techniques are still too slow to be effective, as they often require several minutes, if not hours of computation. To overcome this difficulty, we present an adaptive algorithm that uses past experience to speed up future performance. It is a learning algorithm suitable for automating flexible manufacturing in incrementally-changing environments. The algorithm allows the robot to adapt to its environment by having two experience manipulation schemes: For minor environmental change, we use an object-attached experience abstraction scheme to increase the flexibility of the learned experience; for major environmental change, we use an on-demand experience repair scheme to retain those experiences that remain valid and useful. Using this algorithm, we can effectively reduce the overall robot planning time by re-using the computation result for one task to plan a path for another. DOE

SOFTWARE MERGE: SEMANTICS OF COMBINING CHANGES TO PROGRAMS Interim Report
Valdis Berzins Dec. 1993 33 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A279657; NPSCS-93-011) Avail: CASI HC A03

We present a language-independent semantic model of the process of combining changes to programs. This model extends the domains used in denotational semantics (complete partial orders) to Boolean algebras, and represents incompatible modifications as well as compatible extensions. The model is used to define the intended semantics of change merging operations on programs and to establish some general properties of software merging. We determine conditions under which changes to subprograms of a software system can be merged independently and illustrate cases where this is not possible. DTIC

COMPUTER-AIDED STRUCTURAL ENGINEERING (CASE) PROJECT. USER'S GUIDE: COMPUTER-AIDED STRUCTURAL MODELING (CASM). VERSION 5.00 Final Report
David Wickersheimer, Gene McDermott, Ken Taylor, and Carl Roth Apr. 1994 415 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DACA39-86-C-0024)
(AD-A279913; WES/IR/ITL-94-2) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

CASM stands for Computer Aided Structural Modeling. It is a program designed to aid the structural engineer in the preliminary design and evaluation of structural building systems by the use of 3-D interactive graphics. Think of this program as a scratch pad for the structural decision process that would have been done on paper before you went to the computer to do the final numerical analysis of structural members. CASM will let you change your mind quickly and give you results that previously might have taken hours to obtain. By allowing quick changes, CASM allows you to make more informed decisions in the initial structural evaluation process. DTIC

TOWARDS BETTER QUALITY AND RELIABILITY IN THE SOFTWARE REUSE LIBRARY ENVIRONMENT M.S. Thesis
Kenneth M. Warburton 24 Mar. 1994 103 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A280013) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

In today's DOD software environment, where systems of enormous size, complexity and cost are the norm, economic conditions are driving DOD system developers to seek ways to increase productivity while decreasing product defects. To achieve its goals, DOD has taken the approach of integrating reuse into the software development process. In 1992, DISA established its Software Reuse Program to serve as a prototype for the DOD-wide reuse initiative. This thesis will look at DISA's effort to support DOD's reuse vision. Specifically, it will discuss DISA's software reuse library management and will introduce a methodology for the collection and analysis of metrics relating to software performance in order to improve library software quality. This thesis concludes that metrics can play a key role in any organization's software quality program. While metrics alone are not a solution to the reuse quality problem, they are a tool to be used prudently by the software quality manager to manage and improve the quality of organizational software. MEASURING PRESENCE IN VIRTUAL ENVIRONMENTS Final Report, Jan. 1993 - Apr. 1994
Bob G. Witmer and Michael F. Singer Oct. 1994 54 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DA Proj. 2Q1-62785-A-790)
(AD-A286183; ARI-TR-1014) Avail: CASI HC A04

A primary argument for the efficacy of virtual environments (VE) applications is that the user is 'present' in the simulated environment. Presence is defined as the subjective experience of being in one environment (there) when physically in another environment (here). Presence may be based on external factors and internal tendencies that support both awareness of the current situation and the transition from the immediate physical location (here) to a remote or artificial environment (there). These factors are labeled as immersive because they may lead to the experience of presence. Some major immersive factors identified in current literature or hypothesized as contributing to presence are briefly reviewed. These concepts and ideas have been used as the basis for two questionnaires. An immersive tendencies questionnaire (ITQ) was developed to investigate possible correlates that may indicate an individual's tendency to experience more or less presence in artificial environments. The presence questionnaire (PQ) addresses different factors or features peculiar to the artificial environment that may affect the experience of presence, or the capability to immerse oneself, in that environment. The results of administration of these questionnaires, in conjunction with an experiment on the performance of basic tasks in VE, are presented. These results should be considered preliminary and interpreted with caution because of the small number of subjects involved. Analyses indicate reasonable reliability values for the ITQ and PQ. DTIC

HIGH PERFORMANCE COMPUTING FOR MATERIALS PROCESS MODELING
T. Zacharia, M. A. Bjerke, and S. Simunovic 1993 9 p Presented at the American Welding Society International Conference on Modeling and Control of Joining Processes, Orlando, FL, 8-10 Dec. 1993
(Contract DE-AC05-84OR-21400)
(DE94-017860; CONF-931234-9) Avail: CASI HC A02/MF A01

Advanced mathematical techniques and computer simulation play a major role in providing enhanced understanding of conventional materials processing operations such as welding and joining. Many of these numerical models are highly compute-intensive. It is not unusual for an analysis to require several hours of computational time on current supercomputers despite the simplicity of the models being studied. As computer simulations and materials databases grow in complexity, massively parallel computers have become important tools. This paper briefly describes massively parallel computational research at the ORNL with the objective of providing fundamental insight into the welding process. DOE

KERNEL MUCKING IN TOP
W. LeFebvre 1994 12 p Presented at the 8th System Administration Conference, San Diego, CA, 21-23 Sep. 1994
(Contract W-31-109-eng-38)
(DE94-017077; ANL/DIS/CP-83108; CONF-9409186-1) Avail: CASI HC A03/MF A01

For many years, the popular program top has aided system administrations in examination of process resource usage on their machines. Yet few are familiar with the techniques involved in obtaining this information. Most of what is displayed by top is available only in the dark recesses of kernel memory. Extracting this information requires familiarity not only with how bytes are read from the kernel, but also what data needs to be read. The wide variety of systems and variants of the Unix operating system in today's marketplace makes writing such a program very challenging. This paper explores the tremendous diversity in kernel information across the many platforms and the solutions employed by top to achieve and maintain ease of portability in the presence of such divergent systems. PROCEEDINGS OF THE 4TH SYSTEMS REENGINEERING TECHNOLOGY WORKSHOP
Bruce I. Blum Sep. 1994 412 p Workshop held in Monterey, CA, 8-10 Feb. 1994
(Contract N00039-91-C-0001)
(AD-A285357; JHU/APL-TG-1386) Avail: CASI HC A18/MF A04

The Navy has invested significant resources in the development of large and complex systems that must be modified and extended to respond to changing requirements. However, many of these systems are based on archaic automation technologies that do not support modern hardware and software engineering methodologies or maintenance strategies. Consequently, system modification has become increasingly complex. To reduce the complexity, developers can employ reengineering techniques to create new systems. This report contains the papers presented at the Fourth Systems Reengineering Technology Workshop sponsored by the Naval Surface Warfare Center. The papers discuss theoretical and applied techniques that can be used to facilitate systems reengineering efforts. Specific topics include design issues in systems reengineering, reuse in reengineering and forward engineering, experience reports, reengineering translation and transformation, evaluating a reengineering project, tools for reengineering, engineering science and reengineering, the impact of object orientation, and approaches to reengineering. AUTOMATION SUPPORT FOR CONCURRENT SOFTWARE ENGINEERING M.S. Thesis
Salah Badr Dec. 1993 26 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A279691; NPS-CS-93-013) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This paper presents an evolution control system that provide automated assistance for the software evolution process in an uncertain environment where designer tasks and their properties are always changing. We view an Evolution Control System (ECS) as the agent that keeps track of proposed, ongoing, and completed changes to a software system. It provides automated assistance to the software evolution manager to help him/her make the right decisions. It automatically propagates change consequences by constructing the set of possibly affected modules. It also coordinates change implementation activities within the design team in a way that supports teamwork and maintains system integrity, as well as adapting itself to the dynamic nature of the evolution process where new changes arrive randomly and ongoing modifications are themselves subject to change as more information becomes available. DTIC

FAULT-TOLERANCE IN DISTRIBUTED AND MULTIPROCESSOR REAL-TIME SYSTEMS Final Report, 1 Sep. 1992 - 31 Aug. 1993
Dhiraj K. Pradhan 31 Aug. 1993 41 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F49620-92-J-0383)
(AD-A279896; AFOSR-94-0330TR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

New schemes for fault-tolerance in multiprocessor and distributed systems have been developed in the following areas. We have investigated a number of fault tolerance schemes to evaluate performance, reliability, and availability trade-offs. Fault tolerance schemes are being developed for various fault models (tail-stop model, fail-slow model, and arbitrary failure model) and application areas (applications that are to provide results at the end of computation and applications that are long-running but should also provide results during computation). In the area of software-implemented fault tolerance, we are studying approaches for providing user transparent mechanisms for fault tolerance to design and implement a software library to which the user can link existing application software to achieve the desired level of fault tolerance. We are developing a new tool (Reliable Architecture Characterization Tool--REACT) for evaluating the reliability and availability of distributed multiprocessor systems using various fault tolerance techniques. This tool will facilitate evaluation of the fault tolerance schemes that we develop. DTIC

MEASURING SOFTWARE DEPENDABILITY BY ROBUSTNESS BENCHMARKING
Arup Mukherjee and Daniel P. Siewiorek May 1994 26 p Sponsored by Computer Sciences Corp. Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-4139)
(AD-A280053; CMU-CS-94-148) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Inability to identify weaknesses or to quantify advancements in software system robustness frequently hinders the development of robust software systems. Efforts have been made to develop benchmarks of software robustness to address this problem, but they all suffer from significant shortcomings. This paper presents the various features that are desirable in a benchmark of system robustness, and evaluates some existing benchmarks according to these features. A new hierarchically structured approach to building robustness benchmarks, which overcomes many deficiencies of past efforts, is also presented. This approach has been applied to building a hierarchically structured benchmark that tests part of the Unix file and virtual memory systems. The resultant benchmark has successfully been used to identify new response class structures that were not detected in a similar situation by other less organized techniques. DTIC

MAKING STRUCTURED GRAPHICS AND CONSTRAINTS PRACTICAL FOR LARGE-SCALE APPLICATIONS
Brad A. Myers, Dario A. Giuse, Andrew Mickish, and David S. Kosbie May 1994 26 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F33615-90-C-1465; ARPA Order 7597)
(AD-A280062; CMU-CS-94-150) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Providing a structured graphics model and a constraint system makes the programming of graphical applications significantly easier. In a structured graphics model, each graphic element on the screen is represented by a real object in the object system, while a constraint system automatically maintains relationships among the objects. Although many research systems and a few commercial environments provide structured graphics and constraints, none scale up to large interfaces with thousands of objects and thousands of constraints. This paper presents four techniques to overcome this problem: automatic elimination of constraints that depend only on values that do not change, layout hints to help with refresh and hit detection, virtual aggregates that only pretend to allocate objects for their components, and compiling composite aggregates into a single object with a complex draw method. These have been implemented as part of the Garnet environment, and we have demonstrated that together they allow structured graphics and constraints to scale up to applications with tens of thousands of objects and constraints without compromising the ease-of-use. COMPUTER GRAPHICS TOOLS FOR VISUALIZING GRAVITY GRADIENT TORQUES ON A RIGID SPACECRAFT M.S. Thesis
Jeffrey A. Stewart Sep. 1994 140 p
(AD-A285971) Avail: CASI HC A07/MF A02

This thesis provides students with a set of graphics tools allowing them to better visualize the effects of gravity-gradient torques on a rigid spacecraft in a low earth orbit. It allows the user to select from a variety of rigid bodies of different configurations, place them in any orientation at any altitude, apply the appropriate gravity-gradient moments to the body and immediately see the effect on the rigid body. This is accomplished through interactive computer graphics written to run on Silicon Graphics computers. The thesis includes a presentation of the theory involved in the programming of the physical properties and then discusses the basics of computer graphics including a more detailed look at the specific implementation for this thesis. A detailed user's guide is included to train students to use the tools as expeditiously as possible. It concludes with recommendations for further study in this area. DTIC

DESIGN AND IMPLEMENTATION OF VISUAL OBJECT-ORIENTED LOGO USING PROGRAPH M.S. Thesis
Emily M. Black and Thierno Fall Sep. 1994 99 p
(AD-A285977) Avail: CASI HC A05/MF A02

This thesis addresses the problem of how best to teach beginning programmers the necessary skills of object oriented programming. There is no established method of introducing object oriented concepts such as encapsulation, inheritance, and polymorphism, or providing an intuitive progression from simple programs to complex problem solving. The approach was to use two commercially available programming languages which we consider exemplify good object oriented programming techniques, to teach beginners how to program. We selected LOGO, which has been used successfully in the past as a first programming language for children. Then we added the concepts of visual programming through the use of Prograph, a language which provides a visual, object oriented, dataflow environment. The main result of our research is the design and implementation of a prototype language called Visual Object Oriented LOGO (VOOL). VOOL is intended for use at all levels of education to teach problem solving, object oriented concepts, and fundamental programming skills. VOOL was implemented on a Macintosh in the pictorial, iconic language of Prograph and fully supports the goals of this thesis. DTIC

EPICS SIMULATION TOOLS FOR CONTROL SYSTEM DEVELOPMENT
R. M. Wright, D. M. Kerstiens, G. D. Vaughn, and R. E. Weiss 1994 4 p Presented at the 17th International LINAC Conference, Tsukuba, Japan, 21-26 Aug. 1994
(Contract W-7405-eng-36)
(DE94-018082; LA-UR-94-2781; CONF-9408125-18) Avail: CASI HC A01/MF A01

When developing control system software there are many times when the ability to simulate the response of the instrumentation can be very useful. Examples are: (1) when the operator interface is being designed and the users want an idea of what the finished system might took like; (2) when the interface hardware is not yet available; (3) when the reaction of the control system to an error condition must be tested, but the actual occurrence of such an error would cause undesirable side effects; (4) when operators are being trained to use the system; (5) when an improvement or bug fix needs to be tested, but the running system cannot be shut down for long. The Experimental Physics and Industrial Control System (EPICS) provides tools for building simple simulations and interfacing to more complex simulations of accelerator hardware. At the lowest level an individual data channel can be switched to take its input from either a simulated data location or from the actual hardware. At a slightly higher level, sequences can be run on the real-time interface processor so that output to the hardware is intercepted and an appropriate substitute value is provided for the corresponding read-back records. At a still higher level a program can use the Channel Access software bus facility of EPICS to control some global aspect of an accelerator or can interface to an external accelerator simulation instead of the actual accelerator. The goal of testing control system software using simulated hardware is to minimize the changes required in shifting between the simulated system and the real system. The degree of success of the EPICS tools in meeting the minimum change goal will be addressed with suggestions for improvements. The implementation of simulated responses using EPICS tools will be discussed and examples of experience using the EPICS tools to create and interface to simulations will be given. DOE

MODEL FORMALITY IN HUMAN/COMPUTER COLLABORATION
Brian Harp and Robert Neches Mar. 1994 9 p Presented at the AAAI Symposium, Oct. 1993
(Contract MDA972-90-C-0060)
(AD-A286001; ISI/RR-94-383) Avail: CASI HC A02/MF A01

This paper describes a programming methodology called model-based programming which supports development of systems with complex activities accessing large volumes of data. This methodology utilizes multiple levels of data model formality providing some powerful features for systems that are built using this methodology. For example, unlike most traditional systems, information can be programmed into an application during all phases of the system lifecycle from development through daily use. Second, the way information is entered will dictate how much reasoning the system will perform on it. This provides options for the user when they enter information; they can enter information quickly and get less system management, or they can enter information more formally and the system will take-more responsibility. One important component of this programming environment provides a way for users to enter information that was not anticipated at development time - an important capability of a system is going to grow with it's increasingly expert users. This component called TINT (The Intelligent Note Taker) is explained in detail and issues of human/computer collaboration are discussed in the context of adding unanticipated information to complex systems. A NEW PROCESS FOR ACQUIRING SOFTWARE ARCHITECTURE Final Report
Thomas F. Saunders, Barry M. Horowitz, and Matt L. Mleziva Sep. 1994 26 p
(Contract F19628-94-C-0001)
(AD-A286012; ESC-TR-94-207) Avail: CASI HC A03/MF A01

This paper presents a process to control software architectures during the procurement of military systems. The proposed process extends from RFP preparation through contract award. Software architecture is defined and its role described in the acquisition of flexible defense systems-systems that must accommodate new missions, threats, and technologies. A series of attachments provide sample wording for Statements of Work, System/Segment Design Documents, Software Development Plans, and Instructions for Proposal Preparation to incorporate the architectural control process into DOD acquisitions. A SOFTWARE PROCESS FRAMEWORK FOR THE SOFTWARE ENGINEERING INSTITUTE'S (SEI) CAPABILITY MATURITY MODEL Final Report
Timothy G. Olson, James W. Over, and Neal R. Reizer Sep. 1994 820 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F19628-90-C-0003)
(AD-A286595; CMU/SEI-94-HB-01) Avail: CASI HC A99

The Software Process Framework (SPF) is a document that provides information contained in the SEI Capability Maturity Model (CMM) for Software v1.1 (Paulk93a) in a format suitable for process definition and improvement. The SPF allows users to determine if their organization's software process documentation is consistent with the recommendations made by the CMM. When organizational software process documentation is found to be inconsistent with the CMM, the SPF provides the ability to make informed decisions regarding the applicability of specific CMM recommendations. AN EMPIRICAL APPROACH TO LOGICAL CLUSTERING OF SOFTWARE FAILURE REGIONS M.S. Thesis
Alexander E. Hilaris Mar. 1994 190 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A279863) Avail: CASI HC A09

Previous work showed that faults in a program tend to cluster when viewed by the variables that affect execution and propagation of the fault (structural clustering). However, that study was quite preliminary and local in its investigation. This thesis examines clustering from two other perspectives, taxonomical (type of faults) and functional (area of affected functionality). The hypothesis tested was that faults tend to cluster when viewed from these perspectives. DTIC

SOFTWARE CAPABILITY EVALUATION (SCE), VERSION 2.0 TEAM MEMBERS GUIDE Final Report
Oct. 1994 421 p
(Contract F19628-90-C-0003)
(AD-A286082; CMU/SEI-94-HB02) Avail: CASI HC A18/MF A04

Software Capability Evaluation (SCE) is a method for independently evaluating the software process of an organization to gain insight into its software development capability. The method is defined in the report Software Capability Evaluation Version 2.0 Method Description. This document, the Software Capability Evaluation Version 2.0 Team Member's Guide, is intended for use by members of teams that will be conducting an SCE. The guide provides detailed step-by-step instructions and heuristic information to assist an SCE team in preparing for and conducting an evaluation. The Team Member's Guide is provided as a supplement to the SCE Team Training offered by the Software Engineering Institute. It is intended to be used in conjunction with the Method Description and with the Software Capability Evaluation Version 2.0 Implementation Guide (SCE 93A). The Team Member's Guide provides information to reinforce the training and it will serve as a reference for use after the training. DTIC

RATE MONOTONIC ANALYSIS FOR REAL-TIME SYSTEMS: INSTRUCTORS GUIDE Final Report

Ruth Ravenel and Ray Obenza Sep. 1994 47 p
(Contract F19628-90-C-0003)
(AD-A286083; CMU/SEI-94-EM-11) Avail: CASI HC A03/MF A01

This educational materials package has been developed for instructors of software engineering and, more specifically, real-time systems. This package will help instructors teach rate monotonic analysis (RMA) to graduate and undergraduate software, computer, and electrical engineering students. The package can also be used to teach RMA to continuing education students. The presentation materials and exercises included have been used by Ruth Ravenel in both graduate and undergraduate courses. These educational materials are intended to be used in conjunction with the videotape, An Introduction to Rate Monotonic Analysis, from SEI Technology Series. DTIC

BACKWARD ERROR RECOVERY IN REDUNDANT DISK ARRAYS

William V. Courtright, II and Garth A. Gibson 27 Sep. 1994 17 p
Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant NSF ECD-89-07068)
(AD-A286064; CMU-CS-94-193) Avail: CASI HC A03

Redundant disk arrays are single fault tolerant, incorporating a layer of error handling not found in nonredundant disk systems. Recovery from these errors is complex, due in part to the large number of erroneous states the system may reach. The established approach to error recovery in disk systems is to transition directly from an erroneous state to completion. This technique, known as forward error recovery, relies upon the context in which an error occurs to determine the steps required to reach completion, which implies forward error recovery is design specific. Forward error recovery requires the enumeration of all erroneous states the system may reach and the construction of a forward path from each erroneous state. We propose a method of error recovery which does not rely upon the enumeration of erroneous states or the context in which errors occur. When an error is encountered, we advocate mechanized recovery to an error-free state from which an operation may be retried. Using a form of backward error recovery, we are able to manage the complexity of error recovery in redundant disk arrays without sacrificing performance. DTIC

A TABULAR INTERFACE FOR AUTOMATED VERIFICATION OF EVENT-BASED DIALOGS

Hung-Ming Wang and Gregory Abowd (Georgia Inst. of Tech., Atlanta, GA.) 28 Jul. 1994 37 p
(AD-A286065; CMU-CS-94-189) Avail: CASI HC A03/MF A01

In this report, we investigate the feasibility of a tabular interface for the specification and analysis of event-based dialogues. These dialogues are used to define high-level descriptions of interactive systems, and they are based on Olsen's Propositional Production System (PPS) notation. The simulation of the abstract user-system dialogue is an effective means of matching a design with an expected task model. Monk and Curry have produced a prototype dialogue simulation tool, the Action Simulator, which demonstrates how a tabular paradigm can be used to specify and simulate the dialogue. Further analysis of the dialogue can uncover problems which are not, so easy to detect with simulation. If we view the dialogue as defining a finite state machine, then we can make use of powerful model verification tools, such as Clarke's Symbolic Model Verifier (SMV) tool, to perform more powerful analyses on the dialogue. We also find that the tabular paradigm for input is an interesting alternative to the input language for the SMV tool. We provide in this report a mechanical translation from the tabular dialogue specification into SMV and provide templates or heuristics for various reachability analyses using the Computation Tree Logic (CTL) formalism. This research, therefore, presents the beginnings of two significant contributions. For the HCI community, we show how model verification tools can be used to provide a more powerful analytic technique beyond simulation for the specification and design of interactive dialogues. For the model verification community, we demonstrate the possibility of developing a simpler interface to specify and analyze certain finite state machines. DTIC

ENVIRONMENT FOR TEST AND ANALYSIS OF DISTRIBUTED SOFTWARE (ETADS) Final Summary Report, 28 Mar. - 27 Sep. 1994

R. C. Cox and B. Allen 27 Sep. 1994 130 p
(Contract DASG60-94-C-0036)
(AD-A285776) Avail: CASI HC A07/MF A02

This final report describes results of the Phase 1 SBIR research effort to develop new software testing techniques capable of satisfying the demands of distributed real-time software environments. Traditional software testing techniques are inadequate for distribute systems due to such complicating factors as non-deterministic execution, real-time timing constraints, task interaction event sequencing, race conditions, etc. During the course of the Phase 1 effort, OTI investigate a wide variety of candidate technique. For each technique, OTI evaluated the feasibility and defined a research and development approach for the technique and required supporting technologies. Detailed comparison-of the attributes of each technique gives the following prioritization of techniques: Deterministic Execution Testing, Timing Analysis, Control Flow Testing, Dependency Analysis, Network Communication Testing, Data Flow Analysis, Problem Tracking Facility, Mutation Analysis, Static Concurrency Testing. OTI's research approach was based on developing new functionality on top of an existing software testing environment to construct the Environment for Test and Analysis of Distributed Software (ETADS). COYOTE II: A FINITE ELEMENT COMPUTER PROGRAM FOR NONLINEAR HEAT CONDUCTION PROBLEMS. PART 1: THEORETICAL BACKGROUND

David K. Gartling and Roy E. Hogan Oct. 1994 62 p
(Contract DE-AC04-94AL-85000)
(DE95-002587; SAND-94-1173-Pt-1) Avail: CASI HC A04/MF A01

The theoretical and numerical background for the finite element computer program, COYOTE II, is presented in detail. COYOTE II is designed for the multi-dimensional analysis of nonlinear heat conduction problems and other types of diffusion problems. A general description of the boundary value problems treated by the program is presented. The finite element formulation and the associated numerical methods used in COYOTE II are also outlined. Instructions for use of the code are documented in SAND94-1179; examples of problems analyzed with the code are provided in SAND94-1180. DOE

Xwake 1.0 USER'S MANUAL

G. Saewert, T. Jurgens, and F. Harfoush Jul. 1994 21 p
(Contract DE-AC02-76CH-03000)
(DE95-002528; FNAL-TM-1896) Avail: CASI HC A03/MF A01

Xwake is a user friendly Finite Difference Time Domain (FDTD) code for wake potential and impedance calculations of rotationally symmetric structures. Geometry boundaries are automatically meshed, or modeled, by a choice of either of two approximations, the typical 'stepped edge' modeling, or the new 'contour' modeling. Contouring means geometry boundaries described with curves and angles are not distorted to follow the rectangular grid; rather, the grid is adjusted to follow the contour of the geometry boundaries. It offers computer run time savings for large problems or intricate geometries for a given mesh compared with stepped edge modeling. Using stepped approximations with Xwake, on the other hand, one is able to model materials of any linear media type. Ultimately, three solutions are computed, wake potential versus wake length, wake spectrum versus frequency - a Fourier transform (FFT) of the wake potential, and wake impedance versus frequency. Xwake is an OSF/Motif application providing a graphical user interface (GUI) for ease of use. It is written in ANSI C for portability and currently runs on UNIX platforms. DOE

REAL-TIME RECONFIGURATION STUDY Final Report
Daniel Searles Aug. 1994 23 p
(Contract N00014-91-C-0129)
(AD-A286060) Avail: CASI HC A03/MF A01

The objective of the real-time reconfiguration study was to implement a physical test bed for testing and evaluating a suite of reconfiguration algorithms. The software architecture was composed of an operating system which supported real-time programming concepts, a set of model tasks, control software, and the suite of reconfiguration procedures. Rate monotonic scheduling was used to schedule the execution of the task set, as well as for testing the schedulability of new configurations. Of primary concern was the execution time of the reconfiguration algorithms. The general problem of reconfiguration is similar to the bin packing problem and is NP-Complete. This suite implements a concept of disturbance, a cost associated with moving a task from one CPU to another, to reduce execution time. The hardware platform was composed of a VME chassis populated with 5 Motorola 68030 CPU's. DTIC

STARS OR STRIPES: A COMPARATIVE STUDY OF FINITE AND TRANSFINITE TECHNIQUES FOR SURFACE MODELLING
C. W. A. M. vanOverveld and M. Verhoeven Jun. 1994 41 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB95-134979) Avail: CASI HC A03

Most geometric modeling systems employ a surface representation for four-sided patches, such as bi-cubic B-splines, which is based on a matrix of N x M control points for integer N and M. The boundary is defined by the 2N + 2M - 4 outermost control points whereas the remaining MN - 2N - 2M + 4 control points indicate the shape of the interior part of the surface. This is in sharp contrast with conventional hand-drafting techniques for curved surfaces, where only the boundary is drawn as a set of curve segments joining in the corners, and the shape of the interior part is usually left unspecified. The bicubic Coons patches make up a representation scheme for such surface which is much more intuitive in this respect. Yet, bicubic Coons patches seem to be not widely used in geometric modelling when compared with B-spline techniques. In this paper, the authors suggest some causes for this apparent mismatch between intuition and common CAGD (Computer Aided Geometric Design) - practice viz. difficulties of the interactive definition of boundary contours, the specification of cross-boundary derivatives, and a lack of control of the interior shape. Next, the authors propose remedies for all three types of problems. NTIS

SYSTEMS ANALYSIS LABORATORY. TEN YEARS OF PROGRESS 1984-1994
R. P. Haemaelaeinen 1994 68 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB95-104451; ISBN-951-22-2064-4) Avail: CASI HC A04

The activity report celebrates the 10th anniversary of the Systems Analysis Laboratory, of Helsinki University of Technology which was established in 1984 within the professorship of applied mathematics. The laboratory belongs to the Department of Mathematics and Systems Analysis in the Faculty of Information Technology. The goals of the present Systems Analysis Laboratory is to cover the area of systems science comprehensively ranging from the mathematical theories of optimization, control and decision making to algorithms, practical modeling and decision support systems based on modern information technology. The focus of interest in applications is in complex energy, production and environmental systems. The problems are analyzed with a balanced engineering-economic systems approach. The report describes the current courses and research activities. It also summarized output in terms of publications and degree theses during the past ten years. NTIS

GENERATING EXAMPLES FOR USE IN TUTORIAL EXPLANATIONS: THE USE OF A SUBSUMPTION BASED CLASSIFIER
Vibhu O. Mittal and Cecile L. Paris Jun. 1994 18 p
(Contract DABT63-91-C-0025; NSF IRI-90-03087)
(AD-A286028; ISI/RR-94-384) Avail: CASI HC A03/MF A01

Examples form an integral and very important part of many descriptions, especially in contexts such as tutoring and documentation generation. Previous computational work on example generation has focused on the issue of generating valid examples in different domains. However, there are a large number of examples that can be generated for a given concept, and it is important that examples intended for tutoring situations illustrate specific features that need to be communicated. There is also a strong interaction between the examples and the accompanying textual description. The number of examples to be presented, the order in which they are to be presented, and the position of the examples with respect to the text are all dependent upon the examples generated for use in the presentation. It is therefore important that the example generator be able to generate a set of suitable examples in response to a tutoring goal in a given situation. In this paper, we present one framework, based on the use of a subsumption classifier, that facilitates the generation of appropriate tutorial examples. We illustrate the working of this framework by describing the generation of examples to illustrate the syntax in the programming language LISP. DTIC

NEXT GENERATION SOLID MODELLERS FOR ELECTRONIC PROTOTYPING Final Report, 15 Feb. 1993 - 14 Feb. 1994
Debasish Dutta and Gunzburger 26 Jul. 1994 5 p
(Contract F49620-93-1-0149; AF Proj. 2304)
(AD-A286525; AFOSR-94-0745TR) Avail: CASI HC A01/MF A01

In this research project, we are focusing on expanding the geometric coverage of solid modellers such that a wider variety of objects can be modelled accurately. Solid modellers are large computer programs that enable a designer to construct, interrogate and manipulate computer models of physical objects. They are at the core of every computer system for engineering analysis, prototyping, manufacture and inspection. Various manufacturing tasks can be simulated in the computer and electronic mock-ups (i.e., prototypes) can be created prior to actual manufacture. DTIC

GOLD: A GRAPH ORIENTED LANGUAGE FOR DATABASES
R. Post and P. DeBra Sep. 1993 58 p
(ISSN 0926-4515)
(PB95-127544) Avail: CASI HC A04/MF A01

A simple and powerful graph transformation language for databases is defined whose operations are themselves graphs. It was designed to remedy some of the shortcomings of the Graph-Oriented Object Database (GOOD) language, particularly, its restricted syntax for operations and its dependence on the rather awkward abstraction operator. The new language, Graph Oriented Language for Databases (GOLD), has only one operation; operations of GOOD are included as special cases. Thanks to a new idea, the core pattern, many more forms of node addition can be specified with this one operation; abstraction becomes superfluous. Due to its capability to add multiple nodes at once, GOLD surpasses GOOD in expressive power: queries are always generic, but they are not restricted to be constructive. The simpler forms of the GOLD operation have straightforward interpretations. Instead of imposing syntactic restrictions, the GOLD definition extends the semantics to cover a very broad range of expressions. NTIS

COMPOSITIONAL PROOF THEORY FOR FAULT TOLERANT REAL-TIME DISTRIBUTED SYSTEMS
Henk Schepers and Rob Gerth 1994 42 p See also PB94-126737 Sponsored by Dutch STW
(ISSN 0926-4515)
(PB95-127601) Avail: CASI HC A03/MF A01

In this report we present a compositional network proof theory to specify and verify fault tolerant real-time distributed systems. Important in such systems is the failure hypothesis that stipulates the class of failures that must be tolerated. In the formalism presented in this report, the failure hypothesis of a system is represented by a predicate which expresses how faults might transform the observable input and output behavior of the system. A proof of correctness of a triple modular redundant system is given to illustrate our approach. NTIS

DAVE: A PLUG AND PLAY MODEL FOR DISTRIBUTED MULTIMEDIA APPLICATION DEVELOPMENT
R. F. Mines, J. A. Friesen, and C. L. Yang Jul. 1994 15 p Presented at the 8th ACM International Conference on Supercomputing, Manchester, England, 11-15 Jul. 1994
(Contract DE-AC04-94AL-85000)
(DE94-016481; SAND-94-8233; CONF-940756-1) Avail: CASI HC A03/MF A01

This paper presents a model being used for the development of distributed multimedia applications. The Distributed Audio Video Environment (DAVE) was designed to support the development of a wide range of distributed applications. The implementation of this model is described. DAVE is unique in that it combines a simple 'plug and play' programming interface, supports both centralized and fully distributed applications, provides device and media extensibility, promotes object reusability, and supports interoperability and network independence. This model enables application developers to easily develop distributed multimedia applications and create reusable multimedia toolkits. DAVE was designed for developing applications such as video conferencing, media archival, remote process control, and distance learning. DOE

PRSCAL MANUAL
M. Hagen Aug. 1994 26 p Prepared in cooperation with Keele Univ., England
(PB95-130480; RAL-94-084) Avail: Issuing Activity (National Technical Information Service (NTIS))

The PRSCAL program is a 'simulation' version of the PRISMA operating program. The commands in PRSCAL are, as far as is possible, identical to those in the PRISMA program. Therefore command procedures can be tested out before they are tried out on PRISMA itself. A particular example of this would be with the CD (Collect Data) command, where PRSCAL can be used to try out various possible sets of CD values to see which is the best or most appropriate. The PRSCAL program can also provide extra information on the configurations set up with the BR (BRagg) and CD commands which may be useful in planning or interpreting measurements. It also provides routines for calculating the resolution function in different configurations and for plotting the different measuring paths on an appropriate reciprocal space diagram. On the PRISMA microVax the program can be run in the PRSMGR and PRISMA accounts by typing: PRSCAL or PRSCALU. The situation on the ISIS Vax computers ISISE/ISVS5/etc. is that you can run either of these programs, using just the names given above if you have executed the DCL command file PRISMA-GENIE-SETUP.COM. The file sets up the various path names and symbols for PRSCAL/PRSCALU, and also for the PRSPLOT6 program and the PRISMA GENIEINIT.COM file. NTIS

N95-21232 Rutherford Appleton Lab., Oxford (England).
PRISMA OPERATING PROGRAM MANUAL
M. Hagen Aug. 1994 14 p Prepared in cooperation with Keele Univ., England
(PB95-130498; RAL-94-085) Avail: Issuing Activity (National Technical Information Service (NTIS))

The PRISMA spectrometer is controlled from the LA120 terminal in the PRISMA cabin by running a program PRISMA. If the program is not already running then it can be started by logging in to the account PRSMGR on the LA120 and typing PRISMA, at which point the prompt PRS> will appear. The program allows the user to driver (move) or scan detector/analyzer/sample angles and analyzer/detector energies and to position the spectrometer angles (16 detectors, 16 analyzers and sample) for an inelastic scattering measurement by specifying the direction of measurement in reciprocal lattice co-ordinates and the energy transfer to be measured at a specific point along the direction of the measurement. The rest of this section is divided into two sub-sections, the first describes the names used for the different angles involved in defining the spectrometer configuration. The second describes the parameters used to define (1) the motor zero and limit angles, (2) the sample, (3) the analyzer crystals and (4) the time of flight channels. The next and final section describes the control commands in the program. NTIS

COMPUTING NEAR-OPTIMAL SCHEDULES
J. K. Lenstra and D. B. Shmoys Jun. 1994 18 p Sponsored by UPS, Sun, Proctor & Gamble, DuPont, and AFOSR
(Grants NSF CCR-88-96272; NSF DMS-89-20550) (ISSN 0926-4493)
(PB95-132072; MEMO-COSOR-94-21) Avail: CASI HC A03/MF A01

We shall survey a number of results on computing near-optimal solutions for NP-hard scheduling problems. For many NP-hard optimization problems, there are polynomial-time approximation algorithms for finding solutions that are probably quite close to the optimum, whereas for others, no such algorithm is known. We will concentrate on results that state that certain performance guarantees are unlikely to be attained, in the sense that if there is such a good algorithm, then P = NP. In particular, we will survey results for multiprocessor scheduling and shop scheduling problems. NTIS

NESTLE: FEW-GROUP NEUTRON DIFFUSION EQUATION SOLVER UTILIZING THE NODAL EXPANSION METHOD FOR EIGENVALUE, ADJOINT, FIXED-SOURCE STEADY-STATE AND TRANSIENT PROBLEMS
Paul J. Turinsky, Rifat M. K. Al-Chalabi, Philippe Engrand, Hisham N. Sarsour, Francois Xaiver Faure, and Weiping Guo Jun. 1994 147 p Prepared for Los Alamos National Lab., NM
(Contracts DE-AC07-76ID-01570; W-7405-eng-36)
(DE95-001903; EGG-NRE-11406) Avail: CASI HC A07/MF A02

NESTLE is a FORTRAN77 code that solves the few-group neutron diffusion equation utilizing the Nodal Expansion Method (NEM). NESTLE can solve the eigenvalue (criticality); eigenvalue adjoint; external fixed-source steady-state; or external fixed-source, or eigenvalue initiated transient problems. The code name NESTLE originates from the multi-problem solution capability, abbreviating Nodal Eigenvalue, Steady-state, Transient, Le core Evaluator. The eigenvalue problem allows criticality searches to be completed, and the external fixed-source steady-state problem can search to achieve a specified power level. Transient problems model delayed neutrons via precursor groups. Several core properties can be input as time dependent. Two or four energy groups can be utilized, with all energy groups being thermal groups(i.e., upscatter exits) if desired. Core geometries modelled include Cartesian and Hexagonal. Three, two and one dimensional models can be utilized with various symmetries. The non-linear iterative strategy associated with the NEM method is employed. An advantage of the non-linear iterative strategy is that NESTLE can be utilized to solve either the nodal or Finite Difference Method representation of the few-group neutron diffusion equation. DOE

Advancement of computer technology is forthcoming at such a rapid pace that the research concerning the interplay of humans and computer technology is lagging far behind. One area of particular concern is the design of visual displays that are pragmatic, 'user friendly,' and 'user assisting.' When engineers design visual displays, they generally do so methodically and logically, but only from within their own individual perspective or 'model of the world.' They select the human aspects which make sense to them and not necessarily to non-engineers, operators, and others. The model design is what the engineer chooses to relate, based on his or her perspective of reality. These choices limit the model design thereby excluding the users' perspective. A set of techniques which can be used to assist the designers in expanding their choices and include the users' model is Neuro-Linguistic Programming (NLP). DOE

Almost as long as there have been user interfaces, there have been special software systems and tools to help design and implement the user interface software. Many of these tools have demonstrated significant productivity gains for programmers, and have become important commercial products. Others have proven less successful at supporting the kinds of user interfaces people want to build. This article discusses the different kinds of user interface software tools, and investigates why some approaches have worked and others have not. Many examples of commercial and research systems are included. Finally, current research directions and open issues in the field are discussed. DTIC

The objective of the study was to provide data-processing tools suitable for the construction of surface triangulations and the computation of associated discrete geometric quantities; the research performed consisted of two parts: (1) A theoretical part in which, after recalling definitions and existing results in the case of smooth and discrete surfaces, results are presented that make it possible to actually compute the Gauss curvature and the normal vector, when parameterization is available; and (2) An applied part, presenting concrete examples of applications to triangulations calculated by a parameterized mesh-generator developed for this study, and obtained by the digitization of surfaces issued from the medical world. HEURISTIC GENETIC ALGORITHMS FOR CONSTRAINED PROBLEMS. PART 1: PRINCIPLES
A. E. Eiben, P. E. Raue, and Z. Ruttkay Dec. 1993 41 p
(PB95-132031) Avail: Issuing Activity (National Technical Information Service (NTIS))

This report is an account of the theoretical issues of our research on the applicability of genetic algorithms (GA's) to solve problems where constraints are essential: constraint satisfaction problems (CSP) and constrained optimization problems (COP). We discuss the requirements and possibilities of defining so-called heuristic GA's (HGA's). Whereas in classical GA's only the selection of parents and survivors is biased by an evaluation of the candidate solutions, HGA's also apply biased choices within the child creation mechanism. This bias can be based on some, probably implicit, statistical analysis of the quality of candidate solutions, as well as on some heuristic information adopted from classical CSP solving techniques or depending on the specific problem at hand. HGA's are expected to be effective and efficient methods to solve CSP's and COP's. Test results are discussed extensively in a separate, second report in detail. In general, the test results justify the application of HGA's. Here we sum up only the main lessons learned from the experiments. Finally, we point out several open questions and further possibilities for defining non-classical GA's. NTIS

REPRESENTING MANUFACTURING FEATURES TO SUPPORT DESIGN AND PROCESS CHANGES
S. L. Brooks, W. J. Kirk, III, W. R. Simons, C. W. Brown, and R. B. Greenway, Jr. (Kansas Univ., Kansas City, KS.) Sep. 1994 8 p Presented at the Mid-America Conference on Intelligent Systems, Overland Park, KS, 27 Oct. 1994
(Contract DE-AC04-76DP-00613)
(DE94-018587; KCP-613-5496; CONF-9410197-1) Avail: CASI HC A02/MF A01

Today there exists several parametric or variational feature-based solid modeling desip tools that aid the user in productively creating a product desip. However, most of these systems do not address mapping from the desip feature to the manufacturing feature and few, if any, automaticaly link design changes to manufacturing feature and/or process changes. Currently, most systems depend on humans to detect and propagate changes. Towards solving this problem, we are working on a manufacturing feature representation that can detect a desip or process change and correct some or at a minimum flag the manufacturing engineer where the change affects manufacturing operations. We define Manufacturing Features as a collection of faces and edges. It is important that these faces and edges can be uniquely identified in the design feature representation. Each Manufacturing Feature has a Clipping Space that defines the extent of the material removal volume. Because the Clipping Space references the design feature's faces and edges we can propagate a design change. Therefore, a change in the geometry of a face or edge is propagated when the Clipping Space is reevaluated. In this paper we present this new approach for representing manufacturing features and discuss its current and planned implementation. DOE

GENERALISED APPROACH TO SOFTWARE STRUCTURE METRICS
P. M. vandenBroel and K. G. vandenBerg Apr. 1994 17 p See also PB93-223832 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB95-107561; Memo-INF-94-22) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

The aim of this paper is to generalize the Fenton-Whitty approach to structure software metrics by considering arbitrary sets of decomposition operations for flowgraphs. In the Fenton-Whitty approach decomposition of flowgraphs is unique, but the number of associated metric functions is not finite and these functions are all independent. In general, the decomposition of flowgraphs is not unique, which leads to constraints on the associated metric functions. Here we derive these constraints explicitly for two special cases, where we consider only the two operations sequencing and nesting as decomposition operations. It is shown that the two resulting classes of structure metrics are contained in the class of structure metrics of the Fenton-Whitty approach. NTIS

DESIGN AND IMPLEMENTATION OF THE FIRE ENGINE: A C++ TOOLKIT FOR FINITE AUTOMATA AND REGULAR EXPRESSIONS
Bruce W. Watson 17 May 1994 191 p
(ISSN 0926-4515)
(PB95-132924) Avail: CASI HC A09/MF A02

This paper describes the design and implementation of version 1.1 of the FIRE engine. The FIRE engine is a C++ class library implementing finite automata and regular expression algorithms. The algorithms implemented in the toolkit are almost all of those presented in the taxonomies of finite automata algorithms. The reader is assumed to be familiar with the two taxonomies and with advanced C++ programming techniques. The toolkit is implemented largely in an object-oriented style, with finite automata and regular expressions being defined as classes. All of the classes and functions in the toolkit are presented in the same format. For each class (or function) the format includes a short description of its behavior, details of its implementation, and techniques for improving its performance. NTIS

CONVERGENCE ACCELERATION OF THE PROTEUS COMPUTER CODE WITH MULTIGRID METHODS Final Report, period ending 15 Jan. 1995
A. O. Demuren and S. O. Ibraheem 15 Jan. 1995 162 p
(Grant NAG3-1329)
(NASA-CR-197677; NAS 1.26:197677) Avail: CASI HC A08/MF A02

This report presents the results of a study to implement convergence acceleration techniques based on the multigrid concept in the two-dimensional and three-dimensional versions of the Proteus computer code. The first section presents a review of the relevant literature on the implementation of the multigrid methods in computer codes for compressible flow analysis. The next two sections present detailed stability analysis of numerical schemes for solving the Euler and Navier-Stokes equations, based on conventional von Neumann analysis and the bi-grid analysis, respectively. The next section presents details of the computational method used in the Proteus computer code. Finally, the multigrid implementation and applications to several two-dimensional and three-dimensional test problems are presented. The results of the present study show that the multigrid method always leads to a reduction in the number of iterations (or time steps) required for convergence. However, there is an overhead associated with the use of multigrid acceleration. The overhead is higher in 2-D problems than in 3-D problems, thus overall multigrid savings in CPU time are in general better in the latter. Savings of about 40-50 percent are typical in 3-D problems, but they are about 20-30 percent in large 2-D problems. The present multigrid method is applicable to steady-state problems and is therefore ineffective in problems with inherently unstable solutions.

AN MCM CONCURRENT ENGINEERING SOFTWARE TOOL MARKET STUDY Final Technical Report

1994 117 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract MDA972-92-C-0022)
(AD-A279257) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This market study has been developed for the Advanced Research Projects Agency (ARPA) under the DICE program contract number MDA972-92-C-0022. This market study is focused on concurrent engineering software technology developed under the DICE program that uses the Rensellaer Object Storage Environment (ROSE). The object of this market study, based on a survey of end-user requirements, is to determine how this technology, referred to as CHOICE, could be further developed and then distributed to the commercial market. To reach our stated objective, an assessment of the current CHOICE technology, how this technology could be positioned in the commercial electronic design automation (EDA) market place, and a proposed product-market launch plan are included. OBJECT RECOGNITION BY ALIGNMENT USING INVARIANT PROJECTIONS OF PLANAR SURFACES

Kenji Nagao and Eric Grimson Dec. 1994 20 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-4038; NSF IRI-89-00276)
(AD-A279841; AI-M-1463) Avail: CASI HC A03

In order to recognize an object in an image, we must determine the best transformation from object model to the image. In this paper, we show that for features from coplanar surfaces which undergo linear transformations in space, there exist projections invariant to the surface motions up to rotations in the image field. To use this property, we propose a new alignment approach to object recognition based on centroid alignment of corresponding feature groups. This method uses only a single pair of 2D model and data. Experimental results show the robustness of the proposed method against perturbations of feature positions. DTIC

BASIC PROGRAM FOR POWER SPECTRUM ESTIMATION

E. L. Church and P. Z. Takacs May 1994 17 p
(Contract DE-AC02-76CH-00016)
(DE95-002228; BNL-49035-Rev-5/94) Avail: CASI HC A03/MF A01

A standard data set is presented to be used in testing routines that are developed for evaluating the one-dimensional periodogram spectral estimate of a series of uniformly spaced data points representing measurements of a surface profile. These data were generated using the GWBASIC program 'FFTPSD' which is included in the Appendix of this report. The original purpose of this data set was to allow us to test and debug our own periodogram estimation routines, written in various programming, languages, against a standard data set. At the request of numerous individuals, we are making it available to others who may wish to do the same. We have also included a summary explanation of periodogram estimators and the various considerations that go into generating computer algorithms for power spectrum estimation. DOE

EAGLES 1.1: A MICROCOMPUTER SOFTWARE PACKAGE FOR ANALYZING FUEL EFFICIENCY OF ELECTRIC AND GASOLINE VEHICLES

W. M. Marr 15 May 1994 8 p Presented at the Electric, Hybrid and Alternative Fuel Vehicles Conference, Aachen, Germany, 31 Oct. - 4 Nov. 1994

(Contract W-31-109-eng-38)

(DE95-001119; ANL/ES/CP-82394; CONF-9410221-1) Avail: CASI HC A02/MF A01

As part of the U.S. Department of Energy's electric/hybrid vehicle research program, Argonne National Laboratory has developed a computer software package called EAGLES. This paper describes the capability of the software and its many features and potential applications. EAGLES version 1.1 is an interactive microcomputer software package for the analysis of battery performance in electric-vehicle applications, or the estimation of fuel economy for a gasoline vehicle. The principal objective of the electric-vehicle analysis is to enable the prediction of electric-vehicle performance (e.g., vehicle range) on the basis of laboratory test data for batteries. The model provides a second-by-second simulation of battery voltage and current for any specified velocity/time or power/time profile, taking into consideration the effects of battery depth-of-discharge and regenerative braking. Alternatively, the software package can be used to determine the size of the battery needed to satisfy given vehicle mission requirements (e.g., range and driving patterns). For gasoline-vehicle analysis, an empirical model relating fuel economy, vehicle parameters, and driving-cycle characteristics is included in the software package. For both types of vehicles, effects of heating/cooling loads on vehicle performance can be simulated. The software package includes many default data sets for vehicles, driving cycles, and battery technologies. EAGLES 1.1 is written in the FORTRAN language for use on IBM-compatible microcomputers. AN EVALUATION OF THE GEAR AVERAGING SIGNAL PROCESSOR (GASP)

D. M. Blunt Sep. 1994 48 p
(DSTO-TR-0067; AR-008-933) Copyright Avail: Issuing Activity (DSTO Aeronautical and Maritime Research Lab., GPO Box 4331, Melbourne, Victoria 3001, Australia)

The Gear Averaging Signal Processor (GASP) is an IBM PC XT board designed and built by AMRL to calculate synchronous vibration signal averages in real-time. This report describes GASP at an initial stage of development in which it produces a signal averages in a non-real-time mode. To evaluate GASP in this mode of operation, a comparison was made with a PC-based signal averaging system. This comparison shows that GASP works effectively, but is limited by the memory available on the board and the precision of some of its floating point calculations. Author

THE USE OF FUZZY SET CLASSIFICATION FOR PATTERN RECOGNITION OF THE POLYGRAPH Final Report, 15 Jan. - 31 Dec. 1993

Benjamin Knapp, Mitra Dastmalchi, Eric Jacobs, and Shahab Layeghi Dec. 1993 237 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-93-1-0570)
(AD-A279148) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Polygraph tests are a widely used method to distinguish between truth and deception. Polygraph charts are usually analyzed by human interpreters. However, computer algorithms are now being developed to score the tests or verify the results. These methods are based on statistical classification techniques. In this study a number of time, frequency and correlation domain features were selected and used. The fuzzy K-nearest neighbor algorithm was used to classify the polygraph charts, a correct classification of ninety-one percent was obtained for a set of one hundred case files supplied by the NSA. USING THE CoRE REQUIREMENTS METHOD WITH ADARTS. VERSION 01.00.05

H. Lykins, R. Kirk, and D. Smith Mar. 1994 179 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract MDA972-92-J-1018)
(AD-A279151; SPC-93091-CMC) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This technical report explains how you can use the Ada-Based Design Approach for Real-Time Systems (ADARTSSM) to build a software design that satisfies software requirements specified using the Consortium Requirements Engineering Method (CoRE). ADARTS is a widely accepted object-oriented method for system and software development that results in a robust design that is well documented, meets timing requirements, can withstand change, and contains many reusable components. CoRE is a new object-oriented approach to software requirements engineering that results in requirements that are precise, testable, complete, consistent, and resilient in the face of change. This report is a supplement to the ADARTS Guidebook (Version 2) and the CoRE Guidebook (Version 1) and discusses: developing a CoRE requirements specification for use with ADARTS; deriving an ADARTS process structure from CoRE requirements; combining ADARTS processes and objects derived from CoRE requirements into an ADARTS software architecture design; and taking advantage of CoRE's precision in the ADARTS process structuring, class structuring, and software architecture design activities. VERIFICATION OF KNOWLEDGE-BASED REASONING MODULES

P. Leemans, J. Treur, and M. Willems Dec. 1993 54 p See also PB92-219575
(PB95-132692) Avail: Issuing Activity (National Technical Information Service (NTIS))

A knowledge-based system is made up out of components, and with each component goes a world description (W). Verification of a knowledge-based system is verifying each component in turn. If all components check out then the knowledge-based system has been verified. The paper introduces a number of properties that can be attributed to a knowledge base (KB) in relation to W, and are interesting for verification. Some are familiar from the literature, such as correctness, consistency, and decisiveness, but others such as completeness, and well-informedness are not often described. The authors show that the usual approach to verification is to check for special cases of these more general notions. Besides what to verify, another important topic is how to discover these potential problems. For this, a tool has been developed within the formal specification language DESIRE (a framework for DEsign and Specification of Interacting REasoning modules) for compositional architectures of knowledge-based systems. This tool DES-CHECK performs some automatic verification and fixing of the errors that are described in this paper. NTIS

FAST ALGORITHMS FOR TRANSPORT MODELS

Thomas A. Manteuffel 1994 8 p
(Contract DE-FG02-90ER-25086)
(DE95-001702; DOE/ER-25086/T2) Avail: CASI HC A02/MF A01

This project has developed a multigrid in space algorithm for the solution of the S(sub N) equations with isotropic scattering in slab geometry. The algorithm was developed for the Modified Linear Discontinuous (MLD) discretization in space which is accurate in the thick diffusion limit. It uses a red/black two-cell (mu)-line relaxation. This relaxation solves for all angles on two adjacent spatial cells simultaneously. It takes advantage of the rank-one property of the coupling between angles and can perform this inversion in O(N) operations. A version of the multigrid in space algorithm was programmed on the Thinking Machines Inc. CM-200 located at LANL. It was discovered that on the CM-200 a block Jacobi type iteration was more efficient than the block red/black iteration. Given sufficient processors all two-cell block inversions can be carried out simultaneously with a small number of parallel steps. The bottleneck is the need for sums of N values, where N is the number of discrete angles, each from a different processor. These are carried out by machine intrinsic functions and are well optimized. The overall algorithm has computational complexity O(log(M)), where M is the number of spatial cells. The algorithm is very efficient and represents the state-of-the-art for isotropic problems in slab geometry. For anisotropic scattering in slab geometry, a multilevel in angle algorithm was developed. A parallel version of the multilevel in angle algorithm has also been developed. Upon first glance, the shifted transport sweep has limited parallelism. Once the right-hand-side has been computed, the sweep is completely parallel in angle, becoming N uncoupled initial value ODE's. The author has developed a cyclic reduction algorithm that renders it parallel with complexity O(log(M)). The multilevel in angle algorithm visits log(N) levels, where shifted transport sweeps are performed. The overall complexity is O(log(N)log(M)). DOE

STANDARD DATA FORMATS FOR SIMULATION

J. Amundsen 25 Apr. 1994 16 p
(PB95-110367; STF10-A94001) Avail: Issuing Activity (National Technical Information Service (NTIS))

This report provides an overview of data formats used in computer simulation. It concentrates on, and compares, object describing formats capable of capturing both the problem data and associated methods. Although no single and obvious candidate emerges from this process, two formats separate from the others. The National Center for Supercomputer Applications (NCSA) HDF format provides a widespread, easy to implement and functionally powerful standard format for implementation, while the International Organization for Standardization (ISO) 10303 Standard for the Exchange of Product Model Data (STEP) provides a standard, relational database oriented, general problem encapsulation mechanism for cross discipline work. INITIAL EXPERIENCE WITH NONCORRECTING SYNTAX ERROR HANDLING
A. vanDeudekom, D. Grune, and P. Kooiman Nov. 1993 11 p See also PB83-107623
(PB95-132700) Avail: Issuing Activity (National Technical Information Service (NTIS))

Noncorrecting error handling is a technique which, when implemented with some caution, guarantees fully reliable syntax error messages. This paper describes a simple but efficient implementation and its incorporation in an existing top-down parser generator. Initial experience with the generated parsers is reported. Two points which require special attention are identified and discussed: handling grammars that are not completely context-free, and obtaining informative error message texts. The implementation is general enough to be incorporated in any parser generator. NTIS

A DAVIS-PUTNAM PROGRAM AND ITS APPLICATION TO FINITE-ORDER MODEL SEARCH: QUASIGROUP EXISTENCE PROBLEMS
W. McCune Sep. 1994 14 p
(Contract W-31-109-eng-38)
(DE95-003014; ANL/MCS-TM-194) Avail: CASI HC A03/MF A01

This document describes the implementation and use of a Davis-Putnam procedure for the propositional satisfiability problem. It also describes code that takes statements in first-order logic with equality and a domain size n then searches for models of size n. The first-order model-searching code transforms the statements into set of propositional clauses such that the first-order statements have a model of size n if and only if the propositional clauses are satisfiable. The propositional set is then given to the Davis-Putnam code; any propositional models that are found can be translated to models of the first-order statements. The first-order model-searching program accepts statements only in a flattened relational clause form without function symbols. Additional code was written to take input statements in the language of OTTER 3.0 and produce the flattened relational form. The program was successfully applied to several open questions on the existence of orthogonal quasigroups. DOE

STRUCTURING DESIGN REQUIREMENTS USING YMIR
F. Dikker, P. M. Wognum, L. K. Alberts, and N. J. I. Mars Jul. 1994 58 p
(PB95-132742; Memo-INF-94-41) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

The engineering design problem is to find a physically realizable description of an artifact that satisfies a given initial specification. In addition to this product-specific initial specification, many general requirements, like design codes, safety requirements and manufacturing possibilities, play a role in the design process. In this report, a conceptual model for describing these general requirements is presented. The basis of this conceptual model is a basic requirement model consisting of a scope and a restriction. The scope describes the design parts for which the requirement is applicable, the restriction describes the actual requirement. Both scope and restriction are represented on the basis of the general ontology for engineering design called YMIR. It is shown that, in this way, requirements can be used in the design process in an active way. This means that they can be incorporated in the design as soon as they become applicable and that the consequences of applicable requirements are propagated to the description of the design under construction. A general purpose ARINC (Aeronautical Radio, INC) serial interface has been developed for use with an IBM PC or compatible computer. The interface consists of a PC card and software to selectively read, log, time tag and process data read from the ARINC bus. The PC card uses an XT slot and the data is written onto floppy disk or hard disk. The data logging and post-processing software has been configured for ARINC 419/561 but can be readily reconfigured to other ARINC formats. ARINC 419/561 are low speed standards dealing with systems operating at 11 +/- 3.5 kilobits per second. The interface and PC software could readily be adapted to handle much higher speed ARINC and non-ARINC formats. Author

For today's fast-paced economy, the U.S. Army is introducing automation to replace time-consuming manual procedures. This report documents examination of potentially efficient methods for training the maintenance force at Army installation Directorates of Engineering and Housing (DEH's) or Directorates of Public Works (DPW's) in automated technology. The study examined change theory and recent views on teaching and learning, and tested the relative effectiveness of two types of instructional workbook. Each workbook provided training for the menu-based barcoding program, Automated Labor and Equipment Card Micro-Wand IIIe TM. Training based on the workbooks was offered at Fort Sam Houston and Fort Lee. At each installation one group learned from the procedural, 'step-by-step' workbook while another group used the 'whole task' scenario-based workbook. A post-training performance exercise assessed the subjects' proficiency with the Micro-Wand IIIe TM. Subjects using the scenario-based workbook performed better on the exercise than those using the procedural workbook. Problems encountered during the study are discussed, which should be helpful to project engineers and trainers involved in technology transfer. Recommendations are made on improving Micro-Wand TM software and training, barcoded service orders, and DEH/DPW's support of technology transfer of labor and equipment automation. DTIC

SCALABLE PROGRAMMING ENVIRONMENT Final Report, Sep. 1993 - Sep. 1994
Perry Partow Sep. 1994 68 p
(Proj. RJ1-4-B-41)
(AD-A286390; TR-1672) Avail: CASI HC A04/MF A01

This report describes the Scalable Programming Environment (SPE), which provides programmers with a transparent way of creating scalable parallel applications for large-grained parallel computer architectures. The SPE, which has been designed primarily to support data-flow processing applications, allows programs to be scaled to execute on any number of processing nodes while requiring no changes to the compiled binary code. The user is provided with a set of high-level message-passing routines which can be used to connect multi-instanced heterogeneous programs in a system. The SPE library routines hide the intricacies of how the parallel programs communicate. The details of the connections are specified in text files. The SPE allows individual programs to be coded without knowledge of other parts of the system and thus allows systems to be quickly built, modified, or scaled without program recompilation. DTIC

ABSTRACT INTERPRETATION OF REACTIVE SYSTEMS: ABSTRACTIONS PRESERVING UNIVERSAL CTL(*), EXISTENTIAL CTL(*) AND CTL(*)
D. Dams, O. Grumberg, and R. Gerth May 1994 36 p
(PB95-110557) Avail: CASI HC A03/MF A01

The need for formal verification of systems on one hand, and the advent of complex reactive systems on the other, calls for the development of automated verification techniques. Model checking is one such technique. The theory of abstract interpretation offers a framework for the definition and justification of property preserving abstractions. However, abstract interpretation has traditionally been focused on abstractions that preserve safety properties of programs, properties that hold in all states along every possible execution path. The authors show how it can be extended to the analysis of different kinds of reactive properties. To this purpose, they introduce two notions of abstraction of nondeterministic systems. One preserves universal computation tree logic (CTL*), the fragment of the branching time logic CTL* which allows only universal path quantification. Another preserves existential CTL*, the fragment only allowing existential path quantification. Furthermore the authors show that a combination of both notions preserves full CTL*. This brings several powerful techniques from abstract interpretation within the reach of model checking, including the construction of abstract models by symbolic execution of programs and the use of approximations to find an optimum between precision and speed. Examples are given to illustrate these. NTIS

FORMAL SPECIFICATION AND COMPOSITIONAL VERIFICATION OF AN ATOMIC BROADCAST PROTOCOL
P. Zhou and J. Hooman 26 Jan. 1994 33 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB95-110508) Avail: CASI HC A03

We apply formal methods to specify and verify an atomic broadcast protocol. The protocol is implemented by replicating a server process on all processors in a network. We show that the verification of the protocol can be done compositionally by using specifications in which timing is expressed by local clock values. The requirements of the protocol are formally described, underlying communication mechanism, clock synchronization assumption, and failure assumptions are axiomatized. The server process is also represented by a formal specification. We verify that parallel execution of the server processes leads to the desired properties, by proving that the conjunction of all server specifications and axioms about the system implies the requirements of the protocol. FEATURE EXTRACTION WITHOUT EDGE DETECTION
Ronald D. Chaney Sep. 1993 154 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-92-J-1879)
(AD-A279842; AI-TR-1434) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Information representation is a critical issue in machine vision. The representation strategy in the primitive stages of a vision system has enormous implications for the performance in subsequent stages. Existing feature extraction paradigms, like edge detection, provide sparse and unreliable representations of the image information. In this thesis, we propose a novel feature extraction paradigm. The features consist of salient, simple parts of regions bounded by zero-crossings. The features are dense, stable, and robust. The primary advantage of the features is that they have abstract geometric attributes pertaining to their size and shape. To demonstrate the utility of the feature extraction paradigm, we apply it to passive navigation. We argue that the paradigm is applicable to other early vision problems. DTIC

Design replay presents a possible enabling technology to the Knowledge-Based Software Assistant specification maintenance and implementation derivation approach to software development. More generally, design replay can also be applied to derivations between a variety of different software description abstraction levels. Radical changes to a software artifact cannot generally be addressed by design replay as they require new design output. Evolutionary changes are more amenable to design replay and often involve incremental changes to derived artifacts. This report describes an approach to rederivation that exploits the incrementality of evolutionary maintenance changes, the state of MITRE's implementation of this approach, and what remains to be done to test this approach. SADDLE-NODE DYNAMICS FOR EDGE DETECTION
Y. F. Wong Sep. 1994 9 p Presented at the IEEE Workshop on Neural Networks for Signal Processing, Ermioni, Greece, 6-8 Sep. 1994
(Contract W-7405-eng-48)
(DE94-017415; UCRL-JC-116635; CONF-9409192-1) Avail: CASI HC A02/MF A01

The author demonstrates how the formulation of a nonlinear scale-space filter can be used for edge detection and junction analysis. By casting edge-preserving filtering in terms of maximizing information content subject to an average cost function, the computed cost at each pixel location becomes a local measure of edgeness. This computation depends on a single scale parameter and the given image data. Unlike previous approaches which require careful tuning of the filter kernels for various types of edges, this scheme is general enough to be able to handle different edges, such as lines, step edges, corners and junctions. Anisotropy in the data is handled automatically by the nonlinear dynamics. DOE

Applications which run on parallel supercomputers are often characterized by massive datasets. Converting these vast collections of numbers to visual form has proven to be a powerful aid to comprehension. For a variety of reasons, it may be desirable to provide this visual feedback at runtime. One way to accomplish this is to exploit the available parallelism to perform graphics operations in place. In order to do this, we need appropriate parallel rendering algorithms and library interfaces. This paper provides a tutorial introduction to some of the issues which arise in designing parallel graphics libraries and their underlying rendering algorithms. The focus is on polygon rendering for distributed memory message-passing systems. We illustrate our discussion with examples from PGL, a parallel graphics library which has been developed on the Intel family of parallel systems. DTIC

ILIAS: A SEQUENTIAL LANGUAGE FOR PARALLEL MATRIX COMPUTATIONS
L. D. J. C. Loyens (Koninklijke/Shell-Lab., Amsterdam, Netherlands.) and J. Moonen Oct. 1993 29 p
(PB95-110631) Avail: CASI HC A03/MF A01

The ILIAS system consists of a sequential language for matrix computations, a compiler translating a source program into ILIAS pseudo code and a parallel interpreter for this code. The pseudo code is independent of a target architecture; it merely specifies scalar and matrix computations. The authors present the ILIAS language and discuss its implementation on a square torus network of transputers. Subscription of matrices causes data-alignment problems, which are solved by redistributions. To reduce redistribution overhead the authors use a new data distribution called the grid-base distribution. Furthermore, they develop several run-time heuristics that, together with the grid-base distribution, efficiently implement matrix subscription. The feasibility and scalability of the ILIAS system is demonstrated by timing results for two example ILIAS programs, an LU decomposition and a Strassen matrix multiplication, on transputer networks up to 400 processors. SPLIT-C AND ACTIVE MESSAGES UNDER SUNMOS ON THE INTEL PARAGON
Rolf Reisen and Arthur B. Maccabe (New Mexico Univ., Albuquerque, NM.) Apr. 1994 10 p Presented at the Supercomputing 1994 Meeting, Washington, DC, 14-18 Nov. 1994
(Contract DE-AC04-94AL-85000)
(DE94-011418; SAND-94-1228C; CONF-941118-2) Avail: CASI HC A02/MF A01

The compute power of the individual nodes of massively parallel systems increases steadily, while network latencies and bandwidth have not improved as quickly. Many researches believe that it is necessary to use explicit message passing in order to get the best possible performance out of these systems. High level parallel languages are shunned out of fear they might compromise performance. In this paper we have a look at one such language called Split-C. It fits into a middle ground between efforts such as High Performance Fortran (HPF) and explicit message passing. HPF tries to hide the underlying architecture from the programmer and let the compiler and the run time system make decision about parallelization, location of data, and the mechanisms used to transfer the data from one node to another. On the other hand, explicit message passing leaves all the decision to the programmer. Split-C allows access to a global address space, but leaves the programmer in control of the location of data, and offers a clear cost model for data access. Split-C is based on Active Messages. We have implemented both under the SUNMOS operating system on the Intel Paragon. We will discuss performance issues of Split-C and make direct comparisons to the Thinking Machines CM-5 implementation. We will also scrutinize Active Messages, discuss their properties and drawbacks, and show that other mechanisms can be used to support Split-C. DOE

PERFORMANCE ISSUES FOR ENGINEERING ANALYSIS ON MIMD PARALLEL COMPUTERS
H. E. Fang, C. T. Vaughan, and D. R. Gardner 1994 8 p Presented at the American Society of Mechanical Engineers' Winter Annual Meeting, Chicago, IL, 9-11 Nov. 1994
(Contract DE-AC04-94AL-85000)
(DE94-015769; SAND-94-0985C; CONF-941142-17) Avail: CASI HC A02/MF A01

We discuss how engineering analysts can obtain greater computational resolution in a more timely manner from applications codes running on MIMD parallel computers. Both processor speed and memory capacity are important to achieving better performance than a serial vector supercomputer. To obtain good performance, a parallel applications code must be scalable. In addition, the aspect ratios of the subdomains in the decomposition of the simulation domain onto the parallel computer should be of order 1. We demonstrate these conclusions using simulations conducted with the PCTH shock wave physics code running on a Cray Y-MP, a 1024-node nCUBE 2, and an 1840-node Paragon. DOE

PARALLEL SOLID MECHANICS CODES AT SANDIA NATIONAL LABORATORIES
M. McGlaun 1994 6 p Presented at the American Society of Mechanical Engineers' Winter Annual Meeting, Chicago, IL, 9-11 Nov. 1994
(Contract DE-AC04-94AL-85000)
(DE94-015770; SAND-94-1925C; CONF-941142-13) Avail: CASI HC A02/MF A01

Computational physicists at Sandia National Laboratories have moved their production codes to distributed memory parallel computers. The codes include the multi-material CTH Eulerian code, structural mechanics code. This presentation discusses our experiences moving the codes to parallel computers and experiences running the codes. Moving large production codes onto parallel computers require developing parallel algorithms, parallel data bases and parallel support tools. We rewrote the Eulerian CTH code for parallel computers. We were able to move both ALEGRA and PRONTO to parallel computers with only a modest number of modifications. We restructured the restart and graphics data bases to make them parallel and minimize the I/O to the parallel computer. We developed mesh decomposition tools to divide a rectangular or arbitrary connectivity mesh into sub-meshes. The sub-meshes map to processors and minimize the communication between processors. We developed new visualization tools to process the very large, parallel data bases. This presentation also discusses our experiences running these codes on Sandia's 1840 compute node Intel Paragon, 1024 processor nCUBE and networked workstations. The parallel version of CTH uses the Paragon and nCUBE for production calculations. The ALEGRA and PRONTO codes are moving off networked workstations onto the Paragon and nCUBE massively parallel computers. DOE

SYSTEM LEVEL FAULT TOLERANCE IN PARALLEL AND DISTRIBUTED COMPUTING SYSTEMS Final Report, 1 Jul. 1988 - 31 Dec. 1993
31 Dec. 1993 15 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-88-K-0543)
(AD-A279664) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The major thrust of our effort was focused on the theory and practice of responsive (fault-tolerant, real-time) computing in parallel and distributed processing environments. New efficient methods of system testing have been developed which shorten a multiprocessor testing time by orders of magnitude and, therefore, can be used at system booting (previous techniques were prohibitively long). A new design framework for responsive computing was designed and is being implemented for validation. This framework is based on consensus which can be used to provide synchronization, reliable communication, fault diagnosis, checkpointing and even scheduling in multiprocessor environments. We have formalized and quantified the space-time tradeoff for efficient fault recovery. The system model is a graph, and we were especially successful in analysis of meshes and hypercubes. We developed a new method called naturally redundant algorithms which allows efficient implementation of application-specific techniques. DTIC

A SCALABLE VIDEO RATE CAMERA INTERFACE
Jon A. Webb, Thomas Warfel, and Sing B. Kang 26 Sep. 1994 15 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F19628-93-C-0171; ARPA Order A655)
(AD-A286144; CMU-CS-94-192) Avail: CASI HC A03

We survey the state of the art in high-speed interfaces for video input to high performance computers and note the difficulty of providing video at rates appropriate to modern parallel computers. Most interfaces that have been developed to date are not scalable, required extensive hardware development, and impose a full frame time delay between the moment the camera captures video and the moment it is available for processing. We propose a solution, based on a simple interface we have developed, which has been integrated into the iWarp parallel computer developed by Carnegie Mellon University and Intel Corporation. The interface takes advantage of iWarp's systolic capabilities, does not impose any frame buffer delay time, was simple to design, and is readily scalable to provide up to 32 camera ports, from all of which data can be captured at full video rate, on a system that fits in a 19 inch 6U rack. We have applied the system to multibaseline stereo vision, and provide performance figures. DTIC

A THEORETICAL STUDY ON THE PERFORMANCE OF THE FDTD CODE ON A MASSIVELY PARALLEL COMPUTER
M. G. Brand and L. J. VanEwijk 1 Apr. 1994 31 p
(AD-A285346; FEL-93-B366; TDCK-94-0166) Avail: CASI HC A03/MF A01

In this report we present a theoretical study on the performance of an implementation of the FDTD code on a massively parallel computer. The finite difference time domain (FDTD) method is one of the most popular approaches for the numerical modelling of a wide variety of electromagnetic wave interaction problems. The analysis presented is carried out for radar cross section (RCS) prediction but can, with minor adaptations, be used for other electromagnetic problems. The analysis is applied to a possible implementation on the parsytec GCEL-3/512 of the 'Interdisciplinary Center for Computer Based Complex Systems Research Amsterdam (IC3A)', which is configured as a two-dimensional grid of 512 T805 transputers. Comparisons with the performance of an implementation on a conventional supercomputer, the convex C230 of the physics and electronics laboratory TNO, are presented. DTIC

Many important applications have a heterogeneous structure, and can be implemented efficiently only with task parallelism. This paper presents a set of extensions to Fortran to build task parallel programs for multicomputers consisting of distinct nodes: either private memory parallel machines, or autonomous computers connected by a high speed network. The design of these extensions is driven by the following objectives: (1) The compiler should handle inter-node communication, not the programmer; (2) The task extensions should be integrated into an existing parallel programming language, so that existing programs can benefit from task parallelism, existing libraries can be used, and the users do not have to learn a new language; and (3) Current compiler technology should be able to produce efficient parallel programs that are competitive with hand parallelized codes. STOCHASTIC NETWORK PROCESSES Final Technical Report, 1 Nov. 1990 - 31 Oct. 1993
Richard F. Serfozo 31 Oct. 1993 6 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0013-91)
(AD-A279905; AFOSR-94-0309TR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The general theme of the research has been to develop stochastic network processes for modeling the movement of discrete units in networks. Primary examples are the movement of parts and supplies in manufacturing plants and in distribution systems and the movement of data packets and telephone calls in computer and telecommunications networks. The distinguishing feature of the research is the emphasis on the next generation of intelligent networks that will be the backbone of the manufacturing and computer systems. In these networks, the processing of units at the nodes and the routing of units typically depend dynamically on the actual network congestion, and units move concurrently (e.g. batch processing) most of the present theory of stochastic network processes is for unintelligent networks in which the nodes operate independently, the routes of units are independent, and the units move one-at-a-time. The goal is to provide an understanding of these more complex intelligent networks by describing their stochastic behavior. DTIC

(Contract DE-FG02-86ER-25012)
(DE95-002805; DOE/ER-25012/5) Avail: CASI HC A03/MF A01

For years (about 20, in fact) dataflow researchers have argued for the use of dataflow (a subset of functional) languages for parallel computing, resting their proof on the ability to construct large-scale dataflow machines to realize the inherent parallelism in Functional programs. Unfortunately, such machines have never materialized as commercial products - instead, the market shows a vast variety of parallel multiprocessors that require special skills to program. It may be the case that these machines reflect a wrong direction in computer architecture design, and it may be the case that dataflow machines are the right way to go, but the proof is in the pudding, and thus far there does not exist even a prototype dataflow machine that can prove the 'dataflow thesis'. Under the circumstances it would seem rather foolhardy simply to ignore the commercial parallel machines that are available now, regardless of one's favorite programming methodology or concurrency model. It has been the authors' thesis that one can in fact use such machines effectively, while maintaining the concomitant thesis that functional programming is good for parallel computation. During the last two years the author has made considerable progress to support this two-fold thesis, and is now prepared to extend this work in several ways. The authors' particular interest, and presumably the primary interest to DOE, is to concentrate the work in the area of scientific computing, including functional language features, program development tools, and systems support tailored for scientific computing applications. The authors' desire to do this reflects confidence that this approach really will work for scientific computing - the author has spent two years proving the viability of the ideas, and now it's time to put them into action. DOE

A DIVIDE-AND-CONQUER METHOD FOR TRIDIAGONALIZING SYMMETRIC MATRICES WITH REPEATED EIGENVALUES
Christina H. Bischof and Xiaobai Sun 1994 13 p
(Contract W-31-109-eng-38)
(DE95-002918; ANL/MCS/PP-75731) Avail: CASI HC A03/MF A01

The authors describe a divide-and-conquer tridiagonalization approach for matrices with repeated eigenvalues. The algorithm hinges on the fact that, loosely speaking, a symmetric matrix with bandwidth b and k distinct eigenvalues must be block diagonal with diagonal blocks of size at most bk. A slight modification of the usual orthogonal bandreduction algorithm allows them to reveal this structure, which then leads to parallelism in the form of independent diagonal blocks. Compared to the usual Householder reduction algorithm, the approach allows significantly more scope for the exploitation of parallelism and can reduce the number of floating-point operations by up to 50%. The actual savings depend very much on the number of distinct eigenvalues, but at worst it behaves exactly like the usual tridiagonalization procedure. They also mention how the resulting tridiagonal structure can be employed very advantageously in determining range and nullspaces of symmetric matrices with two distinct eigenvalues, one of which is zero. NON-INTRUSIVE SCSI STATUS SENSING SYSTEM Patent Application
Stephen J. Amuro, inventor (to Navy) and Paul J. Giorgio, inventor (to Navy) 29 Mar. 1994 26 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-D016242; US-Patent-Appl-SN-219553) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

An improved Small Computer System Interface (SCSI) controller provides a logical connection between a plurality of host processors using a single SCSI initiator. The controller contains removable host adapters for connection to any type of host processor interface'. When a host processor requests status information of a target device, that status information is passed to the requesting processor and subsequently stored in the controller and made available to all other host processors. In addition, a fault tolerant performance monitoring algorithm, executing within the controller, is scheduled to non-intrusively and periodically check the status of each SCSI target device and to store that status information for all host processors. The advantage to such a controller is that by using a single SCSI initiator, each host processor can independently and logically connect through the controller and SCSI initiator to a target without clearing target status information for other host processors. This is particularly advantageous when adapted to function on a local area network (LAN) arrangement wherein a significant number of host processors are requesting data. DTIC

HPCC TECHNOLOGY AWARENESS PROGRAM: IMPROVED ECONOMIC COMPETITIVENESS THROUGH TECHNOLOGY AWARENESS, TRANSFER AND APPLICATION
Apr. 1994 104 p
(Contract DE-FG03-93ER-25149)
(DE95-002134; DOE/ER-25149/T1) Avail: CASI HC A06/MF A02

A need has been defined by Congress for the DOE National Laboratories to participate in various dual use and technology transfer programs. This requirement has spawned several technology transfer approaches at the DOE laboratories. These programs are designed to encourage large and small business to bring their problems and needs forward, and to allow the labs to transfer effective high performance computing technology to the commercial marketplace. This IG Technologies grant from the DOE was undertaken to address the issues and problems associated with technology transfer between the DOE National Laboratories and commercial industry. The key focus is to gain an understanding of how DOE and industry independently and collectively view the requirements and the missing elements that could allow DOE to facilitate HPCC technology transfer. At issue is HPCC Technology Transfer for the High Performance Computing industry and its relationship to the DOE National Laboratories. Several observations on this are addressed. The issue of a 'Technology Utilization Gap' between the National Laboratories and Independent Software Vendors is discussed. This study addressed the HPCC Technology Transfer plans of all six DOE National Labs. Study team members briefed numerous industrial users of HPCC technology as to the feasibility of technology transfer for various applications. Significant findings of the effort are that the resistance to technology transfer is much higher than anticipated for both the National Labs and industry. Also, HPCC Technology Transfer is observed to be a large company's dominion. Small businesses have a difficult time in addressing the requirements of technology transfer using Cooperative Research and Development Agreements (CRADA's). Large businesses and the DOE National Labs however, often have requirements and objectives which are at cross purposes, making effective technology transfer difficult. DOE

A SIMULATION STUDY OF TCP PERFORMANCE IN ATM NETWORKS
Chien Fang, Helen Chen, and J. Hutchins 1994 7 p Presented at the GLOBECOM 1994, San Francisco, CA, 27 Nov. - 1 Dec. 1994
(Contract DE-AC04-76DR-00789)
(DE94-016622; SAND-94-8728C; CONF-9411102-1) Avail: CASI HC A02/MF A01

This paper presents a simulation study of TCP performance over congested asynchronous transfer mode (ATM) local area networks (LAN's). We simulated a variety of schemes for congestion control for ATM LAN's, including a simple cell-drop, a credit-based flow control scheme that back-pressures individual virtual circuits (VC's), and two selective cell-drop schemes. Our simulation results for congested ATM LAN's show the following: (1) TCP performance is poor under simple cell-drop, (2) the selective cell-drop schemes increase effective link utilization and result in higher TCP throughputs than the simple cell-drop scheme, and (3) the credit-based flow control scheme eliminates cell loss and achieves maximum performance and effective link utilization. (Contract DE-AC05-84OR-21400)
(DE94-019115; CONF-9310161-2) Avail: CASI HC A03/MF A01

PVM (Parallel Virtual Machine) is a byproduct of the heterogeneous network research project going on at Oak Ridge National Laboratory and the University of Tennessee. It is a software package that permits a user defined collection of serial, parallel, and vector computers to appear as one large distributed memory computer. PVM's popularity is quickly making it the worldwide de facto standard for distributed computing. Applications, which can be written in FORTRAN or C, can be parallelized by using simple message-passing constructs common to most distributed-memory computers. By sending and receiving messages, subtasks of an application can cooperative to solve a problem in parallel. This paper describes the features of the latest release of PVM (version 3.1) and explains the major new research areas they are beginning to explore in heterogeneous network computing. The new features of PVM version 3 open many new opportunities to go beyond simple network computing, but several technical and social issues must be addressed before one can make the next big leap in distributed computing. DONIO: DISTRIBUTED OBJECT NETWORK I/O LIBRARY
E. F. DAzevedo and C. H. Romine Sep. 1994 39 p
(Contract DE-AC05-84OR-21400)
(DE94-019163; ORNL/TM-12743) Avail: CASI HC A03/MF A01

This report describes the use and implementation of DONIO (Distributed Object Network I/O), a library of routines that provide fast file I/O capabilities in the Intel iPSC/860 and Paragon distributed memory parallel environments. DONIO caches a copy of the file in memory distributed across all processors. Disk I/O routines (such as read, write, and lseek) are replaced by calls to DONIO routines, which translate these operations into message communication to update the cached data. Experiments on the Intel Paragon show that the cost of concurrent disk I/O using DONIO for large files can be 15-30 times smaller than using standard disk I/O. DOE

The objective of this research is to assess the value of different usability methods to designing a system as complex as a programming environment for a knowledge-based architecture that learns. As well as traditional empirical methods observing real users, analytic and heuristic methods to assess the usability of complex computer systems in advance of running prototypes are emerging from human-computer interaction (HCI) research. We will demonstrate the effectiveness of these observational, analytic and heuristic usability methods with respect to: (1) The classes of knowledge-based systems to which they can be applied; (2) The types of usability problems they can, and cannot identify; (3) The types of suggestions they can generate for the design of improved knowledge-based systems and the relative value of those suggestions for overall usability of the systems; (4) The expertise of the evaluators necessary to apply the methods; and (5) The effort involved in applying the methods. A MASSIVELY PARALLEL ALGORITHM FOR GRAND CANONICAL MONTE CARLO COMPUTER SIMULATION WITH THE SHORT-RANGED LENNARD-JONES POTENTIAL
Grant S. Heffelfinger and Martin E. Lewitt (nCUBE Corp., Sandia Park, NM.) 1994 17 p Presented at the Supercomputing 1994 Meeting, Washington, DC, 14-18 Nov. 1994
(Contract DE-AC04-94AL-85000)
(DE94-010396; SAND-94-0989C; CONF-941118-1) Avail: CASI HC A03/MF A01

We present a new massively parallel decomposition for grand canonical Monte Carlo computer simulation (GCMC) suitable for short ranged fluids. Our spatial algorithm relies on the fact that for short-ranged fluids, molecules separated by a greater distance than the reach of the potential act independently, thus different processors can work concurrently in regions of the same system which are sufficiently far apart. Several parallelization issues unique to GCMC are addressed such as the handling of the three different types of Monte Carlo move used in GCMC: the displacement of a molecule, the creation of a molecule, and the destruction of a molecule. The decomposition is shown to scale with system size, making it especially useful for systems where the physical problem dictates the system size, for example, fluid behavior in mesopores. DOE

The paper addresses the subject of linking functional specifications to performance analysis in a process algebraic context. It presents a timed, probabilistic extension of a process algebraic formalism and its application to performance analysis. More specifically, an extension of a subset of LOTOS is presented equipped with a truly concurrent semantical model based on bundel event structures. It is investigated how semi-Markov chains can be obtained from functional specifications using this semantical model. The use of a true concurrency model enables us to distinguish between non-determinism and parallelism, to reduce the state explosion problem and, moreover, to analyze part of the system without considering other (irrelevant) parts. An example illustrates the proposed approach. NTIS

STATUS OF CFDLIB PERFORMANCE TESTS ON THE T3D
Nely T. Padial, Bryan A. Kashiwa, and Douglas B. Kothe 1994 11 p Presented at the Cray User's Group Conference, Tours, France, 10-14 Oct. 1994 Sponsored by DOD, Amoco Oil Co., and Molten Metal Technology, Inc.
(Contract W-7405-eng-36)
(DE95-002708; LA-UR-94-3449; CONF-9410212-3) Avail: CASI HC A03/MF A01

Computational Fluid Dynamics LIBrary (CFDLIB) is a collection of two and three-dimensional computer codes for problems in computational fluid dynamics. The library handles a wide range of flow regimes both single and multiphase, from fully incompressible to hypersonic, chemically reacting or inert materials. The method uses the Implicity Continuous-fluid Eulerian scheme (ICE) which becomes essentially identical to the Marker and Cell (MAC) method in the incompressible limit. The method, a Finite-Volume scheme, with cell-centered state variables, utilizes an Arbitrary-Lagrangian-Eulerian (ALE) split computational cycle in the sense that the mesh is allowed to move in an arbitrary fashion. In addition, CFDLIB employs a multiblock data structure that proved extremely convenient for implementation on parallel computers. CFDLIB is now available in sequential or parallel environments, is written in standard FORTRAN 77, and is highly portable. Results are given for a selection of specialized applications that illustrate the kind of problems of interest to CFDLIB users. Finally, initial results are given for performance studies comparing the Cray Y-MP, T3D, and an IBM workstation cluster. For certain problems, a Y-MP-equivalent real solution time is achieved with less than eight processors on the T3D. DOE

METHOD OF SENSING TARGET STATUS IN A LOCAL AREA NETWORK Patent Application
Stephen J. Amuro, inventor (to Navy) and Paul J. Giorgio, inventor (to Navy) 29 Mar. 1994 29 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-D016248; US-Patent-Appl-SN-219555) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

A Small Computer System Interface (SCSI) controller adapted as a network file server provides a virtual connection between a plurality of host processors and a single SCSI initiator. The controller contains a removable host adapter for connection to any type of network interface. When a host processor issues a command packet and requests status information of a target device, that status information is passed to the requesting processor and subsequently stored in the controller and made available to all other host processors on the network. A fault tolerant performance monitoring algorithm, executing within the controller, is scheduled to non-intrusively and periodically check the status of each SCSI target device and to store that status information for all host processors. The advantage to such a controller is the expanded number of host processor connections to a single SCSI initiator whereby each host processor can independently and logically connect through the controller and SCSI initiator to a target without clearing target status information for other host processors. The Research Institute for Advanced Computer Science (RIACS) was established by the Universities Space Research Association (USRA) at the NASA Ames Research Center (ARC) on June 6, 1983. RIACS is privately operated by USRA, a consortium of universities with research programs in the aerospace sciences, under contract with NASA. The primary mission of RIACS is to provide research and expertise in computer science and scientific computing to support the scientific missions of NASA ARC. The research carried out at RIACS must change its emphasis from year to year in response to NASA ARC's changing needs and technological opportunities. Research at RIACS is currently being done in the following areas: (1) parallel computing; (2) advanced methods for scientific computing; (3) high performance networks; and (4) learning systems. RIACS technical reports are usually preprints of manuscripts that have been submitted to research journals or conference proceedings. A list of these reports for the period January 1, 1994 through December 31, 1994 is in the Reports and Abstracts section of this report. Author

METHOD OF NON-INTRUSIVELY SENSING STATUS IN A COMPUTER PERIPHERAL Patent Application
Stephen J. Amuro, inventor (to Navy) and Paul J. Giorgio, inventor (to Navy) 29 Mar. 1994 26 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-D016241; US-Patent-Appl-SN-219557) Avail: CASI HC A03

An improved method of having a Small Computer System Interface (SCSI) controller provide a logical connection between a plurality of host processors using a single SCSI initiator. The controller contains removable host adapters for connection to any type of host processor interface. When a host processor requests status information of a target device, that status information is passed to the requesting processor and subsequently stored in the controller and made available to all other host processors. In addition, a fault tolerant performance monitoring algorithm, executing within the controller is scheduled to non-intrusively and periodically check the status of each SCSI target device and to store that status information for all host processors. The advantage to such a controller is that by using only a single SCSI initiator, each host processor can independently and logically connect through the controller and SCSI initiator to a target without clearing target status information for other host processors. This is particularly advantageous when adapted to function in a local area network (LAN) arrangement wherein a significant number of host processors are requesting data. DTIC

NETWORK DISTRIBUTED GLOBAL MEMORY FOR TRANSPARENT MESSAGE PASSING ON DISTRIBUTED NETWORKS Progress Report, 1 Nov. 1993 - 7 Mar. 1994
Jerry A. Clarke Oct. 1994 23 p
(Contract DAAL03-89-7C-0088)
(AD-A286096; ARL-CR-173) Avail: CASI HC A03/MF A01

Distributing compute-intensive applications across multiple platforms can significantly reduce the total execution time of the application. Programming such a system typically involves sending explicit messages between cooperating processes. Keeping track of these messages, however, can be a difficult, error-prone task. Shared memory models are typically easier to program. Network Distributed Global Memory (NDGM) allows the programmer to view the physically distributed environment as a single, contiguous address space. Instead of sending an explicit message to another node, processes write and read from a global block of memory. DTIC

COMPARISON OF A BACK PROPAGATION ARTIFICIAL NEURAL NETWORK MODEL WITH A LINEAR REGRESSION MODEL FOR PERSONNEL SELECTION Interim Report, 1 Oct. 1990 - 30 Sep. 1991
C. A. Wilkins and W. A. Sands May 1994 16 p
(AD-A280023; NPRDC-TN-94-18) Avail: CASI HC A03/MF A01

This exploratory research examined the usefulness of an Artificial Neural Network-Back Propagation (ANN-BP) model predicting dichotomous criteria in personnel selection. The results are quite encouraging. Under a wide variety of circumstances, the ANN-BP model was superior to the Ordinary Least-Squares-Linear Regression (OLS-LR) model in predicting curvilinear relationships. When the underlying relationship was linear, there were no significant differences. This is somewhat remarkable, given that the OLS-LR model was designed to perform optimally in the linear case. An abstract framework for the analysis and approximation of a class of nonlinear optimal control and optimization problems is constructed. Nonlinearities occur in both the objective functional and in the constraints. The framework includes an abstract nonlinear optimization problem posed on infinite dimensional spaces, and approximate problem posed on finite dimensional spaces, together with a number of hypotheses concerning the two problems. The framework is used to show that optimal solutions exist, to show that Lagrange multipliers may be used to enforce the constraints, to derive an optimality system from which optimal states and controls may be deduced, and to derive existence results and error estimates for solutions of the approximate problem. The abstract framework and the results derived from that framework are then applied to three concrete control or optimization problems and their approximation by finite element methods. The first involves the von Karman plate equations of nonlinear elasticity, the second, the Ginzburg-Landau equations of superconductivity, and the third, the Navier-Stokes equations for incompressible, viscous flows. ROBUST AGENT CONTROL OF AN AUTONOMOUS ROBOT WITH MANY SENSORS AND ACTUATORS
Cynthia Ferrell May 1993 167 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-4038)
(AD-A280148; MIT-TR-1443) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This thesis presents methods for implementing robust hexpod locomotion on an autonomous robot with many sensors and actuators. The controller is based on the Subsumption Architecture and is fully distributed over approximately 1500 simple, concurrent processes. The robot, Hannibal, weighs approximately 6 pounds and is equipped with over 100 physical sensors, 19 degrees of freedom, and 8 on board computers. We investigate the following topics in depth: distributed control of a complex robot, insect-inspired locomotion control for gait generation and rough terrain mobility, and fault tolerance. The controller was implemented, debugged, and tested on Hannibal. Through a series of experiments, we examined Hannibal's gait generation, rough terrain locomotion, and fault tolerance performance. These results demonstrate that Hannibal exhibits robust, flexible, real-time locomotion over a variety of terrain and tolerates a multitude of hardware failures. DTIC

FAULT TOLERANCE OF NEURAL NETWORKS Final Technical Report, Feb. 1992 - Aug. 1993
Jul. 1994 108 p
(Contract F30602-92-C-0031; AF Proj. 2338)
(AD-A285098; RL-TR-94-93) Avail: CASI HC A06/MF A02

This effort studied fault tolerance aspects of artificial neural networks, and resulted in the development of neural learning techniques that more effectively utilize the inherent redundancy and excess of resources over the minimum required found in most classically trained networks. Performance evaluation measures were developed and used to quantify network tolerance to faults such as single link failures, multiple node failures, multiple link failures, and also small degradations in multiple links or nodes. Several variations of the basic back-propagation algorithm were designed and implemented, yielding improvements in fault tolerance. An Addition-Deletion algorithm was designed to successively modify the size of a network by deleting nodes that do not contribute to fault tolerance, and to add new nodes in a way that is assured to improve fault tolerance. The techniques designed in this project were compared to those suggested by others, and were found to improve robustness. Also, a Refine algorithm was defined, which takes a robust network which does not satisfy hardware restrictions and transforms it to another network which does. DTIC

BIOLOGICAL AND THEORETICAL STUDIES OF ADAPTIVE NETWORKS: THE CONDITIONED RESPONSE Final Technical Report, 1 Aug. 1992 - 31 Jul. 1994
John W. Moore 30 Aug. 1994 15 p
(Contract F49620-92-J-0387)
(AD-A284781; AFOSR-94-0576TR) Avail: CASI HC A03/MF A01

Investigations of adaptive neural networks were conducted using the classically conditioned eyeblink of rabbit, a widely used model system for studies of learning and memory. Our work has focused on processes that mediate adaptive timing of conditioned responses, an important question in the field of learning and motor control. The following experimental projects were conducted: (1) a recording study of the medial geniculate neurons during two-tone differential trace conditioning; (2) a recording study of the ventrolateral pontine reticular formation and pontine nuclei during two-tone differential conditioning; (3) anatomical experiments using WGA-HRP that clarify cerebellar and red nucleus circuits involved in eyeblink conditioning; (4) behavioral experiments examining the role of temporal uncertainty in conditioned response timing and topography; and (5) behavioral experiments on asynchronous bilateral eyelid conditioning in rabbits. A-POSTERIORI ESTIMATION AND ADAPTIVE CONTROL OF THE POLLUTION-ERROR IN THE h-VERSION OF THE FINITE ELEMENT METHOD
I. Babuska, T. Strouboulis (Texas A&M Univ., College Station, TX.), C. S. Upadhyay (Texas A&M Univ., College Station, TX.), and S. K. Gangaraj (Texas A&M Univ., College Station, TX.) Aug. 1994 56 p
(Contract N00014-90-J-1030; NSF CCR-88-20279; NSF MSS-90-25110)
(AD-A285670; TN-BN-1175) Avail: CASI HC A04/MF A01

We studied the pollution-error in the h-version of the finite element method and its effect on the quality of the local error indicators (resp. the quality of the derivatives recovered by local postprocessing) in the interior of the mesh. Here we show that it is possible to construct a-posteriori estimates of the pollution-error in a patch of elements by employing the local error indicators over the entire mesh. We also give an adaptive algorithm for the local control of the pollution-error in a patch of elements of interest. DTIC

ANALYTIC PERTURBATION ANALYSIS OF DISCRETE EVENT DYNAMIC SYSTEMS
S. Uryasev 1994 6 p Presented at the 1994 International Conference on Computer Integrated Manufacturing and Automation Technology, Troy, NY, 10 Oct. 1994
(Contract DE-AC02-76CH-00016)
(DE94-018635; BNL-60747; CONF-9410167-2) Avail: CASI HC A02/MF A01

This paper considers a new analytic perturbation analysis (APA) approach for discrete event dynamic systems (DEDS) with discontinuous sample-path functions with respect to control parameters. The performance functions for DEDS usually are formulated as mathematical expectations, which can be calculated only numerically. APA is based on new analytic formulas for the gradients of expectations of indicator functions; therefore, it is called an analytic perturbation analysis. The gradient of performance function may not coincide with the expectation of a gradient of sample-path function (i.e., the interchange formula for the gradient and expectation sign may not be valid). Estimates of gradients can be obtained with one simulation run of the models. DOE

OPTIMAL DISTRIBUTED CONTROL SYSTEM FOR A LINEAR DISTRIBUTED PARAMETER SYSTEM Patent
Allen Moshfegh, inventor (to Navy) 12 Jul. 1994 34 p Filed 29 Aug. 1991
(AD-D016583; US-Patent-5,329,442; US-Patent-Appl-SN-751939; US-Patent-Class-364-149) Avail: US Patent and Trademark Office

An optimal control system for canceling the undesired responses of a linear distributed-parameter system in response to an input stimulus is described. The control system is optimally distributed and its design is based on the extension of the Pontryagin's maximum principle for a lumped-parameter system to a distributed-parameter system. The technique is to transform the stimulus-to-undesired-output transfer function of the distributed-parameter system into a multidimensional discrete state-space model, and to require a performance criterion to be defined. Theorems have been established to give conditions for asymptotic stability of the closed-loop distributed-parameter system, and to set up weighting factors for the performance criterion. An optimal distributed-control system can force the states of the distributed system to behave according to the prescribed performance criterion regardless of the boundary and initial conditions. The optimal control law can be implemented either as a state-feedback or an output-feedback controller. DTIC

Work has been done on analyzing the Nitinol to determine how it can be best utilized as an actuator for the robot. Using a wire-wrap gun may lead to a technique in which a piece of solid wire can be attached to the Nitinol so that there won't be fatigue of the wire or overheating damage of soldering. The utilization of small strain gauges with the Nitinol actuator is being investigated as is the use of micro-thermal couples to determine the temperature of the wire. A mechanism is being built to demonstrate the control of three muscle pairs to perform walking motions under the control of the computer program based on the neural outputs produced by the lobster during ambulation. A large number of experiments have been conducted to determine how best to drive the Nitinol with electric currents to heat it and then how best to cool it to allow it to return to its original length. MULTILAYER PIECEWISE LINEAR NETWORKS Final Report, 1993 - 1994
W. O. Alltop Sep. 1994 57 p
(AD-A285382; NAWC-WPNS-TP-8217) Avail: CASI HC A04/MF A01

Feed-forward layered networks are the simplest neural computers. These networks provide fast compact devices for computing discriminant functions and other mappings applicable to pattern recognition problems. This report treats the problem of weight initialization'/assignment for feed-forward networks with piecewise linear neuron transfer function. Specific transformations are shown to be impossible with a single hidden layer. Techniques are presented for constructing such transformations with two hidden layers. DTIC

OPTICAL PATTERN RECOGNITION Final Report
M. A. Abushagur and G. L. Henderson Aug. 1994 48 p
(AD-A285384; CSS/TR-94/26) Avail: CASI HC A03/MF A01

This study provides a basic understanding of the fundamentals of optical pattern recognition systems. An emphasis on the capabilities and limitations of such systems is presented. Areas in need of further development are highlighted. Pattern recognition using optical systems can be performed based on either correlator or non-correlator systems. Recognition can be achieved by using linear processing techniques such as wavelet transforms or nonlinear processing using morphological operations or neural networks. The fundamentals of pattern recognition are presented, specifically, Fourier transformation using lenses, and the basic optical correlator architecture. Both the 4-f in-line and joint-transform correlators are described with an emphasis on the advantages and limitations of each. Morphological processors, neural-network and wavelet transform systems are introduced along with their optical implementations. A brief overview of the optical components involved in the design and fabrication of optical pattern recognition systems is discussed. Spatial filter designs used in optical correlator systems are reviewed with particular emphasis on distortion-invariant applications. Discussion of system performance criteria, and a comparison between some of the systems, are included. DTIC

AN INTEGRATED ARCHITECTURE OF ADAPTIVE NEURAL NETWORK CONTROL FOR DYNAMIC SYSTEMS
Liu Ke, R. Tokar, and B. Mcvey 1994 8 p Presented at the Neural Information Processing Systems, Denver, CO, 29 Nov. - 3 Dec. 1994
(Contract W-7405-eng-36)
(DE94-014813; LA-UR-94-1705; CONF-941190-1) Avail: CASI HC A02/MF A01

In this study, an integrated neural network control architecture for nonlinear dynamic systems is presented. Most of the recent emphasis in the neural network control field has no error feedback as the control input which rises the adaptation problem. The integrated architecture in this paper combines feed forward control and error feedback adaptive control using neural networks. The paper reveals the different internal functionality of these two kinds of neural network controllers for certain input styles, e.g., state feedback and error feedback. Feed forward neural network controllers with state feedback establish fixed control mappings which can not adapt when model uncertainties present. With error feedbacks, neural network controllers learn the slopes or the gains respecting to the error feedbacks, which are error driven adaptive control systems. The results demonstrate that the two kinds of control scheme can be combined to realize their individual advantages. Testing with disturbances added to the plant shows good tracking and adaptation. MODELING AND IDENTIFICATION OF PARALLEL AND FEEDBACK NONLINEAR SYSTEMS
Hai-Wen Chen 1994 18 p Presented at the 33d IEEE Conference on Decision and Control, Orlando, FL, 14-16 Dec. 1994
(Contract W-7405-eng-36)
(DE95-001006; LA-UR-94-3075; CONF-941216-1) Avail: CASI HC A03/MF A01

Structural classification and parameter estimation (SCPE) methods have been used for studying single-input single, output (SISO) parallel and feedback nonlinear system models from input-output (I-O) measurements. The uniqueness of the I-O mappings of different models and parameter uniqueness of the I-O mapping of a given structural model are evaluated. The former aids in defining the conditions under which different model structures may be differentiated from one another. The latter defines the conditions under which a given model parameter can be uniquely estimated from I-O measurements. SCPE methods presented in this paper can be further developed to study more complicated multi-input multi-output (MIMO) block-structured models which will provide useful techniques for modeling and identifying highly complex nonlinear systems. AUTOMATIC GENERATION OF FUZZY RULES FOR THE SENSOR-BASED NAVIGATION OF A MOBILE ROBOT
F. G. Pin and Y. Watanabe 1994 9 p Presented at the 5th International Symposium on Robotics and Manufacturing, Maui, HI, 14-18 Aug. 1994
(Contract DE-AC05-84OR-21400)
(DE95-001428; CONF-940859-27) Avail: CASI HC A02/MF A01

A system for automatic generation of fuzzy rules is proposed which is based on a new approach, called 'Fuzzy Behaviorist', and on its associated formalism for rule base development in behavior-based robot control systems. The automated generator of fuzzy rules automatically constructs the set of rules and the associated membership functions that implement reasoning schemes that have been expressed in qualitative terms. The system also checks for completeness of the rule base and independence and/or redundancy of the rules to ensure that the requirements of the formalism are satisfied. Examples of the automatic generation of fuzzy rules for cases involving suppression and/or inhibition of fuzzy behaviors are given and discussed. Experimental results obtained with the automated fuzzy rule generator applied to the domain of sensor-based navigation in a priori unknown environments using one of our autonomous test-bed robots are then presented and discussed to illustrate the feasibility of large-scale automatic fuzzy rule generation using our proposed 'Fuzzy Behaviorist' approach. DOE

ADVANCED ROBOTIC TECHNOLOGIES FOR TRANSFER AT SANDIA NATIONAL LABORATORIES
P. C. Bennett 1994 11 p Presented at the 3d International Conference on Heat Transfer: Advanced Computational Methods in Heat Transfer, Southampton, England, 5-7 Sep. 1994
(Contract DE-AC04-94AL-85000)
(DE95-001617; SAND-94-2354C; CONF-940917-1) Avail: CASI HC A03/MF A01

Hazardous operations which have in the past been completed by technicians are under increased scrutiny due to high costs and low productivity associated with providing protective clothing and environments. As a result, remote systems are needed to accomplish many hazardous materials handling tasks such as the clean-up of waste sites in which the exposure of personnel to radiation, chemical, explosive and other hazardous constituents is unacceptable. Computer models augmented by sensing, and structured, modular computing environments are proving effective in automating many unstructured hazardous tasks. Work at Sandia National Laboratories (SNL) has focused on applying flexible automation (robotics) to meet the needs of the U.S. Department of Energy (USDOE). Dismantling facilities, environmental remediation, and materials handling in changing, hazardous environments lead to many technical challenges. Computer planning, monitoring and operator assistance shorten training cycles, reduce errors, and speed execution of operations. Robotic systems that re-use well-understood generic technologies can be much better characterized than robotic systems developed for a particular application, leading to a more reliable and safer systems. Further safety in robotic operations results from use of environmental sensors and knowledge of the task and environment. Collision detection and avoidance is achieved from such sensor integration and model-based control. This paper discusses selected technologies developed at SNL for use within the USDOE complex that have been or are ready for transfer to government and industrial suppliers. These technologies include sensors, sub-systems, and the design philosophy applied to quickly integrate them into a working robotic system. This paper represents the work of many people at the Intelligent Systems and Robotics Center at SNL, to whom the credit belongs. DOE

HETEROGENEOUS MULTI-ROBOT COOPERATION
Lynne E. Parker Feb. 1994 244 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contracts N00014-85-K-0124; N00014-91-J-4038)
(AD-A279839; AI-TR-1465) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This report addresses the problem of achieving cooperation within small to medium-sized teams of heterogeneous mobile robots. I describe a software architecture I have developed, called ALLIANCE, that facilitates robust, fault tolerant, reliable, and adaptive cooperative control. In addition, an extended version of ALLIANCE, called L-ALLIANCE, is described, which incorporates a dynamic parameter update mechanism that allows teams of mobile robots to improve the efficiency of their mission performance through learning. A number of experimental results of implementing these architectures on both physical and simulated mobile robot teams are described. In addition, this report presents the results of studies of a number of issues in mobile robot cooperation, including fault tolerant cooperative control, adaptive action selection, distributed control, robot awareness of team member actions, improving efficiency through learning, inter-robot communication, action recognition, and local versus global control. NEURAL NETWORK CONSTRUCTION VIA BACK-PROPAGATION
Thomas T. Burwick Jun. 1994 7 p Presented at the Stanford PDP Research Meeting, Stanford, CA, 23 Jun. 1994
(Contract DE-AC03-76SF-00515)
(DE95-002867; SU-SLAC-PUB-6516; CONF-9406278-1) Avail: CASI HC A02/MF A01

A method is presented that combines back-propagation with multi-layer neural network construction. Back-propagation is used not only to adjust the weights but also the signal functions. Going from one network to an equivalent one that has additional linear units, the non-linearity of these units and thus their effective presence is then introduced via back-propagation (weight-splitting). The back-propagated error causes the network to include new units in order to minimize the error function. We also show how this formalism allows to escape local minima. DOE

FORMAL MODEL FOR THE DYNAMICS OF COMPOSITIONAL REASONING SYSTEMS
Ioa Gavrila and Jan Treur Dec. 1993 63 p
(PB95-132056; IR-323) Avail: CASI HC A04/MF A01

In this report we introduce a formal model to describe in a generic manner the behavior (or dynamics) of a certain type of reasoning systems, 'compositional reasoning systems'. This model can be used to specify behavior at any desired level of detail. Our formalization is based on partial temporal models, and uses the notions of information states, transitions between them, and traces generated by these transitions. We illustrate these notions for a specific type of compositional reasoning systems, the ones that can be specified using our framework for formal DEsign and Specification of Interacting REasoning modules (DESIRE). It will be shown how various aspects of behavior of DESIRE systems can be described using the formal model for dynamics introduced in this report; it is pointed out how semantics of the dynamics of DESIRE systems can be based on this formal model. DUALITY AND EQUIVALENCIES IN CLOSED TANDEM QUEUEING NETWORKS
Zhen Liu (Institut National de Recherche d'Informatique et d'Automatique, Sophia Antipolis, France.) and Jacques A. C. Resing Sep. 1993 48 p Sponsored by ESPRIT BRA and Netherlands Organization for Scientific Research
(ISSN 0926-4493)
(PB95-132502; MEMO-COSOR-93-30) Avail: CASI HC A03/MF A01

Equivalence relations between closed tandem queueing networks are established. Four types of models are under consideration: single-server infinite-capacity buffer queues, infinite-server queues with resequencing, single-server unit-capacity buffer queues with blocking before service, and single-server unit-capacity buffer queues with blocking after service. Using a customer/server duality we show that in a network consisting of single-server infinite-capacity-buffer queues, customer-dependent service times and server-dependent service times yield equivalent performance characteristics. We further show that for closed tandem queueing networks, a system consisting of single-server infinite-capacity-buffer queues and a system consisting of single-server unit-capacity-buffer queues with blocking before service have equivalent performance behaviors. As applications of these equivalence properties, we obtain new results on the analysis of symmetric closed tandem networks, where all the service times are independent and identically distributed random variables. In particular, we obtain a closed-form expression for the throughput of networks with unit-capacity-buffer queues and blocking before service when the service times are exponentially distributed. UNKNOWN-TERRAINS NAVIGATION OF A MOBILE ROBOT USING AN ARRAY OF SONARS
N. S.V. Rao 1994 9 p Presented at the Conference on Robotics Motion and Machine Vision, Aachen, Germany, 31 Oct. - 4 Nov. 1994
(Contract DE-AC05-84OR-21400)
(DE94-017902; CONF-9410186-1) Avail: CASI HC A02/MF A01

A mobile robot equipped with an array of sonars is required to navigate to a destination through a planar terrain populated by polygonal obstacles whose locations and shapes are unknown. A navigation method is proposed based on a trapezoidal decomposition of tile terrain for an abstract formulation, where elementary navigational steps consist of following the obstacle edges and turning around the corners. The convergence of an abstract version of the algorithm is first analytically established. Then experimental results on implementing the algorithm on an experimental mobile robot are reported. DOE

SEMI-GLOBAL STABILIZATION OF LINEAR DISCRETE-TIME SYSTEMS SUBJECT TO INPUT SATURATION VIA LINEAR FEEDBACK: AN ARE-BASED APPROACH

Zongli Lin (State Univ. of New York, Stony Brook, NY.), Ali Saberi (Washington State Univ., Pullman, WA.), and Anton A. Stoorvogel Jun. 1994 17 p
(ISSN 0926-4493)
(PB95-135463; Memo-COSOR-94-17) Avail: CASI HC A03/MF A01

We revisit the problem of semi-global stabilization of linear discrete-time systems subject to input saturation and give a Riccati equation-based approach to the proof of a fact we established earlier, i.e., a linear discrete-time system subject to input saturation is semi-globally stabilizable via linear feedback as long as the linear system in the absence of the saturation is stabilizable and detectable and all its open loop poles are located inside or on the unit circle. Moreover, we drastically relax the requirements on the characteristic of the saturation elements as imposed in our earlier work. NTIS

SENSOR BASED FINE MOTION CONTROL Ph.D. Thesis

Cornelis Klomp 14 Jun. 1994 229 p
(PB95-108007; ISBN-90-9007162-8) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

The aim of the research was to develop and implement a sensor based control system which allows a robot manipulator to assemble objects. The main test case is the Bosch Turbo-SCARA robot. An overview of control algorithms for performing fine motion tasks is given. Chapter three focuses on the one-dimensional aspects of fine motion control applied to the Bosch robot. This includes the modeling of the one-dimensional sub-system, controller design and verification. The subsequent chapter deals with the multi-dimensional control aspects in a similar way. A general framework for implementing the designed controllers is presented. This framework includes hardware design as well as software design. The sixth chapter describes the application of gripper sensors, like tactile image sensors, for robotic assembly. The results obtained using the implemented task description language in combination with the designed controllers are presented. Finally, the conclusions are drawn and some suggestions for future research are made. NTIS

ADAPTIVE CAPTURE OF EXPERT BEHAVIOR

R. D. Jones, C. L. Barrett, U. Hand, and R. C. Gordon Aug. 1994 28 p
(Contract W-7405-eng-36)
(DE94-018285; LA-UR-94-2825) Avail: CASI HC A03/MF A01

The authors smoothed and captured a set of expert rules with adaptive networks. The motivation for doing this is discussed as follows: (1) Smoothing leads to stabler control actions; (2) For some sets of rules, the evaluation of the rules can be sped up. This is important in large-scale simulations where many intelligent elements are present; (3) Variability of the intelligent elements can be achieved by adjusting the weights in an adaptive network; (4) After capture has occurred, the weights can be adjusted based on performance criteria. The authors thus have the capability of learning a new set of rules that lead to better performance. The set of rules the authors chose to capture were based on a set of threat determining rules for tank commanders. The approach in this paper: (1) They smoothed the rules. The rule set was converted into a simple set of arithmetic statements. Continuous, non-binary inputs, are now permitted; (2) An operational measure of capturability was developed; (3) They chose four candidate networks for the rule set capture: (a) multi-linear network, (b) adaptive partial least squares, (c) connectionist normalized local spline (CNLS) network, and (d) CNLS net with a PLS preprocessor. These networks were able to capture the rule set to within a few percent. For the simple tank rule set, the multi-linear network performed the best. When the rules were modified to include more nonlinear behavior, CNLS net performed better than the other three nets which made linear assumptions; (4) The networks were tested for robustness to input noise. Noise levels of plus or minus 10% had no real effect on the network performance. Noise levels in the plus or minus 30% range degraded performance by a factor of two. Some performance enhancement occurred when the networks were trained with noisy data; (5) The scaling of the evaluation time was calculated; (6) Human variation can be mimicked in all the networks by perturbing the weights. DOE

LEARNING ALGORITHMS FOR FEEDFORWARD NETWORKS BASED ON FINITE SAMPLES

N. S. V. Rao, V. Protopopescu, R. C. Mann, E. M. Oblow, and S. S. Iyengar Sep. 1994 37 p
(Contract DE-AC05-84OR-21400)
(DE95-001739; ORNL/TM-12819) Avail: CASI HC A03/MF A01

Two classes of convergent algorithms for learning continuous functions (and also regression functions) that are represented by feedforward networks, are discussed. The first class of algorithms, applicable to networks with unknown weights located only in the output layer, is obtained by utilizing the potential function methods of Aizerman et al. The second class, applicable to general feedforward networks, is obtained by utilizing the classical Robbins-Monro style stochastic approximation methods. Conditions relating the sample sizes to the error bounds are derived for both classes of algorithms using martingale-type inequalities. For concreteness, the discussion is presented in terms of neural networks, but the results are applicable to general feedforward networks, in particular to wavelet networks. The algorithms can be directly adapted to concept learning problems. DOE

DESIGN OF ROBUST OPTIMAL CONTROL SYSTEMS AND STABILITY ANALYSIS OF REAL STRUCTURED UNCERTAINTIES Final Report, Aug. 1990 - Mar. 1994

Bor-Chin Chang and Ajmal Yousuff Mar. 1994 149 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F33615-90-C-3613)
(AD-A279089; WL-TR-94-3030) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This report addresses the computational problems arising in the design of robust controllers via H-inf optimization and mu-synthesis and proposes several new controller reduction approaches. Through our discovery of the convexity and monotonicity properties of the general parameter dependent H-inf Riccati equation, a quadratically convergent algorithm which is faster than the other existing search schemes is developed to compute the optimal H-inf norm. It is desired to preserve the closed-loop stability and performance while reducing the order of the controller. A structured truncation technique based on the closed-loop controllability and observability diagrams, an H-inf controller parameterization and reduction method, and an observer-based controller parameterization and reduction procedure are employed to achieve this objective. GENERIC ARCHITECTURE FOR KNOWLEDGE-BASED CONTROL OF PROCESSES IN DYNAMIC ENVIRONMENTS

F. Brazier, D. deKlerk, P. vanLangen, and J. Treur Dec. 1993 41 p
(PB95-132676) Avail: Issuing Activity (National Technical Information Service (NTIS))

In the report the authors explore knowledge-based control of processes in dynamic environments, the main focus being on the design and formal specification of compositional architectures for such complex tasks. After introducing the notions of dynamic environment, process, plan and compositional architecture, the authors present a generic, compositional architecture for knowledge-based control of processes in dynamic environments. Then they describe the dynamic environment of a shipyard, where the processes of interest are pipe installation activities. The authors present the main features of DESIRE (DEsign and Specification of Interacting REasoning modules), the framework for the design and specification of compositional architectures, and show how DESIRE has been used to formally specify the application of the generic architecture to the control of pipe installation activities. Finally, the authors draw some conclusions about the generic architecture for knowledge-based control of processes in dynamic environments. NTIS

ARTIFICIAL NEURAL NETWORK METAMODELS OF STOCHASTIC COMPUTER SIMULATIONS Final Report, 25 Jun. 1990 - 10 Aug. 1994 Ph.D. Thesis
Robert Allen Kilmer 10 Aug. 1994 254 p Sponsored by Army
(AD-A285951) Avail: CASI HC A12/MF A03

A computer simulation model can be thought of as a relation that connects input parameters to output measures. Since these models can become computationally expensive in terms of processing time and/or memory requirements, there are many reasons why it would be beneficial to be able to approximate these models in a computationally expedient manner. This research examines the use of artificial neural networks (ANN), to develop a metamodel of computer simulations. The development and use of the Baseline ANN Metamodel Approach is provided and is shown to outperform traditional regression approaches. The results provide a solid foundation and methodological direction for developing ANN metamodels to perform complex tasks such as simulation optimization, sensitivity analysis, and simulation aggregation/reduction. DISCRETE ALGEBRAIC RICCATI EQUATION AND LINEAR MATRIX INEQUALITY
A. A. Stoorvogel and A. Saberi (Washington State Univ., Pullman, WA.) 9 May 1994 35 p Sponsored by Royal Netherlands Academy of Sciences and Arts
(ISSN 0926-4493)
(PB95-133575; MEMO-COSOR-94-16) Avail: CASI HC A03/MF A01

In this paper we study the discrete time algebraic Riccati equation and its connection to the discrete time linear matrix inequality. We show that in general only a subset of the set of rank-minimizing solutions of the linear matrix inequality correspond to the solutions of the associated algebraic Riccati equation, and study under what conditions these sets are equal. In this process we also derive very weak assumptions under which a Riccati equation has a solution. NTIS

ADAPTIVE FAULT-RESISTANT SYSTEMS Final Technical Report, Aug. 1992 - Apr. 1994
Jack Goldberg, Ira Greenberg, Raymond Clark, E. D. Jensen, and Kane Kim Oct. 1994 160 p
(Contract F30602-92-C-0098)
(AD-A286406; RL-TR-94-191) Avail: CASI HC A08/MF A02

The combined effects of faults and resource failures, wide swings in service demand, and situation-dependent user requirements, stress a computer's ability to satisfy its service expectations. This is an especially significant problem in distributed systems that employ unreliable communications, and whose components may operate in different and perhaps harsh physical data and usage environments. One of the goals for adaptive design is to allow flexible use of available resources to cover a much wider range of different kinds of environmental variables than could be covered by a fixed, worst-case design. The research focused on the tasks of: (1) developing a theory of adaptive fault-resistant systems and general principles of architectural design; (2) developing specific architectural design techniques; and (3) demonstrating adaptive designs. Three mechanisms were investigated: (1) Adaptive Distributed Recovery Blocks (ADRB's), a multiple-mode scheme for error detection and recovery, useful for both hardware and software faults; (2) adaptive fault tolerance for hybrid faults, an economical technique for tolerating both simple and complex fault types; and (3) adaptive distributed thread integrity, a technique for detecting and repairing thread breaks in a wide range of operating environments using the Alpha programming model. This final report covers the work done by our group of neural network computing at the University of Maryland for the past three years. We studied the neural network's capability of processing temporal or sequential data. Recurrent neural networks were used to perform inference on grammars. An external memory stack was constructed to work with the neural network to perform inferences on context free languages. And finally, a spatially homogeneous locally connected recurrent neural network that could simulate any given turing machine, including the universal Turing machine was devised. It is capable of performing universal computations and demonstrated the universal power of recurrent neural network architectures. To train these sequential neural net machines, we have investigated the forward propagating learning algorithms. DTIC

ARTIFICIAL INTELLIGENCE (AI) AND Ada: INTEGRATING AI WITH MAINSTREAM SOFTWARE ENGINEERING Final Report
Jorge L. Diaz-Herrera Sep. 1994 63 p
(Contract F19628-90-C-0003)
(AD-A286093; CMU/SEI-94-TR-09; ESC-TR-94-009) Avail: CASI HC A04/MF A01

In this report we discuss in detail pragmatic problems posed by the integration of AI with conventional software engineering, and within the framework of current Ada technology. A major objective of this work has been to begin to bridge the gap between the Ada and AI software cultures. The report summarizes survey results from the Association for Computing Machinery (ACM) Special Interest Group for Ada (SIGAda) AI Working Group (AIWG), highlighting lessons learned and sample applications. An interesting observation is that a large percentage of AI code is procedural by nature and that better productivity rates are achieved by using Ada; also, efficiency is much better when compared to traditional AI languages. Although we show favorable results on the use of Ada technology for the implementation of AI software, a total integration remains difficult at the conceptual level. There are some impediments to a completely satisfactory solution, but only a few restrictions are more intrinsically related to the current Ada standard (Ada83); these, however, are being dealt with in the next revision known as Ada9X. OPTIMAL CONTROL OF A TWO WHEELED MOBILE ROBOT M.S. Thesis
Bryan R. Emond Sep. 1994 163 p
(AD-A286130) Avail: CASI HC A08/MF A02

Feedback control of a two wheeled mobile robot from one point in its configuration space to another presents a challenging problem. The mobile robot belongs to a class of systems with non-integrable motion constraints for which smooth feedback control laws cannot be designed. Recent work has been aimed at developing time-varying feedback control laws and piecewise smooth feedback control laws. These control techniques are, however, not optimal in any sense. In this research, we look into the optimal control of a mobile robot using partial feedback. A solution is obtained by application of Pontryagin's Minimization Principle and solving the associated two point boundary value problem using a numerical relaxation technique. The resulting robot trajectories exhibit optimal behavior for all non-trivial cases. DTIC

LAYERED PATH PLANNING FOR AN AUTONOMOUS MOBILE ROBOT M.S. Thesis
Timothy A. Haight Sep. 1994 115 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A286138) Avail: CASI HC A06

In order to continue to improve the usefulness of robots, it is becoming increasingly important to have them act as autonomous agents. A significant step toward this object is autonomous motion planning. This research was conducted as part of a broader effort to empower Yambico-11, a mobile robot under development at the Naval Postgraduate School, with ability to move autonomously. We believe that this problem is best attacked in layers. This thesis is our proposal for the initial layer. Given a robot's current location and its goal location, we use the homotopy relation to reduce the infinite set of path choices into a more manageable and smaller set of path classes. Specifically, we solve the problem of how to enable a robot to autonomously identify and label these classes of paths. We begin by decomposing the robot's operating environment into a collection of convex pieces called cells. The cells are transformed into a graph by adjacency. We show that every simple path on the graph corresponds to a unique simple homotopy class in the robot's world. We then search the graph to give each class a symbolic representation which also provides intermediate path planning clues. Subsequent layers can use these clues to form a more detailed plan. We implement the cell decomposition, graph transformation, and path class labeling as C programs, and preprocess them on a Unix workstation. This resulting data structures are then compiled and linked into the robot's kernel. All implementation has been integrated into the model-based mobile robot language (mml) used by Yamabico-11. DTIC

LEARNING MANEUVERS USING NEURAL NETWORK MODELS Final Report, 1 Apr. 1993 - 31 Mar. 1994
Christopher Atkeson 7 Aug. 1994 128 p
(Contract F49620-93-1-0263)
(AD-A286470; AFOSR-94-0702TR) Avail: CASI HC A07/MF A02

The researchers explored issues involved in implementing robot learning for a challenging dynamic task, using a case study from robot juggling. They used a memory based local modeling approach (locally weighted regression) to represent a learned model of the task to be performed. Statistical tests are given to examine the uncertainty of a model, to optimize its prediction quality, and to deal-with noisy and corrupted data. They developed an exploration algorithm that explicitly deals with prediction accuracy requirements during exploration. Using all these ingredients in combination with methods from optimal control, the robot achieves fast real-time learning of the task within 40 to 100 trials. DTIC

QUADRATIC OPTIMAL CONTROL OF A DELAY EQUATION II: THE UNSTABLE CASE Research Report
O. J. Staffans Jun. 1994 22 p See also PB95-127072
(PB95-127064; RR-A334) Avail: CASI HC A03/MF A01

The authors consider the infinite horizon quadratic cost minimization problem for a certain class of systems with finitely may inputs and outputs. The authors approach is to interpret the system as a delay equation, and to user a transfer function approach. This is the second half of a two-part paper. In the first part the authors have discussed the case where the system is stable, and this part is devoted to an extension of the theory to the unstable case. Out of many possible formulations of the unstable case the authors have chosen a right coprime factorization approach, as this seems to be the most natural and simple one. As in the stable case, the authors are able to reduce the problem to a symmetric Wiener-Hopf factorization problem, and all the authors' main constructions and conclusions for the stable case carry over to the unstable case. QUADRATIC OPTIMAL CONTROL OF A DELAY EQUATION I: THE STABLE CASE Research Report
O. J. Staffans Apr. 1994 27 p See also PB95-127064
(PB95-127072; RR-A332) Avail: CASI HC A03/MF A01

The authors consider the infinite horizon quadratic cost minimization problem for a certain class of systems with finitely may inputs and ouputs. This class contains all detectable and stabilizable systems of Pritchard-Salamon type with finitely many inputs and outputs as a proper subclass. The most common approach to treat a problem of this type is to construct a semigroup in an abstract state space, and to use infinite dimensional control theory. However, this approach is less appealing in the case where there are discrete time delays in the transfer function, because such time delays cause the input and output operators to become too unbounded compared to the generator of the semigroup to be comfortably handled. In particular, the system is then no longer of Pritchard-Salamon type. In order to be able to include this case, the authors take an alternative approach, and reduce the problem to a symmetric Weiner-Hopf problem, that can be solved by means of a canonical factorization of the symbol. In a standard delay equation realization of the system, this amounts to factorizations of the Riccati operator and the feedback operator into convolution operators and projections. In particular, the authors show that, under their assumptions, the optimally controlled system is well-posed in every L(sup p)-space, I = or less than p = or less than inifinty, and not just the usual L(sup 2)-space. It is also well-posed in (a subspace of) the space of continuous functions. Part I of this paper deals with the case where the system is stable; the unstable case is discussed in Part II. NTIS

SIMULATION OF STRUCTURAL RESPONSE USING A RECURRENT RADIAL BASIS FUNCTION NETWORK
T. L. Paez 1994 10 p Presented at the 1st World Conference on Structural Control, Pasadena, CA, 3-5 Aug. 1994
(Contract DE-AC04-94AL-85000)
(DE94-017342; SAND-94-2079C; CONF-9408141-1) Avail: CASI HC A02/MF A01

System behaviors can be accurately simulated using artificial neural networks (ANN's), and one that performs well in simulation of structural response is the radial basis function network. A specific implementation of this is the connectionist normalized linear spline (CNLS) network, investigated in this study. A useful framework for ANN simulation of structural response is the recurrent network. This framework simulates the response of a structure one step at a time. It requires as inputs some measures of the excitation, and the response at previous times. On output, the recurrent ANN yields the response at some time in the future. This framework is practical to implement because every ANN requires training, and this is executed by showing the ANN examples of correct input/output behavior (exemplars), and requiring the ANN to simulate this behavior. In practical applications, hundreds or, perhaps, thousands, of exemplars are required for ANN training. The usual laboratory and non-neural numerical applications to be simulated by ANN's produce these amounts of information. Once the recurrent ANN is trained, it can be provided with excitation information, and used to propagate structural response, simulating the response it was trained to approximate. The structural characteristics, parameters in the CNLS network, and degree of training influence the accuracy of approximation. This investigation studies the accuracy of structural response simulation for a single-degree-of-freedom (SDF), nonlinear system excited by random vibration loading. The ANN used to simulate structural response is a recurrent CNLS network. We investigate the error in structural system simulation. DOE

A SURVEY OF ARTIFICIAL NEURAL NETWORK APPLICATIONS IN FLOW ANALYSIS OF ENERGY NETWORKS
Varun Madhok Nov. 1994 34 p
(Contract W-7405-eng-36)
(DE95-002452; LA-12855-MS) Avail: CASI HC A03/MF A01

This report presents the results of a literature survey carried out to analyze the work done so far using artificial neural networks (ANN's) in tasks of flow assessment in networked systems. The survey revealed that current implementations developed so far may be classified as pattern analysis and optimization, with a parallel grouping for the types of ANN's used: the feedforward network trained using error backpropagation and the Hopfield network. Pattern analysis has been used in developing ANN's for prediction and system security monitoring, with the Kohonen feature map, as well as the backpropagation type of network, being useful in the latter application. Results have been promising, showing ANN's potential for use in problems of load flow analysis in dense energy networks or in system monitoring in hazardous situations. Problems of the nature of resource scheduling, optimal path search, and so forth, have been handled in general by methods based on Hopfield dynamics. By and large, however, large-scale commercial applications of ANN's are rare. Industry has failed to exploit the technology fully, probably because of a lack of funding and the necessary multifaceted scientific workforce. DOE

GENERAL CONSERVATIVE EXTENSION THEOREM IN PROCESS ALGEBRA
C. Verhoef Nov. 1993 26 p
(PB95-110656) Avail: CASI HC A03/MF A01

The authors proved a general conservative extension theorem for transition system based process theories with easy-to-check and reasonable conditions. The core of this result is another general theorem giving sufficient conditions for a system of operational rules and an extension ensuring that outgoing transitions from an original term in the extension are the same as in the original system. As a simple corollary of the conservative extension theorem, the authors proved a completeness theorem. As a first application of their conservativity results, the authors proved a general theorem giving sufficient conditions to reduce the question of ground confluence modulo (some equations for a large term rewriting system associated with an equation process theory) to a small term rewriting system under the condition that the large system is a conservative extension of the small one. The authors proved many other applications to show that the results are useful. The applications include (but are not limited to) various real and discrete time settings in Calculus of Communicating Systems (CCS), Algebra of Communicating Processes (ACP), and Algebra of Timed Processes (ATP), and the notions projection, renaming, state operator, priority, recursion, the silent step, and the empty process. TESTING PARADIGM APPLIED TO NETWORK STRUCTURE (REVISED)
T. Verhoeff Mar. 1994 44 p
(PB95-110706) Avail: CASI HC A03/MF A01

The testing paradigm provides a simple framework for comparing networks of processes. In this note, we use the testing paradigm to compare structural aspects of process networks. Central to our approach are the following three ingredients: (1) Tests are drawn from the set of process networks; (2) A (global) correctness concern, in the form of a predicate, expresses when a network is correct as an autonomous system; (3) A network passes a test when the composition of two networks involved is a correct (autonomous) system. Our approach has several merits. It allows a uniform treatment of structure and behavior. Structural and behavioral correctness concerns can be varied independently within the same framework. Structural correctness concerns can be made explicit at the very beginning, and need not appear implicitly as an unmotivated afterthought. For one particular choice of (structural) correctness concerns, we work out a model in full detail. We briefly investigate alternative correctness concerns. NTIS

PROCESS ALGEBRA WITH PARTIAL CHOICE
J. C. M. Baeten and J. A. Bergstra (Amsterdam Univ., Netherlands.) Mar. 1994 26 p
(PB95-110714) Avail: CASI HC A03/MF A01

The objective of this paper is to bridge the gap between the Algebra of Communicating Processes (ACP) and the Theory of Communicating Sequential Processes (TCSP). To this end, ACP is extended with two non-deterministic choice operators in a setting of bisimulation semantics. With these operators, we can express safety properties of systems without the use of silent steps, and we can verify safety properties in a setting in which no assumption on fairness (or unfairness) has been made. MULTIGRID WITH MATRIX-DEPENDENT TRANSFER OPERATORS FOR CONVECTION-DIFFUSION PROBLEMS
A. Reusken Jul. 1993 22 p
(PB95-110821; RANA-93-10) Avail: CASI HC A03/MF A01

It was previously proved that for 1D convection-diffusion problems the use of suitable matrix-dependent transfer operators results in a multigrid method which is robust with regard to variation in the amount of convection, even if one uses damped Jacobi for smoothing. The main subject of this paper is a generalization of the 1D approach, resulting in a new multigrid method for 2D convection-diffusion problems. We remain close to the red-black structure of the 1D case. We briefly explain our multigrid method for the case with uniform square grids and standard h to 2h coarsening. Results of numerical experiments again show robustness. NTIS

SOLUTIONS OF D(SUP n)D(SUP m)f=0
B. Klein Obbink May 1993 42 p
(PB95-110839; RANA-93-07) Avail: CASI HC A03/MF A01

In the papers of R.W. Hopper and J. de Graaf, there are given some exact solutions of the shape evolution of a two-dimensional piece of viscous matter driven by surface tension on the free boundary. After making some assumptions and approximations, they described such a physical system with a set of the following equations. The derivation of the evolution equation for the change of the shape in time is then based on complex analysis. The starting point is to solve Stoke's equations in terms of holomorphic functions. An analogous treatment of the three-dimensional problem may be based on hypercomplex analysis. The starting point would then be to solve Stokes' equations in three dimensions in terms of left monogenic functions. That is exactly what will be done in the paper: the authors will show that the general solution of Stokes' equations on three-dimensional, special x-normal domains can be represented by two left monogenic functions. NTIS

WEIGHTED STRONGLY ELLIPTIC OPERATORS ON LIE GROUPS
A. F. M. terElst and Derek W. Robinson (Australian National Univ., Canberra, Australia.) Jul. 1993 54 p
(PB95-110847; RANA-93-11) Avail: CASI HC A04/MF A01

Within the general theory of elliptic operators, the twin notions of subelliptic operator and weighted elliptic operator play related but distinct roles. Subellipticity is based on the idea that there is a certain subset of preferred directions, but in the weighted theory all directions are allowed although some have a greater weight, or preference. Both concepts have non-commutative aspects and are naturally described in the setting of Lie groups. In this paper we develop the theory of weighted strongly elliptic operators for Lie groups in analogy with the subelliptic theory. We start with a basis for the Lie algebra, give each direction a weight, define weighted strongly elliptic forms and then introduce weighted strongly elliptic operators associated with an arbitrary strongly continuous or weakly continuous representation of the Lie group on a Banach space. Under a suitable condition on the Lie algebraic structure, we prove that the closure of each such operator generates a continuous semigroup, which has a representation independent kernel. We then derive kernel bounds, regularity and analyticity properties, et cetera. NTIS

ORTHOGONAL REPRESENTATIONS OVER FINITE FIELDS AND THE CHROMATIC NUMBER OF GRAPHS
R. Peeters 1994 22 p
(PB95-110953; FEW-622) Avail: CASI HC A03/MF A01

We study the relationship between the minimum dimension of an orthogonal representation of a graph over a finite field and the chromatic number of its complement. It turns out that for some classes of matrices defined by a graph that the 3-colorability problem is equivalent to deciding whether the class defined by the graph has a matrix of rank 3 or not. This implies the NP-hardness of determining the minimum rank of a matrix in such a class. NTIS

BEYOND BETA-REDUCTION IN CHURCH'S LAMBDA YIELD
Roel Bloo, Fairouz Kamareddine (Glasgow Univ., Scotland.), and Rob Nederpelt 26 Apr. 1994 29 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB95-110565) Avail: CASI HC A03

In the paper, the authors observed that if they change slightly the classical lambda-notation, then they can make more redexes visible. This is useful and is in line with current research on the needed redexes (for normal forms). The authors have shown further that, using item notation (which makes more redexes visible), one is able to stick to the old beta-reduction and just do a simple reshuffling so that these newly visible redexes can be contracted before other redexes. The authors have shown that this reshuffling (which is very simple and can only be enabled in the authors' notation), is correct. In fact, reshuffling does really make all redexes subject to immediate contraction and preserves typing. So, if t has type rho then the reshuffled version of t also has type rho. NTIS

THE NONLINEAR CHARACTERISTIC SCHEME IN X-Y GEOMETRIES
W. F. Walters and T. A. Wareing 1994 7 p Presented at the Winter Meeting of the American Nuclear Society, Washington, DC, 13-18 Nov. 1994
(Contract W-7405-eng-36)
(DE94-016192; LA-UR-94-2644; CONF-941102-16) Avail: CASI HC A02/MF A01

The nonlinear characteristic (NC) scheme for solving the discrete-ordinates form of the transport equation has recently been introduced and used to analyze one-dimensional slab transport problems. The purpose of this paper is to determine the accuracy and positivity of the NC scheme as extended to solve two-dimensional X-Y problems. We compare the results obtained using the NC scheme to those obtained using the bilinear discontinuous (BLD) scheme, the bilinear nodal (BLN) scheme, linear characteristic scheme, and the diamond difference with fixup (DD/F) scheme. As was found in one-dimensional applications, the NC scheme is strictly positive and as accurate or more accurate than the other schemes for all meshes examined. The accuracy of the NC scheme for coarse meshes is particularly outstanding compared to that of the other schemes. DOE

Shepard (New Hampshire Univ., Durham, NH.) 29 Jun. 1994 30 p Presented at the Quantum Complexity in Mesoscopic Systems, Los Alamos, NM, 16-20 May 1994 Limited Reproducibility: More than 20% of this document may be affected by poor print
(Contract W-7405-eng-36)
(DE94-016196; LA-UR-94-2479; CONF-9405204-1) Avail: Issuing Activity (Department of Energy (DOE))

When a classical oscillator is interacting with a purely quantum mechanical oscillator, described by the Lagrangian L = 1/2 x(exp 2) + 1/2 A(exp 2) - 1/2 (m(exp 2) + e(exp 2) A(exp 2)) x(exp 2), where A is a classical variable and x is a quantum operator the relevant degrees of freedom for the quantum oscillator, when (x(t)) = 0, is (x(t)x(t)) = G(t). The classical Hamiltonian dynamics governing the variables A(t), Pi(sub A)(t), G(t), and Pi(sub G)(t) is chaotic so that the results of making measurements on the quantum system at later times are sensitive to initial conditions. We review this system and discuss how this behavior is altered when the quantum fluctuations of the A oscillator are determined exactly and in a 1/N expansion where N is the number of copies of the x oscillator. A CONTROL VOLUME METHOD ON AN ICOSAHEDRAL GRID FOR NUMERICAL INTEGRATION OF THE SHALLOW-WATER EQUATIONS ON THE SPHERE
I.-Liang Chern 1994 40 p
(Contract W-31-109-eng-38)
(DE94-016345; ANL/MCS/PP-73014) Avail: CASI HC A03/MF A01

Two versions of a control volume method on a symmetrized icosahedral grid are proposed for solving the shallow-water equations on a sphere. One version expresses the equations in the 3-D Cartersian coordinate system, while the other expresses the equations in the northern/southern polar stereographic coordinate systems. The pole problem is avoided because of these expressions in both versions and the quasi-homogenity of the icosahedral grid. Truncation errors and convergence tests of the numerical gradient and divergent operators associated with this method are studied. A convergence test for a steady zonal flow is demonstrated. Several simulations of Rossby-Haurwitz waves with various numbers are also performed. DOE

SQUEEZING AND FLOW OF ENERGY FOR NON LINEAR WAVE EQUATIONS
S. B. Kuksin Jul. 1994 34 p
(PB95-111100; IHES/M/94/39) Avail: CASI HC A03/MF A01

The authors study the nonlinear wave equation u'' - delta(sup 2) Delta u + f(u) = 0 under n-dimensional periodic boundary conditions (n = 1, 2, 3) in a Sobolev phase-space H(sup s) = H(sup s) x H(sup s-1)(T(sup n)) = ((u, u')(x)). In another paper by the author, the author interpreted the 'energy transition to higher frequencies' problem for this (and similar) equations as a squeezing: time-t flow maps of the equation with large t 'squeeze' r-balls in H(sup S) to narrow cylinders formed by vector-functions with norms of first Fourier coefficients less then some small gamma. The authors proved also a version of Gromov's squeezing theorem: the phenomenon stated above is impossible for gamma less than r if for H(sup s) is chosen the symplectic phase space of the equation, H(sup s) = H(sup 1/2). In this paper the authors show that in smooth phase spaces H(sup s), s greater than or equal to 5, the squeezing is typical if the dispersion delta is small. The authors use this result and some related statements to obtain a picture of qualitative behavior of solutions of the phi(sup 4) equation u'' - delta(sup 2) Delta u + u(exp 3) = 0. NTIS

EVALUATING IMPEDANCES IN A SACHERER INTEGRAL EQUATION
S. Y. Zhang and W. T. Weng 1994 4 p Presented at the 4th European Particle Accelerator Conference, London, England, 27 Jun. - 1 Jul. 1994
(Contract DE-AC02-76CH-00016)
(DE94-016823; BNL-49826; CONF-940618-62) Avail: CASI HC A01/MF A01

In a Sacherer integral equation, the beam line density is expanded on the phase deviation (phi), generating a Hankel spectrum, rather than on the time, which generates a Fourier spectrum. This is a natural choice to deal with the particle evolution in phase space, however, it causes complications whenever the impedance corresponding to the spectrum has to be evaluated. In this article, the line density expansion on (phi) is shown to be equivalent to a beam time modulation under an acceptable condition. Therefore for a Hankel spectrum, a number of sidebands, and the corresponding impedance as well, will be involved. For wideband resonators, it is shown that the original Sacherer solution is adequate. For narrowband resonators, the solution had been compromised, therefore a modification may be needed. DOE

BANACH SPACES WITH SMALL SPACES OF OPERATORS
W. T. Gowers and B. Maurey Jul. 1994 32 p
(PB95-111134; IHES/M/94/44) Avail: CASI HC A03/MF A01

A space X was constructed with the property that every operator from a subspace Y to X was of the form lambda i + S, where i is the inclusion map and S is strictly singular. Among the easy consequences of this fact are that X contains no unconditional basic sequence, and, more generally, that X is hereditarily indecomposable: that is, no subspace of X admits any nontrivial projection. Section 2 introduces notation and some basic lemmas. In the third section the authors state and prove the main result of the paper. The applications are given in the fourth section. The fifth and final section contains a discussion of the space with an unconditional basis. The authors also ask some questions about the possibility of removing some of the restrictions needed for the main result. NTIS

THE METHOD OF AUXILIARY MAPPING FOR THE FINITE ELEMENT SOLUTIONS OF ELASTICITY PROBLEMS CONTAINING SINGULARITIES
Hae-Soo Oh and Ivo M. Babuska Sep. 1994 44 p
(Contract N00014-90-J-1030; NSF DMS-91-20877; NSF ASC-91-13895)
(AD-A285689; TN-BN-1178) Avail: CASI HC A03/MF A01

Babuska and Oh have introduced a new approach called the Method of Auxiliary Mapping (MAM), to deal with elliptic boundary value problems with singularities. In this paper this method is extended so that it can handle the plane elasticity problems containing singularities. In order to show the effectiveness, this method is compared with the conventional approach in the framework of the p-version of the finite element method. Moreover, it is demonstrated that this method yields a reasonable solution for those elasticity problems containing strong singularities which even can not be solved by using the h-p version of the finite element method. EXPLICIT PARALLEL TWO-STEP RUNGE-KUTTA-NYSTROEM METHODS
Cong NguyenHuu Jan. 1994 18 p
(PB95-135752; CWI-NM-R9401) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

The aim of this paper is to design a class of two-step Runge-Kutta-Nystrom methods of arbitrarily high order for the special second-order equation y(sup 2)(t) = f(y(t)) for use on parallel computers. Starting with an s-stage implicit two-step Runge-Kutta-Nystrom method of order p with k = p/2 implicit stages, we apply the highly parallel predictor-corrector iteration process in P(EC)(sup m)E mode. In this way, we obtain an explicit two-step Runge-Kutta-Nystrom method that has order p for all m and that requires k(m+1) righthand side evaluations per step of which each k evaluation can be computed in parallel. By a number of numerical experiments, we show the superiority of the parallel predictor-corrector methods proposed in this paper over both sequential and parallel methods available in the literature. PARALLELISM ACROSS THE STEPS IN ITERATED RUNGE-KUTTA METHODS FOR STIFF INITIAL VALUE PROBLEMS

P. J. vanderHouwen, B. P. Sommeijer, and W. A. vanderVeen Nov. 1993 18 p

(PB95-135760; CWI-NM-R9322) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

For the parallel integration of stiff initial value problems (IVP's), three main approaches can be distinguished: approaches based on 'parallelism across the problem', 'parallelism across the method' and on 'parallelism across the steps'. The first type of parallelism does not require special integration methods and can be exploited within any available IVP solver. The method-parallel approach received some attention in the case of Runge-Kutta based methods. For these methods, the required number of processors is roughly half the order of the generating Runge-Kutta method and the speed-up with respect to a good sequential IVP solver is about a factor 2. The third type of parallelism (step-parallelism) can be achieved in any IVP solver based on predictor-corrector iteration. Most step-parallel methods proposed so far employ a large number of processors, but lack the property of robustness, due to a poor convergence behavior in the iteration process. Hence, the effective speed-up is rather poor. The step-parallel iteration process proposed in the present paper is less massively parallel, but turns out to be sufficiently robust to achieve speed-up factors up to 10 with respect to the best sequential codes. FITTING STOCHASTIC PARTIAL DIFFERENTIAL EQUATIONS TO SPATIAL DATA Final Report, 1 Oct. 1989 - 30 Sep. 1993

Richard H. Jones 30 Sep. 1993 2 p Sponsored by ONR Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(AD-A279870) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The research under this project was aimed at developing numerical methods for fitting stochastic partial differential equations to irregularly spaced spatial data. This is related to two dimensional smoothing spline fitting where the partial differential equation is the Laplacian driven by white noise. A class of continuous two dimensional spatial autoregressive, moving average (ARMA) models were investigated and numerical methods developed to implement fitting these models to spatial data. The spatial ARMA models provide a complete class of covariance structures rather than a very limited set of covariance functions that are typically used in Kriging. Since maximum likelihood methods are used to fit the models, methods such as likelihood ratio tests and Akaike's Information Criterion (AIC) can be used for model selection. Prediction maps can then be calculated at a grid of points, and contour maps drawn. Also maps can be drawn of the standard deviation of the predicted fields giving indications of the variability of the predictions. Applications include aquifer heights, coal field depth and thickness and snowfall amounts. Results have been presented in a number of presentations and publications. DTIC

In this paper we introduce a new definition of superconvergence - the eta%-superconvergence, which generalizes the classical idea of superconvergence to general meshes. We show that this new definition can be employed to determine the regions of least error in any element in the interior of any grid by using a computer-based approach. We present numerical results for the standard displacement finite element method for the scalar equation of orthotropic heat-conduction. The results demonstrate that eta% superconvergence is applicable to the complexgrids which are employed in practical engineering computations. DTIC

we addressed (in part one) the problem of existence of superconvergence points by a computer-based proof and we gave a detailed study of the superconvergence points for the components of the gradient in finite element solutions for Laplace's and Poisson's equations. Here we employ the same approach to study the superconvergence for the gradient of the displacement, the strain and the stress for finite element solutions of the equations of plane elasticity. We give the superconvergence points for the components of the gradient of the displacement, the strain and stress for meshes of triangles and squares of degree p, with 1 less than or equal to p less than or equal to 4. For the meshes of triangles we investigated the effect of the topology of the mesh by considering four mesh-patterns which typically occur in practical meshes, while in the case of square elements we studied the effect of the element-type (tensor-product, serendipity or other). A 0, +/- 1 matrix A is balanced if, in every submatrix with two nonzero entries per row and column, the sum of the entries is a multiple of four. This definition was introduced by Truemper and generalizes the notion of balanced 0,1 matrix introduced by Berge. In this paper, we survey what is currently known about these matrices, including polyhedral results, structural theorems, recognition algorithms and the relation with some problems in logic. DTIC

This paper discusses issues in the design of ScaLAPACK, a software library for performing dense linear algebra computations on distributed memory concurrent computers. These issues are illustrated using the ScaLAPACK routines for reducing matrices to Hessenberg, tridiagonal, and bidiagonal forms. These routines are important in the solution of eigenproblems. The paper focuses on how building blocks are used to create higher-level library routines. Results are presented that demonstrate the scalability of the reduction routines. The most commonly-used building blocks used in ScaLAPACK are the sequential BLAS, the Parallel Block BLAS (PB-BLAS) and the Basic Linear Algebra Communication Subprograms (BLACS). Each of the matrix reduction algorithms consists of a series of steps in each of which one block column (or panel), and/or block row, of the matrix is reduced, followed by an update of the portion of the matrix that has not been factorized so far. This latter phase is performed using distributed Level 3 BLAS routines, and contains the bulk of the computation. However, the panel reduction phase involves a significant amount of communication. And is important in determining the scalability of the algorithm. The simplest way to parallelize the panel reduction phase is to replace the appropriate Level 2 and Level 3 BLAS routines appearing in the LAPACK routine (mostly matrix-vector and matrix-matrix multiplications) with PB-BLAS routines. The research dealt with computing methods for applications in aerodynamics, geophysics, hydrodynamics, meteorology, and oceanography. Analysis was done of adaptive numerical methods for time-dependent problems in complicated physical domains which can efficiently and reliably approximate singular and near singular features of the solution such as fronts and shocks. Work focused on development of algorithms which could be executed on parallel architectures and upon data structures and language constructs which allow this to be done efficiently and effectively. RICCATI EQUATION THEORY FOR PRITCHARD-SALAMON SYSTEMS: A POPOV FUNCTION APPROACH
M. Weiss 1994 67 p
(PB95-137089; W-9404) Avail: CASI HC A04/MF A01

In a 1993 paper by the author (PB94-125341), a general approach to Riccati equation theory was developed for infinite-dimensional systems with bounded input and output operators, extending the finite-dimensional theory in a 1993 paper by Ionescu and Weiss. This paper is a continuation of the first mentioned paper. The results in the cited paper are extended to a larger class of Riccati equations associated to systems with unbounded input and output operators in the so-called Pritchard-Salamon class and, in addition, some new applications of the Popov function approach are presented which are interesting even for the finite dimensional case. We explore numerical methods for solving multi-dimensional deconvolution and inverse scattering problems, and are particularly interested in techniques based on the singular value decomposition (SVD) to find low rank matrix approximations. Our emphasis will be on both speed and accuracy. We will develop new techniques for numerical multilinear algebra, in particular for computing the SVD of a compound matrix. We will investigate implementation on parallel hardware, and the actual prototyping of such designs. We will also study fault tolerance issues associated with such special-purpose VLSI processors, and develop methods to detect possible ill-conditioning of the underlying deconvolution problem. DTIC

A CONVERGENCE ANALYSIS OF AN h-VERSION FINITE ELEMENT METHOD WITH HIGH ORDER ELEMENTS FOR TWO DIMENSIONAL ELASTO-PLASTICITY PROBLEMS Final Report
Y. Li and I. Babuska Jan. 1994 44 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-90-1-1030; NSF DMS-91-20877)
(AD-A279975; BN-1162) Avail: CASI HC A03

In this paper, we will give an h-version finite element method for a two dimensional nonlinear elasto-plasticity problem. A family of admissible constitutive laws based on the so-called gauge function method is introduced first, and then a high order h-version semi-discretization scheme is presented. The existence and uniqueness of the solution for the semi-discrete problem are guaranteed by using some special properties of the constitutive law, and finally we will show that as the maximum element size h - 0, the solution of the semi-discrete problem will converge to the solution of the continuous problem. The high order h-version discretization scheme introduced here is unusual. If the partition of the spatial space only has rectangles or parallelograms involved, then there would not be any limit on the element degree. However, if the partition of the spatial space has some triangular elements, then only certain combinations of finite element spaces for displacement and stress functions can be used. The discretization scheme also provides useful idea for applications of hp-version or high order h-version finite element methods for two dimensional problems where the elasto-plastic body is not a polygon, such as a disk or an annulus. Petri nets have become a mature modeling and analysis tool applicable in many application domains. Many extensions of the classical Petri net have been proposed. The multi-dimensional Petri net model presented in this paper deals with these extensions in a unifying way. In this model an arbitrary number of dimensions may be identified, e.g. a 'spatial dimension', a 'time dimension', a 'color dimension', etc. This paper also discusses the relations between the multi-dimensional Petri net model and other Petri net based models. Multi-dimensional Petri nets can be analyzed using traditional techniques. Moreover, it is possible to project a multi-dimensional Petri net onto a limited number of dimensions. By analyzing the projected multi-dimensional Petri net we can deduce properties of the original multi-dimensional Petri net. Therefore, multi-dimensional Petri nets are also interesting from an analysis point of view. NTIS

Integral Transform methods play an extremely important role in many branches of science and engineering. The ease with which many problems may be solved using these techniques is well known. In Electrical Engineering especially, Laplace and Fourier Transforms have been used for a long time as a way to change the solution of differential equations into trivial algebraic manipulations or to provide alternate representations of signals and data. These techniques, while seemingly overshadowed by today's emphasis on digital analysis, still form an invaluable basis in the understanding of systems and circuits. A firm grasp of the practical aspects of these subjects provides valuable conceptual tools. This tutorial paper is a review of Laplace and Fourier Transforms from an applied perspective with an emphasis on engineering applications. The interrelationship of the time and frequency domains will be stressed, in an attempt to comfort those who, after living so much of their lives in the time domain, find thinking in the frequency domain disquieting. ERROR ANALYSIS OF THE QUADRATIC NODAL EXPANSION METHOD IN SLAB GEOMETRY
R. C. Penland (North Carolina State Univ., Raleigh, NC.), P. J. Turinsky, and Y. Y. Azmy (North Carolina State Univ., Raleigh, NC.) 1994 7 p Presented at the Winter Meeting of the American Nuclear Society, Washington, DC, 13-18 Nov. 1994
(Contract DE-AC05-84OR-21400)
(DE95-001352; CONF-941102-29) Avail: CASI HC A02/MF A01

As part of an effort to develop an adaptive mesh refinement strategy for use in state-of-the-art nodal diffusion codes, the authors derive error bounds on the solution variables of the quadratic Nodal Expansion Method (NEM) in slab geometry. Closure of the system is obtained through flux discontinuity relationships and boundary conditions. In order to verify the analysis presented, the authors compare the quadratic NEM to the analytic solution of a test problem. The test problem for this investigation is a one-dimensional slab (0,20cm) with L(exp 2) = 6.495sq cm and D = 0.1429cm. The slab has a unit neutron source distributed uniformly throughout and zero flux boundary conditions. The analytic solution to this problem is used to compute the node-average fluxes over a variety of meshes, and these are used to compute the NEM maximum error on each mesh. DOE

NUMERICAL WAVE SPEED FOR ONE-DIMENSIONAL SCALAR HYPERBOLIC CONSERVATION LAWS WITH SOURCE TERMS
A. C. Berkenbosch, E. F. Kaasschieter, and J. H. M. tenThijeBoonkamp Apr. 1994 34 p See also PB93-194801
(PB95-127536; RANA-94-01) Avail: Issuing Activity (National Technical Information Service (NTIS))

In this paper we consider initial value problems for scalar hyperbolic conservation laws in one space dimension, with source terms. The source terms admit at least two equilibrium states as solutions of the underlying characteristic equation, one unstable and one stable. An essential numerical difficulty for this initial value problem is that numerical reaction waves are propagating at non-physical wave speeds. In this paper we consider two types of model problems, namely the ignition model and the Arrhenius' model. Applications include reactive gas dynamics, where chemical reactions between the constituent gases need to be modeled along with the fluid dynamics. The numerical solution is computed with a first order splitting method. For this method a detailed analysis of the numerical wave speed is given. Expressions are derived for the numerical wave speed, which explain the occurrence of non-physical wave speeds. Furthermore, convergence of the numerical speed to the exact speed is shown. NTIS

SEMANTICS FOR A FINE LAMBDA-CALCULUS WITH DE BRUIJN INDICES
F. Kamareddine and R. Nederpelt 7 Sep. 1993 60 p Prepared in cooperation with Glasgow Univ.
(PB95-127577) Avail: Issuing Activity (National Technical Information Service (NTIS))

The authors' first task in the paper is to get rid of problematic variable names and to establish what they believe is the most precise and fine lambda-calculus, Omega(sub 11). In such a calculus, de Bruijn's indices are used instead of variable names and substitution and reduction are defined in a step-wise fashion which can be directly implemented without having to carry out a lot of book-keeping as is usually the case in the classical lambda-calculus. Most importantly, the substitution in Omega(sub 11) is no longer the implicit substitution but rather it is the explicit one which is long needed in many applications of the lambda-calculus. Such an explicit substitution has been facilitated as a result of the fine structure of lambda-terms that the authors propose in the paper and where item notation plays a dominant role. Furthermore, the species of variable names is cultivated and ordered so that a fine inter-marriage between de Bruijn's indices and variable names takes place. Such a relationship between de Bruijn's indices and variable names will be used to show the consistency of the authors' fine reduction and explicit substitution in terms of the classical lambda-calculus. The authors shall also reflect on the use and necessity of alpha-conversion. NTIS

ERROR COMMITTED BY STOPPING THE NEWTON ITERATION IN RUNGE-KUTTA METHODS AND LINEAR MULTISTEP METHODS

J. Groeneweg Nov. 1993 66 p
(PB95-106324; TW-93-13) Avail: Issuing Activity (National Technical Information Service (NTIS))

This paper concerns the numerical solution of stiff initial value problems, for nonlinear ordinary differential equations, by Runge-Kutta methods and linear multistep methods that are implicit. For stiff problems it is common practice to use Newton iteration, or a variant thereof, for solving the system of (algebraic) equations occurring in each time step of such step-by-step methods. In the recent literature the error committed by stopping the Newton-type iteration has been studied mainly theoretically. In the present paper we confirm the theoretical upperbounds for this error, to be found in the literature, by numerical experiments. In some of our experiments even smaller errors appear to be present than is to be expected according to the theory. NTIS

POSITIVE ROCKLAND OPERATORS
P. Auscher, A. F. M. terElst, and D. W. Robinson Aug. 1993 24 p Prepared in cooperation with Australian National Univ., Canberra, Australia
(PB95-127510; RANA-93-12) Avail: Issuing Activity (National Technical Information Service (NTIS))

Let G be a homogeneous Lie group with a left Haar measure dg and L the action of G as left translations on L(sub p)(G;dg). Further let H = dL(C) denote a homogeneous operator associated with L. If H is positive and hypoelliptic on L(sub 2) the authors prove that it is closed on each of the L(sub p)-spaces, p included in (1, infinity), and that it generates a semigroup S with a smooth kernel K which, with its derivatives, satisfies Gaussian bounds. The semigroup is holomorphic in the open right half-plane on all the L(sub p)-spaces, p included in (1, infinity). Further extensions of these results to non-homogeneous operators and general representations are also given. NTIS

DISTRIBUTION-INDEPENDENT HIERARCHICAL N-BODY METHODS Ph.D. Thesis
S. Aluru 27 Jul. 1994 89 p
(Contract W-7405-eng-82)
(DE95-001686; IS-T-1643) Avail: CASI HC A05/MF A01

The N-body problem is to simulate the motion of N particles under the influence of mutual force fields based on an inverse square law. The problem has applications in several domains including astrophysics, molecular dynamics, fluid dynamics, radiosity methods in computer graphics, and numerical complex analysis. Research efforts have focused on reducing the O(N(exp 2)) time per iteration required by the naive algorithm of computing each pairwise interaction. Widely respected among these are the Barnes-Hut and Greengard methods. Greengard claims his algorithm reduces the complexity to O(N) time per iteration. Throughout this thesis, we concentrate on rigorous, distribution-independent, worst-case analysis of the N-body methods. We show that Greengard's algorithm is not O(N), as claimed. Both Barnes-Hut and Greengard's methods depend on the same data structure, which we show is distribution-dependent. For the distribution that results in the smallest running time, we show that Greengard's algorithm is (Omega)(N log(exp 2) N) in two dimensions and (Omega)(N log(exp 4) N) in three dimensions. We have designed a hierarchical data structure whose size depends entirely upon the number of particles and is independent of the distribution of the particles. We show that both Greengard's and Barnes-Hut algorithms can be used in conjunction with this data structure to reduce their complexity. Apart from reducing the complexity of the Barnes-Hut algorithm, the data structure also permits more accurate error estimation. We present two- and three-dimensional algorithms for creating the data structure. The multipole method designed using this data structure has a complexity of O(N log N) in two dimensions and O(N log(exp 2) N) in three dimensions. DOE

APPROXIMATION ALGORITHMS FOR THE GENERAL AND THE ASYMMETRIC STACKER-CRANE PROBLEMS
G. Righini and M. Trubian Jun. 1994 55 p Prepared in cooperation with Politecnico di Milano, Italy
(PB95-132098; MEMO-COSOR-94-20) Avail: Issuing Activity (National Technical Information Service (NTIS))

The Stacker-Crane Problem (SCP) consists of finding the minimum length hamiltonian cycle on a mixed graph with oriented arcs and unoriented edges: feasible solutions must traverse all the arcs. Approximation algorithms are known for the case in which the triangle inequality holds. The authors consider the case in which the triangle inequality is violated (General SCP) and the case in which the problem is formulated on a complete digraph (Asymmetric SCP). They show how data-dependent worst-case bounds for the GSCP and the ASCP can be obtained by known approximation algorithms for the SCP with triangle inequality and by a new one. They also discuss the relationship with the Asymmetric Traveling Salesman Problem (ATSP), and they derive sufficient (and meaningful) conditions for ATSP instances to be solvable within constant worst-case bounds equal to 3, 15/7 and 9/5. Asymptotic analysis is used to derive preconditioners based on operator splitting and domain decomposition for the numerical solution of the advection-diffusion equation. Specifically, asymptotics is used to identify subdomains in which the solution is dominated by a certain operator, and this information is used to construct an effective preconditioner. The authors analyze the one-dimensional case in a function space setting and present numerical results for both one and two dimensions. DOE

ANALYSIS OF A LOCAL DEFECT CORRECTION APPROACH ON COMPOSITE GRIDS
P. J. J. Ferket Jun. 1994 30 p
(ISSN 0926-4507)
(PB95-135455; RANA-94-09) Avail: CASI HC A03/MF A01

In this paper we consider the problem of discretization on a composite grid that consist of a global uniform coarse grid and a local uniform fine grid. For elliptic problems a local defect correction approach is described. The error of the resulting approximation is analyzed. It follows that in general the accuracy of this approximation is (much) better than the accuracy of an approximation that results from an approach without local defect correction. The use of a buffer zone in the local defect correction approach appears to be essential for several problems. We discuss when such a buffer zone is necessary to obtain satisfactory results. NTIS

INTERNATIONAL CONFERENCE ON CONTROL AND ESTIMATION OF DISTRIBUTED PARAMETER SYSTEMS: NONLINEAR PHENOMENA

W. Desch, F. Kappel, and K. Kunisch 24 Jul. 1993 412 p Conference held in Vorau, Austria, 18-24 Jul. 1993
(AD-A286449) Avail: CASI HC A18/MF A04

This conference formed a platform for the exchange of new ideas and recent results in control, identification, and optimization of nonlinear infinite dimensional systems. It was designed to provide a melting pot for a broad variety of viewpoints, including theoretical aspects like the maximum principle, relaxation and stabilizability as well as numerical algorithms for optimization and applications to elastic structures, flow control, and population dynamics. Contents include: a semigroup formulation of a nonlinear size-structured distributed rate population model; damage detection and characterization in smart material structures; optimality conditions for nonqualified parabolic control problems; convergence of trajectories for a controlled viscous Burgers' equation; optimality conditions for boundary control problems of parabolic type; Pontryagin's principle for optimal control problems governed by semilinear elliptic equations; and invariance of the Hamiltonian in control problems for semilinear parabolic distributed parameter systems. GRID RESOLUTION AND SOLUTION CONVERGENCE FOR MARS PATHFINDER FOREBODY
Heather L. Nettelhorst and Robert A. Mitcheltree Dec. 1994 16 p
(RTOP 242-80-01-01)
(NASA-TM-109173; NAS 1.15:109173) Avail: CASI HC A03/MF A01

As part of the Discovery Program, NASA Plans to launch a series of probes to Mars. The Mars Pathfinder project is the first of this series with a scheduled Mars arrival in July 1997. The entry vehicle will perform a direct entry into the atmosphere and deliver a lander to the surface. Predicting the entry vehicle's flight performance and designing the forebody heatshield requires knowledge of the expected aerothermodynamic environment. Much of this knowledge can be obtained through computational fluid dynamic (CFD) analysis. Author

(PB95-108163; RAL-94-062) Avail: Issuing Activity (National Technical Information Service (NTIS))

This report covers the period from January 1991 to December 1993 and describes work performed by the Numerical Analysis Group within the Central Computing Department at the Atlas Center in the Rutherford Appleton Laboratory. The main research areas and interests lie in sparse matrix research, nonlinear algebra and optimization, applied mathematics, and numerical linear algebra. Work pertaining to these areas is discussed in Sections 2 to 5, respectively. We group some miscellaneous topics in Section 6. Much of our research and development results in high quality advanced mathematical software for the Harwell Subroutine Library. The organization, maintenance, documentation, and distribution of this Library is reported in Section 7. Lists of seminars, technical reports, and publications are given in Sections 8, 9, and 10, respectively. NTIS

(ISSN 0924-3755)
(PB95-134052; Memo-INF-94-30) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

The concept of dyad is defined as the least common generalization of monads and co-monads. So, taking some of the ingredients to be the identity, the concept specializes to the concept of monad, and taking other ingredients to be the identity it specializes to co-monads. Except for one axiom, all have a nice ('natural') form. NTIS

We present the category-theoretic notion of adjunction in a way that makes it easy to formally calculate with it; an acquaintance with its algebraic properties may greatly help in understanding the notion. It is illustrated by means of a lot of theorems and proofs. We also attempt to provide some intuitive understanding of adjunctions by various discussions. Our intended readership is familiar with the notion of category, functor, and naturality, and either about to learn about adjunctions or interested in a calculational approach to category theory. GRADED DUAL OF THE NON-COMMUTATIVE UNIVERSAL LEIBNIZ HOPF ALGEBRA ZETA
A. C. J. Scholtens Mar. 1994 69 p
(PB95-134532) Avail: CASI HC A04/MF A01

In the paper the authors consider the dual Z and the graded dual M of the universal Leibniz Hopf algebra Z = Z (less than) Z(sub 1), Z(sub 2),...(greater than) (i.e., the free associative (but non-commutative) algebra over Z on the set (Z(sub 1), Z(sub 2),...). The authors shall show that M = Z(EUW) as algebras, where Z(EUW) is the free polynomial ring over Z generated by the set EUW. P.B. Shay showed in his preprint that, without giving generic variables, Z is a formal power series ring over Z. Hence, it easily follows that M is a polynomial ring. The difficult part of proving the authors' statement is that they have to determine the set of (algebraically independent) generic variables, i.e. the set EUW. However, the corollaries to their main result are worth the effort. For instance, it immediately follows that Z is a non-commutative formal group law over Z. Another corollary is that they can give a Z-module basis for the primitive elements of Z. NTIS

LINEAR INVARIANCE OF LINDELOEF NUMBERS
Jan Baars and Helma Gladdines Mar. 1994 14 p
(PB95-134540) Avail: CASI HC A03/MF A01

Let X and Y be Tychonov spaces and suppose there exists a continuous linear bijection from C(sub P)(X) to C(sub p)(Y). In this paper the authors develop a method that enables them to compare the Lindelof number of Y with the Lindelof number of some dense subset Z of X. As a corollary the authors get that if for perfect spaces X and Y, C(sub p)(X) and C(sub p)(Y) are linearly homeomorphic, then the Lindelof numbers of X and Y are equal. Another result in the paper is the following. Let X and Y be any two zero dimensional metric spaces or any two linearly ordered perfect Tychonov spaces such that C(sub p)(X) and C(sub p)(Y) are linearly homeomorphic. Let P be a topological property that is closed hereditary, closed under taking countable unions and closed under taking continuous images. Then X has property P is and only if Y has. As examples of such properties the authors consider certain cardinal functions. NTIS

DUALITY BEYOND SOBER SPACES: TOPOLOGICAL SPACES AND OBSERVATION FRAMES
Marcello Bonsangue, Bart Jacobs (Utrecht State Univ., Netherlands.), and Joost N. Kok (Utrecht State Univ., Netherlands.) Jan. 1994 46 p
(PB95-134565) Avail: CASI HC A03/MF A01

The authors introduce observation frames as an extension of ordinary frames. The aim is to give an abstract representation of a mapping from observable predicates to all predicates of a specific system. A full subcategory of the category of observation frames is shown to be dual to the category of Tau(sub 0) topological spaces. This result extends the Stone duality between the full subcategory of spatial frames and sober spaces. Appropriate notions of filters, prime elements, and morphisms are introduced in order to construct points of observation frames. These notions generalize the standard ones. The authors also give a propositional logic of observation frames with both infinite conjunctions and disjunctions, just like there is a geometric logic for (ordinary) frames with infinite disjunctions but only finite conjunctions. This theory is then applied to two situations: firstly to upper power spaces, and secondly the authors restrict the adjunction between the categories of topological spaces and of observation frames in order to obtain dualities for various subcategories of Tau(sub 0) spaces. These involve non sober spaces. NTIS

EXPONENTS IN LIFETIME AND POWER SPECTRAL DENSITY FORMS IN SELF-ORGANIZED CRITICAL SYSTEMS Final Report

L. V. Meisel and P. J. Cote Aug. 1994 18 p
(AD-A286242; ARCCB-TR-94029) Avail: CASI HC A03/MF A01

Bak, Tang, and Weisenfeld (BTW) established that power-law frequency dependencies in the power spectral density (PSD) and size-effect modified power-law distributions of lifetimes are the fingerprints of self-organized critical systems. Jensen, Christensen, and Fogedby (JCF) clarified the ideas introduced by BTW and established the connection between the distribution of lifetimes and the PSD for the case of exponentially cutoff (size-effect modified) distributions of lifetimes. Here the (JCF) connection between the PSD and the distribution of lifetimes is established for sharp cutoff distributions, which supports the idea that the JCF connection holds for quite general size-effect modified lifetime distributions. The PSD may be expressed in terms of generalized hypergeometric functions in this case. A detailed discussion of the JCF connections is presented for a subset of values of the lifetime distribution exponent for which the generalized hypergeometric functions reduce to Fresnel integrals and sine and cosine integrals, which were the subject of a recent Numerical Recipes column. All calculations were performed in Mathematica. DTIC

MINIMAL SQUARE SPECTRAL FACTORS

A. C. M. Ran Jan. 1994 18 p
(PB95-132726) Avail: Issuing Activity (National Technical Information Service (NTIS))

Recently there has been renewed interest in the problem of spectral factorization and in particular, the problem of parametrizing all square minimal spectra factors of a given spectrum. For instance, let us mention two recent papers, one of which dealing with more computational aspects of the problem, the other giving a parametrization under additional constraints. The paper is motivated in a large part by the second paper, in fact the authors shall show that a parametrization similar to the one given there can be achieved without one of the additional constraints imposed in the second paper. A secondary aim of this paper is to give an overview of several parametrizations available in the literature. NTIS

ALMOST KAPPA-WISE INDEPENDENT RANDOM PERMUTATION OF THE CUBE

W. T. Gowers Jul. 1994 15 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB95-108098; IHES/M/94/43) Avail: CASI HC A03

In the paper the authors give a very simple construction which converts a random 01-string sigma of length polynomial in given integers n and k less than 2(sup n) into a permutation pi of the cube (0,1)(sup n), which looks random in the sense that, for any sequence x(1),..., x(k) of distinct points in (9,1)(sup n), the images phi(x(1)),..., phi(x(k)) are approximately uniformly distributed among the set of all k-tuples of distinct points in (0,1)(sup n). (The result is interesting mainly when k is small compared with 2(sup n).) It is likely that the permutation is pseudo-random in the technical sense in which case it is known to have applications. For example, it would then be the basis of an extremely secure private-key cryptosystem. The proof that the permutation is almost k-wise independent uses techniques due to Jerrum and Sinclar and Diaconis and Stroock concerning rapidly mixing Markov chains. NTIS

HAMILTONIAN STRUCTURE OF THE REVERSIBLE NONSEMISIMPLE 1:1 RESONANCE

J. C. vanderMeer, J. A. Sanders (Vrije Univ., Amsterdam, Netherlands.), and A. Vanderbauwhede (Ghent Univ., Belgium.) Apr. 1994 24 p
(ISSN 0926-4507)
(PB95-127528; RANA-94-02) Avail: CASI HC A03/MF A01

We show that a reversible non-Hamiltonian vector field at nonsemisimple 1:1 resonance can be split into a Hamiltonian and a non-Hamiltonian part in such a way that after reduction to the orbit space for the S(sup 1)-action coming from the semisimple part of the linearized vector field, the non-Hamiltonian part vanishes. As a consequence, the reduced reversible vector field is Hamiltonian. We furthermore show that for vector fields in normal form on the orbit space, being Hamiltonian is equivalent to being reversible. NTIS

ON THE WAVELET OPTIMIZED FINITE DIFFERENCE METHOD Final Report

Leland Jameson Mar. 1994 48 p Submitted for publication Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contracts NAS1-19480; RTOP 505-90-52-01; N00014-91-J-4016; AF-AFOSR-0090-93; NSF DMS-92-11820)
(NASA-CR-191601; ICASE-94-9; NAS 1.26:191601; AD-A279810) Avail: CASI HC A03

When one considers the effect in the physical space, Daubechies-based wavelet methods are equivalent to finite difference methods with grid refinement in regions of the domain where small scale structure exists. Adding a wavelet basis function at a given scale and location where one has a correspondingly large wavelet coefficient is, essentially, equivalent to adding a grid point, or two, at the same location and at a grid density which corresponds to the wavelet scale. This paper introduces a wavelet optimized finite difference method which is equivalent to a wavelet method in its multiresolution approach but which does not suffer from difficulties with nonlinear terms and boundary conditions, since all calculations are done in the physical space. With this method one can obtain an arbitrarily good approximation to a conservative difference method for solving nonlinear conservation laws. DTIC

ITERATED-SUBSPACE MINIMIZATION METHODS FOR NONLINEAR OPTIMIZATION

A. R. Conn, N. I. M. Gould, A. Sartenaer, and P. L. Toint Jun. 1994 31 p Prepared in cooperation with IBM Watson Research Center, Yorktown Heights, NY; Facultes Univ. Notre-Dame de la Paix, Namur, Belgium; and AFOSR, Bolling AFB, Washington, DC
(Contract F49620-91-C-0079)
(PB95-108171; RAL-94-069) Avail: Issuing Activity (National Technical Information Service (NTIS))

We consider a class of Iterated-Subspace Minimization (ISM) methods for solving large-scale unconstrained minimization problems. At each major iteration of such a method, a low-dimensional manifold, the iterated subspace, is constructed and an approximate minimizer of the objective function in this manifold then determined. The iterated subspace is chosen to contain vectors which ensure global convergence of the overall scheme and may also contain vectors which encourage fast asymptotic convergence. We demonstrate the efficiency of this approach on a collection of large problems and indicate a number of avenues of future research. NTIS

ON THE DYNAMICS OF A SHOCK-BUBBLE INTERACTION Final Report

James J. Quirk and Smadar Karni (New York Univ., New York, NY.) Sep. 1994 38 p Submitted for publication Sponsored in part by a Packard Fellowship
(Contracts NAS1-19480; RTOP 505-90-52-01; N00014-92-J-1245; DE-FG02-88ER-25053; NSF DMS-92-03768)
(NASA-CR-194978; NAS 1.26:194978; ICASE-94-75) Avail: CASI HC A03/MF A01

We present a detailed numerical study of the interaction of a weak shock wave with an isolated cylindrical gas inhomogenity. Such interactions have been studied experimentally in an attempt to elucidate the mechanisms whereby shock waves propagating through random media enhance mixing. Our study concentrates on the early phases of the interaction process which are dominated by repeated refractions of acoustic fronts at the bubble interface. Specifically, we have reproduced two of the experiments performed by Haas and Sturtevant : M(sub s) = 1.22 planar shock wave, moving through air, impinges on a cylindrical bubble which contains either helium or Refrigerant 22. These flows are modelled using the two-dimensional, compressible Euler equations for a two component fluid (air-helium or air-Refrigerant 22). Although simulations of shock wave phenomena are now fairly commonplace, they are mostly restricted to single component flows. Unfortunately, multi-component extensions of successful single component schemes often suffer from spurious oscillations which are generated at material interfaces. Here we avoid such problems by employing a novel, nonconservative shock-capturing scheme. In addition, we have utilized a sophisticated adaptive mesh refinement algorithm which enables extremely high resolution simulations to be performed relatively cheaply. Thus we have been able to reproduce numerically all the intricate mechanisms that were observed experimentally (e.g., transitions from regular to irregular refraction, cusp formation and shock wave focusing, multi-shock and Mach shock structures, jet formation, etc.), and we can now present an updated description for the dynamics of a shock-bubble interaction. TIME AND THE ORDER OF ABSTRACT EVENTS IN DISTRIBUTED COMPUTATIONS

Twan Basten, Thomas Kunz (Technische Univ., Darmstadt, Germany.), James Black (Waterloo Univ., Ontario.), Michael Coffin (Waterloo Univ., Ontario.), and David Taylor (Waterloo Univ., Ontario.) Feb. 1994 40 p Prepared in cooperation with Waterloo Univ., Ontario

(PB95-110482) Avail: CASI HC A03/MF A01

An important problem in event-based models of distributed computations is the amount of behavioral information. Even for simple applications, the number of events is large and the causal structure is complex. Event abstraction can be used to reduce the apparent complexity of a distributed computation. The paper discusses one important aspect of event abstraction: causality among abstract events. Logical vector time and a derived notion called reversed vector time can be used to assign two meaningful timestamps to abstract events. These timestamps can be used to efficiently determine causal relationships between arbitrary abstract events. The class of convex abstract events is identified as a subclass of abstract events that is general enough to be widely applicable and restricted enough to simplify timestamping. For this class, ordinary vector time is sufficient to determine causal relationships. At the cost of some extra computational effort, the timestamps derived for convex abstract events can also be used for arbitrary abstract events, overcoming the need for reversed timestamping. NTIS

MAXIMUM WEIGHTED MATCHING FOR HIGH INDEX DIFFERENTIAL ALGEBRAIC EQUATIONS Thesis

P. Bujakiewicz 1 Apr. 1993 168 p

(PB95-135075; ISBN-90-9007240-3) Avail: Issuing Activity (National Technical Information Service (NTIS))

This thesis is the result of a research which originally started in the area of modelling of combined continuous/discrete-event systems. In chapter 2, some aspects from the theory of DAE's are briefly described. In chapter 3, the numerical solution of DAE's by the BDF method is described. In section 3.8, recent results on the stability of the numerical solution of high index DAE's are summarized. In chapter 4, some classical graph algorithms which we use in chapter 5, are presented. In chapter 5, the article is presented in which we propose the algorithm for determining powers of s in structurally high index DAE's. In chapter 6, simulation results are presented, where the modifications from section 3.7 are applied. These modifications use the knowledge of powers of s determined by the algorithm developed in chapter 5. NTIS

RIGHT INVERSE FOR THE DIVERGENCE OPERATOR IN SPACES OF CONTINUOUS PIECEWISE POLYNOMIALS Research Report

E. Boillat May 1994 19 p See also AD-A136889

(PB95-127080) Avail: CASI HC A03/MF A01

The paper is concerned with the norm of a right inverse for the divergence operator between spaces of piecewise polynomials on triangular elements. More specifically, one tries to construct a right inverse acting from the space W of continuous piecewise polynomials of degree p into the space V of R(exp 2) - valued piecewise polynomials of degree p + 1. Under the hypothesis of quasiuniformity of the triangulation, one proves that this right inverse has an operator norm which grows at most like square root of (ln p) when both W and V are equipped with the H(exp 1) - norm and at most like p(exp 2) square root of (ln p) if W is equipped with the L(exp 2) - norm only. An application of the first of these two results is the approximation of the thermoelasticity equations by the p-version of the finite element methods. One also shows how the second result can be used in the context of higher-order Hood-Taylor method for the Stokes problem. NTIS

LOCKING OF THE FINITE ELEMENT METHOD IN THERMOELASTICITY Research Report

E. Boillat May 1994 20 p See also AD-A187902

(PB95-127098) Avail: CASI HC A03/MF A01

The paper is concerned with the solution mu to the stationary problem of thermoelasticity and with the approximation mu(sub n) of u obtained with a standard Galerkin method. In the incompressible limit, when the Lame coefficient lambda becomes infinite, mu(sub n) is subject to a divergence constraint, div mu(sub n) = P(sub n)T, where Pn is a given approximation operator acting on the temperature field T. This mechanism provokes a locking phenomenon similar to the one observed in elasticity and studied by Babuska and Suri in another paper. The purpose of the work is to give a sufficient and necessary condition on the discrete spaces V(sub n), used in the Galerkin formulation, to avoid locking and get an estimation of the error which is optimal and independant of lambda. The criterion will be used to construct two practical examples of methods free from locking for the usual thermoelasticity problem where the temperature field is solution of a Poisson equation. The first example is based on the h-version of the finite element method, the second one on the p-version. NTIS

SELF-SIMILAR SOLUTIONS OF A FAST DIFFUSION EQUATION THAT DO NOT CONSERVE MASS
Mark A. Peletier and Hongfei Zhang 1994 26 p
(ISSN 0922-5641)
(PB95-134920) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

The equation u(sub t) = del(vector differential operator) dot (u(sup -n)del(vector differential operator)u) (1.1) arises in many areas of applications. The case n = 0 corresponds to the classical heat conduction equation. When n is less than 0, the equation models the flow of a gas in a porous medium. Because the diffusion coefficient u(sup -n) vanishes when u = 0, disturbances of u = 0 propagate at finite speed. Therefore (1.1) with n less than 0 is also known as the slow diffusion equation, and has been the focus of extensive study during the past two decades. In this paper the authors consider the solutions in the case of fast diffusion, i.e. n greater than 0. The authors shall consider equation (1.1) in R(sup N), for a spatial dimension N larger than two, subject to an initial condition u(x,0) = u(sub 0)(x) for x (is a member of) R(sup N) where the initial distribution u(sub 0) is non-negative and u(sub 0)(is a member of) L(sup 1)(R sup N). In particular the authors take N greater than 2 and 2/N less than n less than 1, and seek solutions u of (1.1) which vanish at a finite time T. NTIS

FORTRAN SUBROUTINE FOR COLUMN REDUCTION OF POLYNOMIAL MATRICES
A. J. Geurts and C. Praagman (Groningen Rijksuniv., Netherlands.) Jun. 1994 74 p
(ISSN 0167-9708)
(PB95-134987; EUT-94-WSK-01) Avail: CASI HC A04/MF A01

In this report we describe a subroutine that takes an arbitrary polynomial matrix P as input, and yields on output a unimodular polynomial matrix U and a column reduced polynomial matrix R such that PU = R. The subroutine was run on four different computers, with comparable results. We found examples in which the routine behaves well, as well as examples in which the routine performs poorly, if no precautions are taken. We provide both kinds of examples and discuss the cause of the behavior of the routine. From these considerations a guideline for the use of the routine is derived. NTIS

POLLUTION ERROR IN THE H-VERSION OF THE FINITE ELEMENT METHOD AND THE LOCAL QUALITY OF A-POSTERIORI ERROR ESTIMATORS Final Report
I. Babuska, T. Strouboulis (Texas A&M Univ., College Station, TX.), C. S. Upadhyay (Texas A&M Univ., College Station, TX.), and A. Mathur (Texas A&M Univ., College Station, TX.) Feb. 1994 161 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-90-J-1030; NSF CCR-88-20279; NSF MSS-90-25110)
(AD-A279868; BN-1163; CMC-94-01) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

In this work we study the pollution-error in the h-version of the finite element method and its effect on the local quality of a-posteriori error estimators. We show that the pollution-effect in an interior subdomain depends on the relationship between the mesh inside and outside the subdomain and the smoothness of the exact solution. We also demonstrate that it is possible to guarantee the quality of local error-estimators in the interior of a finite-element mesh-patch of interest by employing meshes which are sufficiently refined outside the patch. APPLICATION OF MARKOV DECISION PROCESSES TO SEARCH PROBLEMS
Leo B. Hartman (Waterloo Univ., Ontario.) and Kees M. vanHee (Waterloo Univ., Ontario.) Jan. 1994 34 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB95-110813) Avail: CASI HC A03

In the paper the authors show how Markov decision processes can be used to guide a random search process. The authors first formulate search problems as a special class of Markov decision processes such that the search space of a search problem is the state space of the Markov decision process. In general it is not possible to compute an optimal control procedure for these Markov decision processes in a reasonable time. The authors, therefore, define several simplifications of the original problem that have much smaller state spaces. For these simplifications, decompositions and abstractions, the authors find optimal strategies and use the exact solutions of these simplified problems to guide a randomized search process. The search process selects states for further search at random with probabilities based on the optimal strategies of the simplified problems. These randomized search procedures are repeated as long as the authors have time to solve the problem. The authors illustrate the approach with two examples: the N-puzzle and job shop scheduling problem. NTIS

FREQUENT SAMPLING IN DISCRETE CHOICE
M. R. Jaiebi 1994 22 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB95-110961; FEW-618) Avail: CASI HC A03

We analyze a discrete choice model based on random utility maximization involving frequent sampling, without restrictions on the stochastic structure (admitting dependence). For large samples, we calculate the (limiting) choice probabilities. They are hit for any size of the sample if and only if the invariance of achieved utility property holds. Examples are the Multinomial Logit model and the Generalized Extreme Value model. NTIS

A MULTIVARIATE MULTISAMPLE RANK TEST FOR STOCHASTIC SIMULATION VALIDATION Final Report, 1 Oct. 1993 - 31 May 1994
Ann E. Brodeen and Malcolm S. Taylor Oct. 1994 36 p
(AD-A285922; ARL-TR-592) Avail: CASI HC A03/MF A01

Nonparametric multivariate statistical methods address a broad class of problems in data analysis in which the assumption of normality is not feasible, and where the data occur naturally as n-tuples (vectors) rather than scalar values. This is the data structure that is most common in the engineering sciences and, coincidentally, the least tractable. A computer-intensive approach to the analysis of these data, usually referred to as randomization or permutation procedures, will be the specific focus of this work. Tests based on permutations of observations are nonparametric tests. This study considers a multivariate extension of the well-known Kruskal-Wallis rank sum test as a method for hypothesis testing, a technique commonly employed for simulation validation. The test statistic investigated is a nonparametric analogue of the classical Hotelling T2 used for the normal theory model. This undertaking is part of a broader based Army research program, the goal of which is to improve the ability of communications networks to deliver critical information on the battlefield when and where it is needed, despite a rapidly changing and often hostile environment. It will also support the ongoing effort to formalize the validation process for network simulation that, in turn, provides the groundwork for exploring alternatives and testing hypotheses throughout the research program. This formalization of the validation process can be readily transmitted to other organizations that rely on network simulations for their analyses. DTIC

ITERATED-BOOTSTRAP CONFIDENCE INTERVALS FOR THE MEAN Special Report
R. R. Stanny 20 Dec. 1993 13 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A279802; NAMRL-SP-93-6) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Several reports indicate that nonparametric bootstrap confidence intervals (CI's) produced by the percentile method can yield overly liberal Type I error rates in small samples when the nominal alpha level is .05 or less. In the Monte Carlo simulations described here, percentile-method bootstrap 95% CI's for mu produced higher Type I error rates than standard parametric CI's in Gaussian and exponential samples of 40 or fewer observations. Iterated-bootstrap CI's for mu, however, yielded Type I error rates near alpha = .05 in Gaussian and exponential samples of as few as 10 observations. In exponential samples of 10 or more observations, iterated-bootstrap intervals controlled Type I errors more reliably than parametric intervals and were not obviously inferior to the parametric intervals when the data were Gaussian. Thus, ordinary percentile-method bootstrap CI's for mu may be of questionable accuracy when Type I error rates are to be controlled at values of alpha less than or equal .05 or so. On the other hand, iterated-bootstrap CI's may be preferable to parametric CI's for data that come from a skewed distribution, such as the exponential, provided n is 10 or more. In samples of about 10 observations or more, iterated CI's may yield better Type I error control than parametric CI's when the data are skewed and nearly the same Type I error control when the data are Gaussian. ON COMMONALITIES IN SIGNAL DESIGN FOR NON-GAUSSIAN CHANNELS Final Report
Nhi-Anh Chu, Nirmal Warke (George Mason Univ., Fairfax, VA.), and Geoffrey C. Orsak (George Mason Univ., Fairfax, VA.) 26 Aug. 1994 46 p
(AD-A285385; NRL/FR/5591-94-9735) Avail: CASI HC A03/MF A01

We derive for additive non-Gaussian white noise channels signal waveforms that are simultaneously optimal with respect to the minimum probability of error, the mini-max, and the Neyman-Pearson criteria. We show that for a large class of non-Gaussian statistics, there exist only two asymptotically optimal signal waveforms; one impulsive while the other is constant in amplitude. The impulsive waveform is optimal when the tails of the noise density fall off faster than the tails of the Gaussian density. We show that under each of the three optimality criteria the asymptotic performance for small signals is essentially determined by the signal energy, while for large signals the performance is determined by a non-Euclidean metric that varies with respect to the tails of the noise density function. To support these results, we offer simulations for a variety of non-Gaussian channels. In each case, the asymptotic theory holds strikingly well even for decidedly nonasymptotic regimes. DTIC

ERROR PROBABILITIES OF FFH/BFSK WITH NOISE NORMALIZATION AND SOFT DECISION VITERBI DECODING IN A FADING CHANNEL WITH PARTIAL-BAND JAMMING M.S. Thesis
Anthony Y. Chua Mar. 1994 75 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A280041) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

An error probability analysis of a communications link employing convolutional coding with soft decision Viterbi decoding implemented on a fast frequency-hopped, binary frequency-shift keying (FFH/BFSK) spread spectrum system is performed. The signal is transmitted through a frequency nonselective, slowly fading channel with partial-band jamming. Noise normalization combining is employed at the receiver to alleviate the effects of partial-band jamming. The received signal amplitude of each hop is modeled as a Rician process, and each hop is assumed to fade independently. It is found that with the implementation of soft decision Viterbi decoding that the performance of the receiver is improved dramatically when the coded bit energy to partial-band noise power spectral density ratio (E(sub b)/N(sub 1)) is greater than 10dB. At higher E(sub b)/N(sub 1), the asymptotic error improves dramatically and varies from 10(exp -6) to 10(exp -12) depending on the constraint length (v), number of hops/bit (L), and the strength of the direct signal (alpha sq/(2 alpha)sq). In addition, nearly worst case jamming occurs when the jammer uses a full band jamming strategy, even when L = 1 and there is a very strong direct signal (alpha sq/(2 alpha)sq) = 100).Due to noncoherent combining losses, when the hopper bit ratio is increased, there is some degradation at moderate E(sub b)/N(sub 1). Furthermore, when a stronger code is used (i.e., the constraint length is longer), performance improves, especially for high E(sub b)/N(sub 1) where the asymptotic error is reduced. Finally, soft decision decoding improves performance over hard decision decoding from 4 to 8 dB at moderate E(sub b)/N(sub 1) depending on the code rate and with a much lower asymptotic error at high E(sub b)/N(sub 1). NONPARAMETRIC ESTIMATION OF THE CYCLIC CROSS-SPECTRUM Final Report, Jan. - May 1994
Brian Sadler Oct. 1994 19 p
(AD-A285756; ARL-TR-464) Avail: CASI HC A03/MF A01

Cyclostationary processes are an important class of nonstationary processes. In this report we consider nonparametric estimation of the cyclic cross-spectrum. A periodogram-based estimator is studied and its asymptotic behavior characterized. This extends the recent univariate work of Dandawate and Giannakis to the multivariate case. The results are useful for a variety of multi-sensor cyclostationary signal processing scenarios, such as bearing estimation. DTIC

ON MARKOV CHAIN MONTE CARLO ACCELERATION
Alan E. Gelfand and Sujit K. Sahu 4 Apr. 1994 24 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-92-J-1264)
(AD-A279393; SU-TR-480) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Markov chain Monte Carlo (MCMC) methods are currently enjoying a surge of interest within the statistical community. The goal of this work is to formalize and support two distinct adaptive strategies which typically accelerate the convergence of a MCMC algorithm. One approach is through resampling; the other incorporates adaptive switching of the transition kernel. Support is both by analytic arguments and simulation study. Application is envisioned in low dimensional but non-trivial problems. Two pathological illustrations are presented. Connections with reparametrization are discussed as well as possible difficulties with infinitely often adaptation. DTIC

BAYESIAN ANALYSIS OF SEMIPARAMETRIC PROPORTIONAL HAZARDS MODELS
Alan E. Gelfand and Bani K. Mallick 21 Mar. 1994 24 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-92-J-1264)
(AD-A279394; SU-TR-479) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

We consider the usual proportional hazards model in the case where the baseline hazard, the covariate link and the covariate coefficients are all unknown. Both the baseline hazard and the covariate link are monotone functions and are characterized nonparametrically using a dense class arising as a mixture of Beta distribution functions. We take a Bayesian approach for fitting such a model. Since interest focuses more upon the likelihood, we consider vague prior specifications including Jeffreys's prior. Computations are carried out using sampling-based methods. Model criticism is also discussed. Finally, a data set studying survival of a sample of lung cancer patients is analyzed. DTIC

PRECEDENCE TESTS AND CONFIDENCE BOUNDS FOR COMPLETE DATA: AN OVERVIEW AND SOME RESULTS
S. Chakraborti (Alabama Univ., Tuscaloosa, AL.) and P. vanderLaan Jun. 1994 40 p
(Grant NATO-CRG-920287) (ISSN 0926-4493)
(PB95-132668; Memo-COSOR-94-19) Avail: CASI HC A03/MF A01

An overview of some nonparametric procedures based on precedence (or exceedance) statistics is given. The procedures include both tests and confidence intervals. In particular, the construction of some simple distribution-free confidence bounds for location difference of two distributions with the same shape is considered and some properties are derived. The asymptotic relative efficiency of an asymptotic form of the corresponding test relative to Wilcoxon's two-sample rank-sum test and the two-sample Student's t-test is given for various cases. Some K-sample problems are discussed where precedence type tests are useful, along with a review of the literature. NTIS

ASYMPTOTIC ANALYSIS OF NASH EQUILIBRIA IN NONZERO-SUM LINEAR-QUADRATIC DIFFERENTIAL GAMES. THE TWO-PLAYER CASE
A. J. T. M. Weeren, J. M. Schumacher, and J. C. Engwerda 1994 37 p
(PB95-111027; FEW-634) Avail: CASI HC A03/MF A01

In the paper the authors discuss nonzero-sum linear-quadratic differential games. The Nash equilibria for different kinds of information structures were previously studied. Most of the literature on the topic of nonzero-sum linear-quadratic differential games is concerned with games of fixed (finite) duration, i.e. the games are studied over a finite time horizon t(sub f). The authors will study the behavior of Nash equilibria for t(sub f) approaches infinity for two different information structures, the open-loop and the closed-loop perfect state information. In the open-loop case, it is known that the coupled Riccati differential equations describing the Nash equilibrium can be related to alinear dynamical system. Using this linear system, asymptotic properties of the open-loop Nash equilibrium are studied. In the case of closed-loop perfect state information, they will study the so-called feedback Nash equilibrium. The authors show that there exist choices of parameters, for which the asymptotic behavior of the solutions of the Riccati equations depends strongly on the specified terminal values. Finally, they show that, although the feedback Nash equilibrium over any fixed finite horizon is unique, there can exist several different feedback Nash equilibria in stationary strategies for the infinite horizon problem, even when they restrict their attention to Nash equilibria that are stable in the dynamical sense of the word. NOTE ON THE CHARACTERIZATIONS OF THE COMPROMISE VALUE
G. J. Otten, P. Borm, and S. Tijs May 1994 28 p
(PB95-135117; FEW-655) Avail: Issuing Activity (National Technical Information Service (NTIS))

The compromise value was previously introduced as a solution concept on the class of compromise admissible non-transferable utility (NTU) games. Two characterizations of the compromise value are provided on sub-classes of NTU-games. This note shows that in one of these characterizations the axioms are dependent. It turns out that with a small weakening of the symmetry property the axioms become independent. Moreover, a new characterization of the compromise value is provided. Further, it is shown that these characterizations can be extended to a larger class of NTU-games. Finally, all monotonic, Pareto optimal, and covariant values on the class of NTU-games are described. EXPLICIT ANALYTICAL SOLUTION OF THE NONLINEAR VLASOV POISSON SYSTEM
V. Skarka, S. M. Mahajan, and E. Fijalkow (Centre National de la Recherche Scientifique, Orleans, France.) Oct. 1993 32 p
(DE94-628931; IC-93/339) Avail: CASI HC A03/MF A01 (US Sales Only)

In order to describe the time evolution of an inhomogeneous collisionless plasma the nonlinear Vlasov equation is solved perturbatively, using the subdynamics approach and the diagrammatic techniques. The solution is given in terms of a double perturbation series, one with respect to the nonlinearities and the other with respect to the interaction between particles. The infinite sum of interaction terms can be performed exactly due to the property of dynamical factorization. Following the methodology, the exact solution in each order with respect to nonlinearities is computed. For a choice of initial perturbation the first order exact solution is numerically integrated in order to find the local density excess. The approximate analytical solution is found to be in excellent agreement with exact numerical integration as well as with ab initio numerical simulations. Analytical computation gives a better insight into the problem and it has the advantage to be simpler, and also accessible in some range of parameters where it is difficult to find numerical solutions. N=1 SUPERCONFORMAL MINIMAL MODEL CORRELATION FUNCTIONS ON THE TORUS
A. Abdurrahman, F. Anton, M. A. Namazie, and C. Nunez Dec. 1993 64 p Prepared in cooperation with Rome Univ., Italy and Oxford Univ., Oxford, England
(PB95-134615; RAL-94-057) Avail: Issuing Activity (National Technical Information Service (NTIS))

The Coulomb gas formalism is employed to construct contour integral representations of two-point correlation functions on the torus for the N = 1 superconformal unitary discrete series, characterized by the single integer p. (For the particular case of the Tricritical Ising Model, these include the energy and vacancy density operators.) Modular and monodromy properties of the superconformal blocks are examined and the generalization to superconformal theories of Verlinde's results on modular transformations and the fusion algebra discussed in some detail. For p odd, the relevant modular matrix is (with respect to a particular basis) symmetric and unitary, as in ordinary rational conformal theory. However, for p even, there appears to be an obstruction due to the Ramond vacuum state. NTIS

DESIGN AND THERMAL STRESS ANALYSIS OF HIGH POWER X-RAY MONOCHROMATORS COOLED WITH LIQUID NITROGEN
C. S. Rogers and L. Assoufid Jul. 1994 14 p Presented at the International Meeting on Synchrotron Radiation Instrumentation, Stony Brook, NY, 18-22 Jul. 1994
(Contract W-31-109-eng-38)
(DE94-016879; ANL/XFD/CP-82667; CONF-940714-9) Avail: CASI HC A03/MF A01

Cryogenically cooled, single-crystal silicon, x-ray monochromators offer much better thermal performance than room-temperature silicon monochromators. The improved performance can be quantified by a figure-of-merit equal to the ratio of the thermal conductivity to the coefficient of thermal expansion. This ratio increases by about a factor of 50 as the temperature is decreased from 300 K to 100 K. An extensive thermal and structural finite element analysis is presented for an inclined, liquid nitrogen cooled, Si monochromator crystal diffracting 4.2 keV photons from the (111) planes using Undulator A at the Advanced Photon Source. The angular size of the beam accepted on the crystal was chosen to be 50 (mu)rad vertically and 120 (mu)rad horizontally. The deflection parameter, K, was 2.17 for all cases. The peak power density at normal incidence to the beam was calculated to be 139 W/mm(exp 2), and the total power was 750 W at a distance of 30 m from the source for a positron current of 100 mA. The crystal was oriented in the inclined geometry with an inclination angle of 85 degrees for all cases. The performance of the crystal was investigated for beam currents of 100, 200, and 300 mA. The calculated peak slopes of the diffraction plane over the extent of the beam footprint were -1.17, -2.35, and 0.33 (mu)rad, and the peak temperatures were 88.2, 102.6, and 121.4 K, respectively. The variation in the Bragg angle due to change in d-spacing across the beam footprint was less than 1 (mu)rad for all cases. These results indicate that a properly designed, cryogenically cooled, inclined silicon monochromator can deliver the full brilliance of Undulator A at even the highest machine currents. DOE

GIANT MAGNETORESISTANCE CALCULATED FROM FIRST PRINCIPLES
W. H. Butler, J. M. MacLaren (Tulane Univ., New Orleans, LA.), and X. G. Zhang (Kentucky Univ., Lexington, KY.) 1994 2 p Presented at the Spring Meeting of the Materials Research Society, San Francisco, CA, 12-16 Apr. 1993
(Contract DE-AC05-84OR-21400)
(DE94-018658; CONF-930405-58) Avail: CASI HC A01/MF A01

The Layer Korringa Kohn Rostoker-Coherent Potential Approximation technique was used to calculate the low temperature giant magnetoresistance (GMR) from first principles for Co (vertical bar) Cu and permalloy (vertical bar) Cu superlattices. Our calculations predict large giant magnetoresistance ratios for Co (vertical bar) Cu and extremely large ratios for permalloy (vertical bar) Cu for current perpendicular to the layers. Mechanisms such as spin-orbit coupling which mix spin channels are expected to greatly reduce the GMR effect for permalloy (vertical bar) Cu. DOE

POWER-LAW RESISTIVITY, MAGNETIC RELAXATION AND AC SUSCEPTIBILITY

J. Gilchrist (Centre National de la Recherche Scientifique, Grenoble, France.) and C. J. vanderBeek Jul. 1994 3 p Presented at the Meeting on Materials and Mechanisms of Superconductivity: High Temperature Superconductors, Grenoble, 4-9 Jul. 1994
(Contract W-31-109-eng-38)
(DE94-016893; ANL/MSD/CP-83799; CONF-940701-18) Avail: CASI HC A01/MF A01

The nonlinear diffusion of magnetic flux into a superconducting sample can be studied by measuring the relaxation of the magnetization after application of a step field or by measuring the ac susceptibility, chi(sub 1) and its third harmonic, chi(sub 3), or preferably both methods covering different time scales. Each has been analyzed recently for a field-cooled sample of a material whose creep activation energy depends logarithmically on current density, J corresponding to a power-law relation between electric field, E and J. Here, results are compared, using a universal scaling depth. Maximum chi(sub 1)'' and absolute value of chi(sub 3) values occur, and also the magnetization has relaxed to half its initial value when the scaling depth is comparable to the sample half-thickness. MAGNETIC FLOCCULATION OF PARAMAGNETIC PARTICLES

C. Tsouris and T. C. Scott 1994 7 p Presented at the Summer Meeting of the American Institute of Chemical Engineers, Denver, CO, 14-17 Aug. 1994
(Contract DE-AC05-84OR-21400)
(DE94-018144; CONF-940853-9) Avail: CASI HC A02/MF A01

An experimental apparatus has been assembled for the flocculation study of paramagnetic particles under the influence of a strong magnetic field. A magnetic field of strength up to 6 T is generated by a cryogenic magnet operating near liquid helium temperatures. Experimental information is obtained from fluctuation and intensity measurements of light passing through a particle suspension located in a uniform magnetic field. Particle flocculation is described by a Brownian flocculation model in which hydrodynamic, van der Waals, double-layer, and magnetic forces are incorporated for the estimation of the particle flocculation rate. A population-balance model is employed in conjunction with the flocculation model to predict the evolution of the particle size and composition or magnetic susceptibility with time. The effects of magnetic-field strength, magnetic susceptibility of the particles, particle size, and zeta potential are investigated. Results show that particle size and magnetic susceptibility each play an important role in the selective flocculation of particles of different properties. DOE

ION HEATING PERPENDICULAR TO THE MAGNETIC FIELD

Mats Andre and Tom Chang 28 Mar. 1994 41 p
(Contract F19628-91-K-0043)
(AD-A286635; PL-TR-94-2139; SR-2) Avail: CASI HC A03/MF A01

Several theories of ion heating perpendicular to the geomagnetic field are briefly reviewed and assessed. Perpendicular heating of ions leading to the formation of ion conics is common in the ionosphere and magnetosphere. Ion conics at altitudes above a few thousand kilometers are often associated with waves around the ion gyrofrequency. It is concluded that the majority of these ion conics that are locally heated or generated over extended altitude regimes, may be best explained by ion cyclotron resonance heating. At lower altitudes, particularly in the region of discrete auroras, energization by turbulence around the lower hybrid frequency seems to be an important heating mechanism. DTIC

ON THE TAYLOR TEST. PART 3: A CONTINUUM MECHANICS CODE ANALYSIS OF STEADY PLASTIC WAVE PROPAGATION

P. J. Maudlin, J. C. Foster, Jr. (Wright Lab., Eglin AFB, FL.), and S. E. Jones (Alabama Univ., Tuscaloosa, AL.) Nov. 1994 42 p
(Contract W-7405-eng-36)
(DE95-002252; LA-12836-MS) Avail: CASI HC A03/MF A01

Simple conservation relationships ('Jump' conditions) in conjunction with postulated material constitutive behavior are applied to steady plastic strain waves propagating in problems of uniaxial stress and Taylor Cylinder Impact. These problems are simulated with a two-dimensional Lagrangian continuum mechanics code for numerically validating the Jump relationships as an accurate analytical representation of plastic wave propagation. The constitutive behavior used in this effort assumes isotropy and models the thermodynamic response with a Mie-Grunisen Equation-of-State and the mechanical response with the rate-dependent Johnson-Cook and MTS flow stress models. The Jump relationships successfully replicate the results produced by continuum code simulations of plastic wave propagation and provide a methodology for constructing mechanical constitutive models from experimental plastic wave speed information. Comparisons are also presented between experimental speeds from Taylor Cylinder Impact tests with Jump relationships and continuum code predictions, indicating that the above mentioned flow stress models may not accurately capture plastic wave propagation speeds in annealed and hardened copper. CORRELATED WAVEFUNCTION MONTE CARLO STUDIES OF EXCITATIONS IN THE QUANTUM HALL LIQUIDS

Balazs Kralik, Andrew M. Rappe, and Steven G. Louie Aug. 1994 4 p Presented at the 22th International Conference on Physics of Semiconductors, Vancouver, British Columbia, 15-19 Aug. 1994
(Contract DE-AC03-76SF-00098)
(DE95-002337; LBL-36063; CONF-9408155-10) Avail: CASI HC A01/MF A01

Various excitations in the quantum Hall liquid at different Landau level filling factors are studied using a variational quantum Monte Carlo approach. Quantities calculated include spin-flip energies and dispersion relations for the collective modes (the magnetorotons and magnetoplasmons). The present approach goes beyond the lowest-Landau-level and single-mode approximations commonly used in previous studies. The inclusion of Landau-level mixing along with finite-thickness and donor effects satisfactorily explains values for the (nu) = 1 spin-flip energy that are found in recent photoluminescence experiments on (delta)-doped samples. In the case of the magnetorotons at (nu) = 1/3, the authors show that multiple-mode effects can change the excitation energies significantly, especially for high r(sub s) samples (by nearly 50% at r(sub s) = 20). STUDY OF IMPROVED CRITICAL CURRENTS AND MECHANICAL PROPERTIES IN THE Y-Ba-Cu-O SUPERCONDUCTOR WITH SILVER OR Y2BaCuO3 OR 211 DISPERSIONS Final Report, 1 Apr. 1992 - 31 Aug. 1994
Siu-Wai Chan Aug. 1994 93 p
(Contract F49620-92-J-0160)
(AD-A285609; AFOSR-94-0651TR) Avail: CASI HC A05/MF A01

The microstructure of the top-seeded, single grain, melted textured YBCO materials with different vol% 211 were investigated. The homogeneity of 211 distribution was greatly improved by using a solution precipitated 211 powder in preparation. Crack spacings and twin spacings were found to decrease with increasing vol% of the 211 particles. The 211 particles were found to be effective in holding crack propagation. Relationship between twin spacing and interparticle spacing was found to depend on the elastic strain energy from the tetragonal to orthorhombic transformation. The accumulative beneficial effects of the 211 addition on Jc are summarized. The highest Jc was 10(exp 4) A/sq cm at 77K 1T. Our transmission electron microscopy of the Au/YBCO interfaces shows well-bonded interfaces with no extraneous phases present with the (001) lattice fringe of YBCO terminated at the interfaces abruptly. Both integral steps of (001) height and multiples of 1/3(001) steps were observed. Our finding supports earlier contact resistivity and XPS results of the Au/YBCO interfaces. Amorphous carbon films were shown to protect superconducting YBCO films from degradation by humidity. The YBCO films with carbon coating were founded to retain critical current densities 4 orders of magnitude higher than the uncoated YBCO films after 2h at 100% relative humidity stressing at room temperature. THEORY OF SPIN DYNAMICS IN THE CLASSICAL TWO-DIMENSIONAL HEISENBERG MAGNET
S. W. Lovesay, E. Engdahl, A. Cuccoli, and V. Tognetti Jun. 1994 29 p See also PB92-200203 Prepared in cooperation with Florence Univ., Italy
(PB95-133559; RAL-94-067) Avail: Issuing Activity (National Technical Information Service (NTIS))

The wave vector-dependent spin autocorrelation function of a classical Heisenberg model on a square lattice is calculated from the coupled-mode theory of spin dynamics. This theory is consistent with the spherical model for static spin correlations; as the temperature, T, approaches zero the inverse correlation length kappa approx equals exp(-const./T). For a ferromagnetic exchange coupling, the decay rate of long wavelength fluctuations, Gamma(q), is proportional to q(sup 2)T(sup 1/2) in the limit (q/kappa) yields infinity, whereas in the opposite, hydrodynamic limit Gamma(q) (alpha) q(sup 2) (T ln (kappa/q))(sup 1/2). At the wave vector for incipient antiferromagnetic ordering, the decay rate is proportional to kappa T(sup 1/2), while the corresponding decay rate near the Brillouin zone center is proportional to q(sup 2)T((sup 1/2)/kappa). The coupled-mode equations for ferromagnetically and antiferromagnetically coupled models are solved numerically on a fine grid of wave vectors. The spin autocorrelation function, and its power spectrum, are surveyed over a wide range of temperatures and wave vectors. NTIS

TEMPERATURE DEPENDENCE OF A MAGNETOPOLARON IN A HARMONIC QUANTUM DOT IN RESONANT MAGNETIC FIELDS
Kadi Zhu and Shiwei Gu (Jiaotong Univ., Shanghai, China.) Nov. 1993 18 p
(DE94-629036; IC-93/374) Avail: CASI HC A03/MF A01 (US Sales Only)

The temperature and the size dependence of a magnetopolaron in a harmonic quantum dot are investigated theoretically in the presence of an external magnetic field normal to the plane of the quantum dot. It is shown that in resonant magnetic field, the two cyclotron masses (m(sup *)(sub c+) and m(sup *)(sub c-)) in a harmonic quantum dot are each split into two cyclotron masses, respectively. The upper branches of m(sup *)(sub c+) and m(sup *)(sub c-) are the increasing functions of temperature, while the lower branches of m(sup *)(sub c+) and m(sup *)(sub c-) are the slowly decreasing functions of temperature. The results also show that the resonant magnetic fields are different in the quantum dots of different sizes. DOE

Sandia National Laboratories' mission is to solve important problems in the areas of national defense, energy security, environmental integrity, and industrial technology. The laboratories' strategy for accomplishing this mission is to conduct research to provide an understanding of the important physical phenomena underlying any problem, and then to construct validated computational models of the phenomena which can be used as tools to solve the problem. In the course of implementing this strategy, Sandia's technical staff has produced a wide variety of numerical problem-solving tools which they use regularly in the design, analysis, performance prediction, and optimization of Sandia components, systems, and manufacturing processes. This report provides the relevant technical and accessibility data on the numerical codes used at Sandia, including information on the technical competency or capability area that each code addresses, code 'ownership' and release status, and references describing the physical models and numerical implementation. MATERIALS FOR ADAPTIVE STRUCTURAL ACOUSTIC CONTROL, VOLUME 2 Annual Report, 1 Feb. 1993 - 31 Jan. 1994
L. E. Cross 11 Apr. 1994 208 p See also AD-A279223 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-92-J-1510)
(AD-A279222) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The research goals of this ONR sponsored University Research Initiative entitled 'Materials for Adaptive Structural Acoustics Control' relate directly to the sensing and actuating material which must be integrated to function in adaptive control of acoustic structures. This report documents work in the second year of the program and for convenience the activities are grouped under the headings General Summary Papers, Materials Studies, Composite Sensors, Actuator Studies, Integration Issues, Processing Studies, and Thin Film Ferroelectrics. The general papers cover a new comprehensive description of ferroelectric ceramics and their applications, analysis of high temperature piezoelectric sensors and the possible application of nonlinearity in enhancing the smartness of ceramics and composites. Scale effects on ferroics are of increasing interest and the manner in which nano-scale polar regions control the properties of relaxor ferroelectrics is again emphasized. For material studies the detailed examination of the evolution of diffuse, then relaxor behavior in lanthanum modified lead titanate has been completed. Interest in the soft PZT's, relaxor and phase switching materials continues, with a new thrust developing towards a more complete description of domain walls and morphotropic phase boundaries in perovskites. Materials issues in the wear out and fatigue effects in polarization switching systems have been subjected to detailed evaluation and the precautions necessary to fabricate long lasting materials which will stand 109 switches without any fatigue are delineated. THE COMBUSTIVE SOUND SOURCE M.S. Thesis
Preston S. Wilson 21 Apr. 1994 80 p
(ARL-TR-94-9) Avail: CASI HC A05/MF A01

This thesis describes a unique type of low frequency underwater sound source, the Combustive Sound Source (CSS). The fundamental operating principle of CSS is the following: Electrolysis of water produces hydrogen and oxygen gas, which is a combustible mixture. The gas mixture is captured in a combustion chamber and ignited with a spark. The ensuing combustion produces expanding gases which in turn produce high intensity, low frequency acoustic pulses. The thesis begins by discussing the background of the project and initial feasibility work. It continues by briefly discussing electrolysis and gas production. Fundamental combustion theory is discussed, along with two experiments that relate the acoustic output of CSS to theory. Additional experiments were conducted in order to compare the first bubble period in the CSS pressure signature with the predictions of the Rayleigh-Willis equation. The dependence of the radiated acoustic waveform on the volume and depth of the bubble was investigated. The first bubble period of the CSS pressure signature agrees with Rayleigh-Willis theory in trend, but not in absolute value. Empirical equations are presented which predict the first bubble period for three different situations, a depth of nine meters for various stoichiometric volumes, a stoichiometric volume of 0.5 STP liters for various depths, and a stoichiometric volume of 500 cubic centimeters for various depths. High speed filming of the CSS bubble is presented. The high speed films confirm that CSS produces a bubble of high temperature combustion products. The bubble oscillates and generates acoustic output. The motion of the bubble is shown to be related to the acoustic output in the classic manner, with pressure peaks associated with minimum bubble volumes. Finally, several other factors that affect the acoustic output of CSS are discussed. These include the shape of the CSS combustion chamber, the ignition source, the oxidizer, the presence of high pressure bubble collapses, and the presence of high frequency components. WAVELET-BASED ACOUSTIC RECOGNITION OF AIRCRAFT
W. B. Dress and S. W. Kercel 1994 15 p Presented at the Society of Photo-Optical Instrumentation Engineers Conference on Intelligent Information Systems, Orlando, FL, 4-8 Apr. 1994
(Contract DE-AC05-84OR-21400)
(DE94-017701; CONF-940449-15) Avail: CASI HC A03/MF A01

We describe a wavelet-based technique for identifying aircraft from acoustic emissions during take-off and landing. Tests show that the sensor can be a single, inexpensive hearing-aid microphone placed close to the ground the paper describes data collection, analysis by various technique, methods of event classification, and extraction of certain physical parameters from wavelet subspace projections. The primary goal of this paper is to show that wavelet analysis can be used as a divide-and-conquer first step in signal processing, providing both simplification and noise filtering. The idea is to project the original signal onto the orthogonal wavelet subspaces, both details and approximations. Subsequent analysis, such as system identification, nonlinear systems analysis, and feature extraction, is then carried out on the various signal subspaces. DOE

SIGNAL-TO-NOISE GAIN FROM ADAPTIVE MATCHED-FIELD BEAMFORMING OF MULTIDIMENSIONAL ACOUSTIC ARRAYS Final Report, Oct. 1989 - Oct. 1990
Newell O. Booth and Gary L. Mohnkern Sep. 1994 29 p
(AD-A285671; NCCOSC/RDT/E-TR-1661) Avail: CASI HC A03/MF A01

Linear and adaptive matched-field beamforming of multidimensional arrays provide signal-to-noise gain and an estimation of range, depth, and azimuth of the sources of incident signals. Adaptive matched-field beamforming (MFB) with large arrays is predicted to achieve gain equal to the directivity index plus the total input-interference to independent-noise ratio (IINR). An example distribution of received interference levels illustrates that measurements with relatively small volumetric arrays can determine the IINR, enabling an estimation of achievable array gain. Array sidelobe level requirements for adaptive MFB are derived, showing that good performance is obtained with relatively high sidelobes. Adaptive matched-field gain degradation from replica errors is shown to approach the linear matched-field gain degradation at low-output-signal-to-noise ratios. DTIC

ACOUSTIC EMISSION: THE FIRST HALF CENTURY
Thomas F. Drouillard 1994 13 p Presented at the 12th International Acoustic Emission Symposium, Sapporo, Japan, 21 Oct. 1994
(Contract DE-AC34-90DP-62349)
(DE94-017176; RFP-4875; CONF-9410182-1) Avail: CASI HC A03/MF A01

The technology of acoustic emission (AE) is approaching the half century mark, having had its beginning in 1950 with the work of Joseph Kaiser. During the 1950s and 1960s researchers delved into the fundamentals of acoustic emission, developed instrumentation specifically for AE, and characterized the AE behavior of many materials. AE was starting to be recognized for its unique capabilities as an NDT method for monitoring dynamic processes. In the decade of the 1970s research activities became more coordinated and directed with the formation of the working groups, and its use as an NDT method continued to increase for industrial applications. In the 1980s the computer became a basic component for both instrumentation and data analysis, and today it has sparked a resurgence of opportunities for research and development. Today we are seeing a transition to waveform-based AE analysis and a shift in AE activities with more emphasis on applications than on research. From the beginning, we have been fortunate to have had so many dedicated savants with different fields of expertise contribute in a collective way to bring AE to a mature, fully developed technology and leave a legacy of knowledge recorded in its literature. AE literature has been a key indicator of the amount of activity, the proportion of research to application, the emphasis on what was of current interest, and the direction AE has taken. The following is a brief survey of the history of acoustic emission with emphasis on development of the infrastructure over the past half century. DOE

METHOD AND SYSTEM OF MAPPING ACOUSTIC NEAR FIELD Patent
Joseph A. Clark, inventor (to Navy) and Michael A. Sartori, inventor (to Navy) 13 Sep. 1994 10 p Filed 11 Aug. 1993
(AD-D016574; US-Patent-5,347,496; US-Patent-Appl-SN-104707; US-Patent-Class-367-140) Avail: US Patent and Trademark Office

A method and system for mapping the acoustic near field of a stationary axial symmetric structure are provided. The structure is subjected to a rotating excitation energy profile from a plurality of stationary excitation sites located radially around the structure. The acoustic near field of the structure due to the rotating excitation energy profile is measured along at least one line that conforms to a longitudinal surface of the structure. Mapping of the acoustic near field is complete when one rotation of the rotating excitation energy profile is complete. DTIC

CASCADE ORIFICIAL RESISTIVE DEVICE Patent
Nicholas Bitsakis, inventor (to Navy) and James Cassidy, inventor (to Navy) 12 Jul. 1994 6 p Filed 16 Jun. 1992
(AD-D016529; US-Patent-5,327,941; US-Patent-Appl-SN-899520; US-Patent-Class-138-42) Avail: US Patent and Trademark Office

A cascade orificial resistive device for throttling fluid flow which minimizes acoustic noise and internal vibrations is described herein. The device has a hollow body defining a fluid passageway, a plurality of perforated plates mounted within the passageway, a fixed end ring adjacent one end of the perforated plates, and a threadable end ring adjacent an opposite end of the perforated plates to place the plates in compression. Each of the perforated plates is a single piece molded plate having an integral outer ring and an integrally formed center keying mechanism as well as a plurality of orifices. The keying mechanism formed on each plate is designed so that adjacent ones of the plates have their orifices misaligned. In this manner, a pressure drop across each plate is created and the fluid flow through the device is throttled. The device of the present invention has utility in a number of onboard marine vessel systems wherein reduced acoustic noise and internal vibrations are particularly desirable. DTIC

DETERMINATION OF MULTIPLE SOUND SOURCES Annual Report, 1 Sep. 1993 - 31 Aug. 1994
William A. Yost, Stanley Sheft, and Raymond Dye 31 Aug. 1994 11 p
(Contract F49620-92-J-0489)
(AD-A286563; AFOSR-94-0713TR) Avail: CASI HC A03/MF A01

The results studied showed that the SALT procedure produced weights that were much more consistent with subject reports than threshold measures. That is, the change in weights with increasing stimulus duration for the lateralization task indicated that the tones become more separable (analytic listening) as the overall duration increases. This does not occur with traditional measures of thresholds. In the amplitude modulation task, the modulated tones become more separable (analytic listening) as the modulation rates of the targets and distractor differ. Again traditional measures using thresholds do not show the same trend. Subjects also report that the modulated tones are different when the rates differ. DTIC

EXPERIMENTAL AND THEORETICAL EVALUATION OF ELASTIC WAVES IN CURVED LAYERED MEDIA Interim Report No. 3
Dale E. Chimenti and Ali Safaeinilli Jul. 1994 73 p
(Contract N61533-91-K-0032)
(AD-A286578) Avail: CASI HC A04/MF A01

This report describes the progress achieved during the third period of the study of elastic wave reflection from the curved and planar media subject to water loading. During the previous period, extensive experimental investigations were initiated to study parametrically the behavior of acoustic beams at curved and planar fluid-solid interfaces. Three types of materials, representative of Navy applications, in two geometries and two sizes, and many values of incident angle and angular or linear coordinates were included in the effort of last year. Simultaneously, an aggressive program of theoretical modeling and experimental verification were mounted and essentially all of the data were compared to predictions of the model. We found, in most cases, very good agreement between model calculations and experimental data. For the theoretical modeling of these effects, the complex source point (CSP) method was used to produce Gaussian line sources to account for the wave-solid interaction for acoustic beams. The scattering problem solved in this work is couched in terms of spectral integrals that are approximated by high-frequency uniform asymptotics. The resulting expressions for the reflected field contain interacting specularly reflected beam and leaky wave contributions which establish the physical basis for the observed phenomena. In addition to the two-dimensional modeling for comparison to experiments, work began to formulate a 3-D beam model within the theoretical framework for this more complicated circumstance as well. In continuation of the efforts of last year, we have extended the two-dimensional model to three dimensions. DTIC

The ability to classify helicopters based on their acoustic signature has applications to both detection and tracking. The current approach to this problem uses standard signal-processing techniques to extract features based on the fundamental harmonics of the helicopters' blades. This document examines the role that the wavelet transformation might play in this feature extraction process. It addresses ways to use the wavelet transform both to improve the performance of the existing approach and to expand the capabilities of the classification system. DTIC

MANDREL BASED EMBEDDED PLANAR FIBER-OPTIC INTERFEROMETRIC ACOUSTIC SENSOR Patent Application
Nichols Lagakas, inventor (to Navy) and Joseph A. Bucaro, inventor (to Navy) 28 Feb. 1994 38 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-D016229; US-Patent-Appl-SN-202628) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This invention is an optimized planar fiber optic sensor utilizing robust design having high acoustic sensitivity and reduced acceleration response over that found in the prior art. A continuous optical fiber sensing arm is wrapped around a plurality of mandrels to reduce acceleration effects. An optical fiber sensing arm is embedded in an epoxy material to effectively eliminate the effects of the acoustic medium on the reference arm. The sensing arm and reference arm, along with input and output couplers, are encapsulated within an elastomer, natural rubber or butyl rubber which is an active element that providing high acoustic sensitivity. The mandrels may be solid compliant mandrels, tubular cylindrical mandrels, and combinations thereof. DTIC

TEMPERATURE EFFECTS ON ACOUSTIC INTERACTIONS BETWEEN ALTITUDE TEST FACILITIES AND JET ENGINE PLUMES Final Report, Feb. 1992 - May 1994
K. K. Ahuja, K. C. Massey, C. K. Tan, and R. R. Jones Oct. 1994 300 p
(Contract NAS1-19061)
(NASA-CR-197638; NAS 1.26:197638; AD-A286058; AEDC-TR-94-10)
Avail: CASI HC A13/MF A03

The overall objective of the present investigation was to determine the mechanisms responsible for engine/test cell resonance observed at the AEDC facility. The specific objective was to determine the effect of heating the jet on its coupling with the diffuser used in a typical engine/test cell facility. This objective was to be accomplished through systematic measurements of cold and heated free and ducted jets using a subscale facility. An additional objective was to analytically examine the behavior of jet instability waves as a function of temperature, and to identify any potential of strong coupling between the jet instabilities and diffuser duct resonance modes directly attributable to heating of the jet. Model cold and heated jet experiments are performed with an axisymmetric convergent nozzle in a test setup that simulates a supersonic jet exhausting into a cylindrical diffuser. The measured data consist of a free and ducted plume for a range of jet exit Mach numbers and four reservoir temperatures: ambient, 400 F, 750 F, and 1,000 F. Analytical results on the growth of instability waves and the duct resonance have been introduced. It is shown that the screech frequency increases with increasing operating temperature ratio. The measured in-duct microphone signatures contain a number of discrete tones, and almost all of them can be associated with duct resonances. The amplitudes increase with increasing Mach number and operating temperature ratios. At certain operating conditions, the acoustic fluctuations associated with these ejector duct modes excite the most amplified wave of the jet. DTIC

SCATTERING OF AN FM SIGNAL FROM AN ARRAY OF SPHERES Final Report
Theresa A. Baus and Ronald P. Radinski 15 Aug. 1994 16 p
(AD-A285587; NUWC-NPT-TD-10729) Avail: CASI HC A03/MF A01

This document describes the investigation of the dependence of peak target strength on source bandwidth and scatterer spacing using arrays of rigid scatterers and LFM signals at 200-, 400-, and 800-Hz bandwidths. The results demonstrate that, as the bandwidth increases, the average peak target strength increases and shows less aspect dependence (except near 90 degrees) due to more opportunity for coherent addition of the scattering amplitudes. As the spacing between the scatterers was increased, there were more fluctuations in aspect angle due to the greater directivity of the scattering pattern. Misaligning scatterers in a regularly spaced array smoothed the overall response and increased the average peak target strength. DTIC

MATERIALS FOR ADAPTIVE STRUCTURAL ACOUSTIC CONTROLS Annual Report, 1 Feb. 1993 - 31 Jan. 1994
L. E. Cross 31 Jan. 1994 156 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-92-J-1510)
(AD-A279255) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The research goals of this ONR sponsored University Research Initiative entitled 'Materials for Adaptive Structural Acoustics Control' relate directly to the sensing and actuating material which must be integrated to function in adaptive control of acoustic structures. This report documents work in the second year of the program and for convenience the activities are grouped under the headings General Summary Papers, Materials Studies, Composite Sensors, Actuator Studies, Integration Issues, Processing Studies, and Thin Film Ferroelectrics. The general papers cover a new comprehensive description of ferroelectric ceramics and their applications, analysis of high temperature piezoelectric sensors and the possible application of nonlinearity in enhancing the 'smartness' of ceramics and composites. Scale effects on ferroics are of increasing interest and the manner in which nanoscale polar regions control the properties of relaxor ferroelectrics is again emphasized. DTIC

ACTIVE CONTROL OF FAN NOISE-FEASIBILITY STUDY. VOLUME 1: FLYOVER SYSTEM NOISE STUDIES Final Report
Robert E. Kraft, B. A. Janardan, G. C. Kontos, and P. R. Gliebe Oct. 1994 42 p
(Contract NAS3-26617; RTOP 538-03-11)
(NASA-CR-195392-Vol-1; E-9170-Vol-1; NAS 1.26:195392-Vol-1) Avail: CASI HC A03/MF A01

A study has been completed to examine the potential reduction of aircraft flyover noise by the method of active noise control (ANC). It is assumed that the ANC system will be designed such that it cancels discrete tones radiating from the engine fan inlet or fan exhaust duct. Thus, without considering the engineering details of the ANC system design, tone levels are arbitrarily removed from the engine component noise spectrum and the flyover noise EPNL levels are compared with and without the presence of tones. The study was conducted for a range of engine cycles, corresponding to fan pressure ratios from 1.3 to 1.75. The major conclusions that can be drawn are that, for a fan pressure ratio of 1.75, ANC of tones gives about the same suppression as acoustic treatment without ANC, and for a fan pressure ratio of 1.45, ANC appears to offer less effectiveness than passive treatment. Additionally, ANC appears to be more effective at sideline and cutback conditions than at approach. Overall EPNL suppressions due to tone removal range from about 1 to 3 dB at takeoff engine speeds and from 1 to 5 db at approach speeds. Studies of economic impact of the installation of an ANC system for the four engine cases indicate increases of DOC ranging from 1 to 2 percent, favoring the lower fan pressure ratio engines. Further study is needed to confirm the results by examining additional engine data, particularly at low fan pressure ratios, and studying the details of the current results to obtain a more complete understanding. Further studies should also include determining the effects of combining passive and active treatment. Author

LOW FREQUENCY SOUND RADIATION FROM FINITE STIFFENED PLATES
Richard F. Keltie 28 Jul. 1993 23 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-93-1-0368)
(AD-A279395) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The purpose of the research effort reported herein was to assess the feasibility of developing efficient low frequency acoustic radiators using flexural vibration of submerged stiffened plates. Candidate radiator geometries were identified at NUWC using an infinite plate model. A finite plate implementation of these models was then examined by the author using an analysis capability previously developed. The purpose of this examination was to study the extent to which infinite plate results could be achieved by a finite radiator, and to obtain an estimate of the effects of plate size and number of attached ribs on the radiation characteristics. MEASUREMENT OF SOUND INTENSITY AND SOUND POWER
Vinh Trinh Feb. 1994 50 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A279246; MRL-TR-93-32; DODA-AR-008-561) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

In this report the concept of a measurement technique for calculating sound intensity in the frequency domain is discussed and also how such a measurement system can be implemented in practice by using a frequency domain analyzer. The technique described employs a dual-channel FFT analyzer to obtain a cross power spectrum from the two microphones from which sound intensity is calculated. This approach enables a general-purpose FFT analyzer together with a micro-computer to perform the function of a dedicated sound intensity analyzer. The application of sound intensity measurement technique in sound power determination of a reference source is presented. DTIC

EVALUATION OF SIMPLE SPHERICAL SPREADING MODEL FOR NEAR VERTICAL ACOUSTICAL PROPAGATION Final Report
John M. Noble Aug. 1994 99 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A286284; ARL-TR-532) Avail: CASI HC A05

A comparison study was performed to evaluate the performance of a simple spherical spreading plus molecular absorption model to a more complex acoustic propagation model for near vertical propagation. The problem of near vertical propagation is important since several acoustic detection systems are being developed for the Army. The operational use of a simple acoustic propagation model in the battlefield will allow for fast computation time providing rapid evaluation of the advantage or disadvantage of using the acoustic detection system. However, simple propagation models can have several limitations. To evaluate the limitations and determine the operational reliability of the simple acoustic propagation model, more complex models must be used that incorporate many effects of the ground and atmosphere on the propagation of sound. This comparison will determine the limitations. DTIC

FIBER OPTIC PRESSURE SENSING ARRAY Patent Application
Frank Cuomo, inventor (to Navy), Richard Schmidt, inventor (to Navy), and James Kelly, inventor (to Navy) 22 Feb. 1994 13 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-D016245; US-Patent-Appl-SN-200032) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

An optical pressure sensing array is provided for sensing a high-frequency acoustic energy profile. The array is coupled to a reflector that is responsive to high-frequency acoustic pressure variations. The array transmits and receives light energy to and from the reflector. The received light energy is modulated by the movement of the reflector because of the acoustic field. Each element in the optical array is a closely packed geometrical configuration utilizing a single transmit optical fiber surrounded by six receive fibers, all having the same radius. In this configuration, the receive fibers receive light energy only from their associated transmit fiber resulting in a high-resolution acoustic profile. Furthermore, the geometric configuration permits a center-to-center element spacing that optimally is one-half the wavelength of the ultrasonic beam providing the acoustic energy at the operational frequency. NEW STRONG INTERACTIONS ABOVE THE ELECTROWEAK SCALE
A. R. White Aug. 1994 32 p Presented at the 8th International Symposium on Very High Energy Cosmic Ray Interactions, Tokyo, Japan, 24-31 Jul. 1994
(Contract W-31-109-eng-38)
(DE94-018385; ANL-HEP-CP-94-46; CONF-9407127-1) Avail: CASI HC A03/MF A01

Theoretical arguments for a new higher-color quark sector, based on Pomeron physics in QCD, are briefly described. The electroweak symmetry-breaking, strong CP conservation, and electroweak scale CP violation, that is naturally produced by this sector is also outlined. A further consequence is that above the electroweak scale there will be a radical change in the strong interaction. Electroweak states, in particular multiple W's and Z's, and new, semi-stable, very massive, baryons, will be commonly produced. The possible correlation of expected phenomena with a wide range of observed cosmic ray effects at and above the primary spectrum knee is described. Related phenomena that might be seen in the highest energy hard scattering events at the Fermilab Tevatron, some of which could be confused with top production, are also briefly discussed. DOE

CHARGED PARTICLE DYNAMICS IN THE ACCELERATION GAP OF THE PBFA 2 ION DIODE
J. E. Bailey, A. L. Carlson, and A. B. Filuk et al 1994 4 p Presented at the 10th International Conference on High Power Particle Beams, San Diego, CA, 20-24 Jun. 1994
(Contract DE-AC04-94AL-85000)
(DE94-017347; SAND-93-3837C; CONF-940634-15) Avail: CASI HC A01/MF A01

We are improving the understanding of pulsed-power-driven ion diodes using measurements of the charged particle distributions in the diode anode-cathode (AK) gap. We measure the time- and space-resolved electric field in the AK gap using Stark-shifted Li I 2s-2p emission. The ion density in the gap is determined from the electric field profile and the ion current density. The electron density is inferred by subtracting the net charge density, obtained from the derivative of the electric field profile, from the ion density. The measured electric field and charged particle distributions are compared with results from QUICKSILVER, a 3D particle-in-cell computer code. The comparison validates the fundamental concept of electron build-up in the AK gap. However, the PBFA 2 diode exhibits considerably richer physics than presently contained in the simulation, suggesting improvements both to the experiments and to our understanding of ion diode physics. CAVITY-QED ENHANCEMENT OF FLUORESCENCE YIELDS IN MICRODROPLETS
M. D. Barnes, W. B. Whitten, and J. M. Ramsey 1993 18 p Presented at the 1993 Edgewood Research, Development and Engineering Center Science Conference on Obscuration and Aerosol Research, Aberdeen, MD, 21-25 Jun. 1993
(Contract DE-AC05-84OR-21400)
(DE94-018662; CONF-9306210-2) Avail: CASI HC A03/MF A01

Measurements of the integrated fluorescence yield of Rhodamine 6G (R6G) in levitated microdroplets (4 to 16 (mu)m diameter) display a size dependence which is attributed to a decreased probability per excitation cycle of photochemical bleaching as a result of cavity-enhanced spontaneous emission rates. The average number of fluorescence photons detected per molecule in 4 (mu)m droplets (where emission rate enhancement has been previously demonstrated) is shown to be approximately a factor of 2 larger than the yield measured for larger droplets where emission rate enhancement does not occur. Within some simple approximations, these results suggest that essentially no emission rate inhibition occurs in this system. A mechanism based on spectral diffusion is postulated for the apparent absence of cavity-inhibited emission and is illustrated by Monte Carlo calculations using time-dependent lineshape functions. INTRINSIC BARRIERS FOR H-ATOM TRANSFER REACTIONS
D. M. Camaioni, S. T. Autrey, and J. A. Franz Aug. 1994 9 p Presented at the 208th American Chemical Society National Meeting, Washington, DC, 21-26 Aug. 1994
(Contract DE-AC04-94AL-85000)
(DE94-018914; PNL-SA-24421; CONF-940813-22) Avail: CASI HC A02/MF A01

Hydrogen transfer reactions play a well-recognized role in coal liquefaction. While H-abstraction reactions between radicals and H-donors have been well-studied, understanding of structure-reactivity relationships remains surprisingly incomplete. Another form of hydrogen transfer known as radical hydrogen transfer (radical donation of H to an unsaturated compound) is currently the subject of much speculation. The barriers for identity reactions are key parameters in the Evans-Polanyi equation for estimating reaction barriers and are fundamentally significant for the insight they provide about bond reorganization energies for formation of transition state structures. Although knowable from experiment, relatively few H-abstraction identity barriers and no barriers for hydrocarbon radical hydrogen transfer reactions have been measured. This paper seeks to supplement and extend existing experimental data with results obtained by calculation. The authors have used ab initio and semiempirical molecular orbital methods (MNDO-PM3) to calculate barriers for a series of H-atom abstraction and radical-hydrogen-transfer identity reactions for alkyl, alkenyl, arylalkyl and hydroaryl systems. Details of this methodology and analyses of how barrier heights correlate with reactant and transition state properties will be presented and discussed. DOE

USING SCIENCE CENTERS TO EXPOSE THE GENERAL PUBLIC TO THE MICROWORLD

E. Malamud Aug. 1994 18 p Presented at the Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM, 2-6 Aug. 1994

(Contract DE-AC02-76CH-03000)

(DE95-000647; FNAL/C-94/264; CONF-940816-26) Avail: CASI HC A03/MF A01

Despite the remarkable progress in the past decades in understanding our Universe, we particle physicists have failed to communicate the wonder, excitement, and beauty of these discoveries to the general public. I am sure all agree there is a need, if our support from public funds is to continue at anywhere approximating the present level, for us collectively to educate and inform the general public of what we are doing and why. Informal science education and especially science and technology centers can play an important role in efforts to raise public awareness of particle physics in particular and of basic research in general. Science Centers are a natural avenue for particle physicists to use to communicate with and gain support from the general public. DOE

SEARCH FOR W PAIR PRODUCTION WITH DILEPTON DECAY MODES AT D0

Nobuaki Oshima Sep. 1994 6 p Presented at the Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM, 2-6 Aug. 1994

(Contract DE-AC02-76CH-03000)

(DE95-000724; FNAL/C-94/285-E; CONF-940816-29) Avail: CASI HC A02/MF A01

We present the results of a search of 13.5 pb(sup -1) of p(-p) collisions at (radical)s = 1.8 TeV for WW yields dileptons + X using the DO detector. One WW yields e(mu)v(-v) + X candidate was found with an expected background of about 0.96 plus/minus 0.44 events. One WW yields e(mu)v(-v)+ candidate was found with an expected background of about 1.23 plus/minus 0.87 events. The 95% C.L. upper limit for the W pair production cross section is 133 pb without background subtraction. Making the constraint kappa = 1 (Delta(kappa) = 0) implies -2.6 less than or = gamma less than or = 2.7 (95% C.L.) and making the constraint gamma = 0 implies -3.3 less than or = Delta(kappa) less than or = 3.5 (95% C.L.) assuming kappa(sub gamma) = kappa(sub Zeta) and lambda(sub gamma) = lambda(sub Zeta). We also present the contour of excluded couplings when kappa and lambda are allowed to simultaneously vary from their standard model values. DOE

DATA ANALYSIS AND VISUALIZATION IN MCNP (TRADEMARK)

L. S. Waters 1994 4 p Presented at the Winter Meeting of the American Nuclear Society, Washington, DC, 13-18 Nov. 1994

(Contract W-7405-eng-36)

(DE94-016164; LA-UR-94-2521; CONF-941102-11) Avail: CASI HC A01/MF A01

There are many situations where the user may wish to go beyond current MCNP capabilities. For example, data produced by the code may need formatting for input into an external graphics package. Limitations on disk space may hinder writing out large PTRAK files. Specialized data analysis routines may be needed to model complex experimental results. One may wish to produce particle histories in a format not currently available in the code. To address these and other similar concerns a new capability in MCNP is being tested. A number of real, integer, logical and character variables describing the current and past characteristics of a particle are made available online to the user in three subroutines. The type of data passed can be controlled by cards in the INP file. The subroutines otherwise are empty, and the user may code in any desired analysis. A new MCNP executable is produced by compiling these subroutines and linking to a library which contains the object files for the rest of the code. DOE

MCNP (TRADEMARK) ENDF/B-VI IRON BENCHMARK CALCULATIONS

J. D. Court and J. S. Hendricks 1994 5 p Presented at the Winter Meeting of the American Nuclear Society, Washington, DC, 13-18 Nov. 1994

(Contract W-7405-eng-36)

(DE94-016165; LA-UR-94-2520; CONF-941102-14) Avail: CASI HC A01/MF A01

Four iron shielding benchmarks have been calculated for, we believe the first time, with MCNP4A and its new ENDF/B-VI library. These calculations are part of the Hiroshima/Nagasaki dose re-evaluation for the National Academy of Sciences and the Defense Nuclear Agency. We believe these calculations are significant because they validate MCNP and the new ENDF/B-VI libraries. These calculations are compared to ENDF/B-V, experiment, and in some cases the recommended MCNP data library (a T-2 evaluation) and ENDF/IV. DOE

CONVERGENT CLOSE-COUPLING METHOD FOR CALCULATION OF ELECTRON SCATTERING ON HYDROGEN-LIKE TARGETS

Igor Bray Sep. 1993 46 p Submitted for publication

(DE94-631340; ESM-60) Avail: CASI HC A03/MF A01 (US Sales Only)

The Convergent Close-Coupling (CCC) method for the calculation of electron-hydrogen scattering was extended to hydrogen-like targets, atoms or ions. These include H, Li, Na, and K atoms, as well as the multitude of ions which have the same isoelectronic sequence as these atoms. The reliability of the method is independent of the projectile energy, and its applicability was demonstrated. It shows excellent agreement with a large set of measurements for electron scattering on sodium at projectile energies ranging from 1 to 54.4 eV. These measurements include spin asymmetries, singlet and triplet angular momentum (L) transferred to the atom perpendicular to the scattering plane, reduced Stokes parameters, differential, integrated, and total cross sections, as well as the total ionization spin asymmetry. The method is found to give better agreement with experiment than any other over this entire energy range. DOE

N95-20197# Flinders Univ., Adelaide (Australia). Electronic Structure of Materials Centre.

CALCULATION OF THE TOTAL AND TOTAL IONIZATION CROSS SECTIONS FOR POSITRON SCATTERING ON ATOMIC HYDROGEN

Igor Bray and A. T. Stelbovics Oct. 1993 9 p

(DE94-631341; ESM-62) Avail: CASI HC A02/MF A01 (US Sales Only)

The total and total ionization cross sections for positron scattering on atomic hydrogen are calculated by applying the Convergent Close-Coupling (CCC) method to the model where positronium formation channels are omitted. This model accurately describes the physics of the scattering whenever the positronium formation cross section is negligible, in particular, above 100 eV for this system. The total ionization cross section resulting in this energy region are in excellent agreement with the recent measurements of Jones et al., and so lie below the earlier measurements of Spicher et al., and the recent calculations of Acacia et al.. The total cross section is in very good agreement with the recent measurements of Zhou et al. down to 30 eV. DOE

THE (e,2e) CALCULATIONS WITH THE FINAL-STATE BOUNDARY CONDITION
D. A. Konovalov and I. E. McCarthy Nov. 1993 6 p
(DE94-631342; ESM-63) Avail: CASI HC A02/MF A01 (US Sales Only)

Calculations explore the use of an auxiliary final-state wave function with the Redmond boundary condition in attempting to describe the absolute cross sections for ionization of helium in coplanar-symmetric kinematics. DOE

N95-20199# Flinders Univ., Adelaide (Australia). Electronic Structure of Materials Centre.
CALCULATION OF ELECTRON SCATTERING ON THE He(+) ION
Igor Bray, I. E. McCarthy, J. Wigley, and A. T. Stelbovics Nov. 1993 10 p
(DE94-631343; ESM-64) Avail: CASI HC A02/MF A01 (US Sales Only)

The Convergent Close-Coupling method is applied to the calculation of electron scattering on the ground state of He(+). The inclusion of the treatment of the continuum, even below the ionization threshold, significantly reduces the calculated 2S cross section. Generally, it shows good agreement with the measurements of the 2S excitation cross section, though in the vicinity of a few eV near threshold the results are characteristically higher than the experiment. Complete quantitative agreement is obtained with the measurement of the total ionization cross section from threshold to 700 eV. DOE

DESIGN TRADE-OFF STUDY FOR A LARGE VOLUME SHORT PULSE NEUTRON ASSEMBLY
P. J. Griffin, J. D. Miller, G. A. Harms, E. J. Parma, R. L. Coats, W. C. Fan, and J. P. Petraglia (Battelle Pantex, Amarillo, TX.) 1994 9 p Presented at the Winter Meeting of the American Nuclear Society, Washington, DC, 13-18 Nov. 1994
(Contract DE-AC04-94AL-85000)
(DE94-019175; SAND-94-0796C; CONF-941102-24) Avail: CASI HC A02/MF A01

There is a continuing need within the radiation effects research community for more intense and larger volume pulsed neutron facilities. To fulfill these requirements a study was performed to examine conceptual designs for a neutron assembly that could produce high-intensity, short pulse neutron environments over a large experimental volume. The desired system characteristics were a cylindrical experimental cavity 60 inches long (152.4 cm) with a 24 inch diameter (60.96 cm), a cavity fluence of phi(sub r) = 8 x 10(exp 14) n/cm(exp 2), and a neutron pulse width of tau = 10-20 (mu)s. Attention was focused on booster assemblies which have been studied since the 1950s at Harwell, General Atomic, and at Sandia National Laboratories. Five conceptual designs were developed and evaluated. Only a two-stage coupled core design with a NpO2 primary core assembly was found to meet the design goals. A program is proposed to refine the design and to construct this nuclear assembly. The proposed three-phase effort represents a conservative approach that will yield large increases in the experiment volume even if the final coupled-core design is not realized. DOE

SEARCH FOR TOP IN DO USING THE ELECTRON + JETS CHANNEL WITH SOFT MUON TAGGING
R. Raja Sep. 1994 5 p Presented at the 27th International Conference on High Energy Physics, Glasgow, Scotland, 21-27 Jul. 1994
(Contract DE-AC02-76CH-03000)
(DE95-001284; FNAL/C-94/327-E; CONF-940722-26) Avail: CASI HC A01/MF A01

We present preliminary results for the search for the top quark in DO in the electron + jets channel where one of the b quark jets is tagged by means of a soft muon, using 13.5 pb(exp -1) of data. Standard model decay modes for the top quark are assumed. We present the resulting top cross section and error as a function of top mass using this channel combined with the dilepton channel and the untagged lepton + jets channel presented elsewhere in this session. At present, no significant signal for top quark production can be established. DOE

A S2-LIKE ACCELERATION METHOD FOR THE NONLINEAR CHARACTERISTIC TRANSPORT SCHEME
T. A. Wareing, W. F. Walters, and J. E. Morel 1994 6 p Presented at the Winter Meeting of the American Nuclear Society, Washington, DC, 13-18 Nov. 1994
(Contract W-7405-eng-36)
(DE94-016285; LA-UR-94-2397; CONF-941102-13) Avail: CASI HC A02/MF A01

Recently a nonlinear spatial differencing scheme for solving the discrete-ordinate equations was introduced. This scheme, referred to as the Nonlinear Characteristic (NC) scheme, is accurate for both optically thin and optically thick spatial meshes and is strictly positive. The NC discrete-ordinate equations can be solved using the source iteration (SI) method. It is well known that the SI method converges infinitely slowly for optically thick problems with scattering ratios near unity. In this summary, we describe a S2-like acceleration scheme for accelerating the convergence of the SI method as applied to the NC scheme and provide results to show how effective it is. DOE

NEW DATA FOR MCNP (TRADEMARK)
J. S. Hendricks, S. C. Frankle, and J. D. Court 1994 5 p Presented at the Winter Meeting of the American Nuclear Society, Washington, DC, 13-18 Nov. 1994
(Contract W-7405-eng-36)
(DE94-016296; LA-UR-94-2376; CONF-941102-17) Avail: CASI HC A01/MF A01

We report here for the first time the availability of an official set of ENDF/B-VI neutron data for MCNP(trademark). The LANL Radiation Transport group engaged the Nuclear Theory and Applications Group to construct a complete library based on ENDF/B-VI Release in the Spring of 1994. A new and thorough set of quality assurance tests was established and data passing those tests were subject only to a limited set of benchmarking tests. All nuclides were subjected to infinite medium calculations. The fissionable materials were benchmarked against critical assemblies, and 28 nuclides were benchmarked against the LLNL pulsed sphere experiments. DOE

DYNAMICS OF COLLISION PROCESSES
A. F. Starace Feb. 1994 7 p
(Contract DE-FG02-88ER-13955)
(DE94-017593; DOE/ER-13955/16) Avail: CASI HC A02/MF A01

Investigations have been carried out of one-, two-, and three-photon detachment of the negative hydrogen ion (H(-)) including effects of electron correlations, of two-color detachment of H(-) with excitation of H(n=2), and of the (sup 3pe) state of H(-). Striking effects of long-range dipole field interactions have been demonstrated. Electron correlation effects on detachment cross sections have been quantified. Electric field effects on photodetachment of H(-) above the H(n=2) threshold have also been elucidated. Variational R-matrix calculations of photodetachment of Hand of Li(-) including excitations of the residual atoms up to the n=6 level have provided state-of-the-art agreement with recent experimental results. Furthermore, doubly-excited-state spectra of H(-) and Li(-) have been shown to be remarkably similar. DOE

MCNP (TRADEMARK) DIRECTIONS
J. S. Hendricks 1994 6 p Presented at the Winter Meeting of the American Nuclear Society, Washington, DC, 13-18 Nov. 1994
(Contract W-7405-eng-36)

(DE94-016216; LA-UR-94-2547; CONF-941102-12) Avail: CASI HC A02/MF A01

The MCNP code development program is a relatively large and rapidly changing project in the small and highly-specialized field of radiation transport, specifically radiation protection and shielding. A number of major new MCNP initiatives are described in the subsequent papers in this session. The focus of this paper is the important new developments not described elsewhere and a number of recent developments that have been available since MCNP4A but have gone unnoticed. In particular, we report for the first time a new MCNP quality assurance initiative providing 97% test coverage, a new MCNP feature enabling plotting of nuclear data, and the other new features developed so far for MCNP4B. Finally, an attempt is made to articulate how all these fit together into the overall MCNP development program. DOE

DENSITY FUNCTIONAL STUDIES OF DECOMPOSITION PROCESSES OF ENERGETIC MOLECULES
Peter Politzer, Jorge M. Seminario, and M. E. Grice 3 Nov. 1994 13 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-4057)
(AD-A286185) Avail: CASI HC A03

Nonlocal density functional theory is an effective means for determining the energetics and elucidating the mechanisms of the decomposition processes of molecules of real chemical interest and significance. It should be viewed as another practical tool that is available for this purpose, a useful addition to existing experimental techniques, but with the extremely important advantage that it can be applied to proposed molecules that may not yet have been synthesized or isolated. Decomposition energetics of some nitramines and nitrotriazoles are presented and discussed. DTIC

AMORPHIZATION OF SAPPHIRE DURING ION BEAM MIXING
D. L. Joslin (Tennessee Univ., Knoxville, TN.), C. J. McHargue (Tennessee Univ., Knoxville, TN.), C. W. White, and N. D. Evans (Oak Ridge Inst. for Science and Education, TN.) 1994 9 p Presented at the Nuclear Instruments and Methods in Physics Research on Radiation Effects in Insulators, Nagoya, Japan, 5-10 Sep. 1993
(Contracts DE-AC05-84OR-21400; DE-AC05-76OR-00033)
(DE94-018713; CONF-9309259-6) Avail: CASI HC A02/MF A01

Earlier studies indicated that implantation of zirconium into sapphire at room temperature produced an amorphous layer at a critical composition of approximately 6.5% (cation). Further insight into the amorphization of sapphire has been provided by ion beam mixing studies. Bi-layer couples of approx. 80 nm thick polycrystalline ZrO2 films deposited on the (0001) face of alpha-Al2O3 single crystals were irradiated to 4 x 10(exp 16) ions/sqcm with Kr (475 keV, 20 C), or Cr (340 keV, 20 C or approx. 900 C). Transmission electron microscopy showed the unirradiated couples to have sharp, planar interfaces between the films and substrates. Recoil mixing by both ion species gave Zr concentrations greater than 10% (cation) to depths of 10-20 nm. An amorphous layer containing Zr was present at the interface for samples irradiated at room temperature. The sample mixed at the elevated temperature contained a sharp interface similar to the as-deposited sample. The present results suggest that both irradiation-produced damage (defects) and certain chemical species are required to amorphize sapphire. DOE

A TAU-CHARM-FACTORY AT ARGONNE
J. Norem and J. Repond 18 Jul. 1994 8 p Presented at the Workshop on the Future of High Sensitivity Charm Experiments, Batavia, IL, 7-9 Jun. 1994
(Contract W-31-109-eng-38)
(DE94-016913; ANL-HEP-CP-94-39; CONF-9406242-1) Avail: CASI HC A02/MF A01

In this paper we explore the possibility of building a tau-charm-factory at the Argonne National Laboratory. A tau-charm-factory is an e(exp +)e(exp -) collider with a center-of-mass energy between 3.0 GeV and 5.0 GeV and a luminosity of at least 1 x 10(exp 33) cm(exp -2) s(exp -1). Once operational, the facility will produce large samples of tau pairs, charm mesons, and charmonium with either negligible or well understood backgrounds. This will lead to high precision measurements in the second generation quark and the third generation lepton sectors that cannot be done at other facilities. Basic physical properties and processes, such as the tau neutrino mass, rare tau decays, charm decay constants, rare charm meson decays, neutral D(sup 0) -- meson mixing, and many more will be studied with unique precision. An initial design of the collider including the injector system is described. The design shows that a luminosity of at least 1 x 10(exp 33) cm(exp -2) s(exp -1) can be achieved over the entire center-of-mass energy range of the factory. DOE

SEMI-LEPTONIC FORM-FACTORS FROM LATTICE QCD
T. Bhattacharya and R. Gupta 1994 4 p Presented at the Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM, 2-6 Aug. 1994
(Contract W-7405-eng-36)
(DE95-000871; LA-UR-94-3079; CONF-940816-33) Avail: CASI HC A01/MF A01

We present results for semileptonic form-factors obtained on statistical sample of 63 32(exp 3) x 64 lattices at beta = 6.0 using quenched

Wilson fermions. We find f(sub +)(sup D yields Klv) (q(exp 2) = 0) = 0.73 +/- 0.06, A(sub 2)/A(sub 1)(D yields K(sup *)lv) = 0.79 +/- 0.23, V/A(sub 1)(D(sub s) yields phi lv) = 1.89 +/- 0.04, and A(sub 2)/A(sub 1)(D(sub s) yields phi lv) = 0.70 +/- 0.09, where the error estimate includes statistical errors and errors due to extrapolation to q(exp 2) = 0 and to physical values of (m(sub u) + m(sub d))/2 and m(sub s). The remaining sources of systematic errors are those due to O(a) discretization errors and those due to quenching, which our results indicate may be small. We also comment on the validity of pole-dominance in these form-factors. DOE

N95-20401# Fermi National Accelerator Lab., Batavia, IL.
MASS AND LIFETIME MEASUREMENTS WITH EXCLUSIVE B RECONSTRUCTION AT CDF
J. D. Lewis Jul. 1994 16 p Presented at the Les Rencontres de Physique de la Vallee D'aoste, La Thuile, Italy, 6-12 Mar. 1994
(Contract DE-AC02-76CH-03000)
(DE94-015849; FNAL/C-94/128-E; CONF-9403127-2) Avail: CASI HC A03/MF A01

Lifetimes and masses of B mesons have been measured in exclusively reconstructed decays including J/(psi) yields (mu)(sup +) decays. In 19.3 pb(sup -1) of (bar p)p collisions at s(exp 1/2) = 1.8 TeV taken in 1992-93 at the Fermilab Tevatron collider, approximately 300 B mesons have been fully reconstructed. The measurements require precise determination of the helical track parameters of charged particle tracks. We find M(B(sub S)(sup O)) = 5367.7 +/- 2.4 +/- 4.8 MeV/c(exp 2), tau(B(sup +)) = 1.61 +/- 0.16 +/- 0.05 ps, and tau(B(sup O)) = 1.57 +/- 0.18 +/- 0.08 ps. DOE

MEASUREMENTS OF THE MASS AND WIDTH OF THE W BOSON FROM CDF
Young-Kee Kim (California Univ., Berkeley. Lawrence Berkeley Lab, CA.) 1994 11 p Presented at the 29th Moriond Meeting on Quantum Chromodynamics and High Energy Hadronic Interactions, Les Arcs, France, 12-26 Mar. 1994
(Contract DE-AC02-76CH-03000)
(DE94-015380; FNAL/C-94/169-E; CONF-940327-8) Avail: CASI HC A03/MF A01

We have made a preliminary determination of the W boson mass, M(sub W) = 80.38 +/- 0.23 GeV/c(exp 2) from a combined analysis of W yields e(nu) in (bar p) collisions at s(exp 1/2) = 1.8 TeV. The electron data alone approaches M(sub W) = 80.47 + /- 0.15(stat.) +/- 0.25(syst.) GeV/c(exp 2), while the muon data gives M(sub W) = 80.29 +/- 0.20(stat.) +/- 0.24(syst.) GeV/c(exp 2). Measuring the ratio (sigma)(sub W)(center dot)B(W approaches e(nu)) / (sigma)(sub Z) approaches e(sup +)e(sup -), we have extracted a value for the W width, Gamma(W) = 2.063 +/- 0.061(stat.) +/- 0.060(syst.) GeV and the branching ratio, (Gamma)(W approaches e(nu))/Gamma(W) = 0.1094 +/- 0.0033(stat.) +/- 0.0031(syst.). This allows us to set a decay mode independent limit on the top quark mass, m(sub top) greater than 62 GeV/c(exp 2) at the 95% C.L. DOE

N95-20418# Fermi National Accelerator Lab., Batavia, IL.
NUCLEAR A DEPENDENCE OF EXCLUSIVE VECTOR MESON PRODUCTION IN MUON SCATTERING
Heidi Schellman Jul. 1994 8 p Presented at the 29th Moriond Meeting on Quantum Chromodynamics and High Energy Hadronic Interactions, Les Arc, France, 12-26 Mar. 1994
(Contract DE-AC02-76CH-03000)
(DE95-002248; FNAL/C-94/219-E; CONF-940327-13) Avail: CASI HC A02/MF A01

Results on exclusive vector meson production from Fermilab muon scattering experiment E665 are presented. The A dependence of exclusive vector meson production is studied as a function of Q(exp 2). The data show a significant change in the dependence on A at higher values of Q(exp 2). The observed behavior is consistent with the idea of color transparency. DOE

NON DESTRUCTIVE CHARACTERIZATION USING PULSED FAST-THERMAL NEUTRONS
P. C. Womble, F. J. Schultz, and G. Vourvopoulos (University of Western Kentucky, Bowling Green, KY.) 1994 15 p Presented at the 13th International Conference on the Application of Accelerators in Research and Industry, Denton, TX, 7-10 Nov. 1994
(Contracts DE-FG22-93PC-93211; DE-AC05-84OR-21400)
(DE95-002601; CONF-941129-7) Avail: CASI HC A03/MF A01

It has been shown that explosives, illicit drugs, and other contraband materials contain various chemical elements in quantities and ratios that differentiate them from each other and from other innocuous substances. In coal, the major chemical elements in it can provide information about various parameters of importance to the coal industry. In both examples, the nondestructive identification of chemical elements can be performed by utilizing incident pulsed fast-thermal neutrons that, through nuclear reactions, excite the nuclei of the various elements. This technique is being currently developed for dismantling of nuclear weapons classified as trainer's, and for on-line coal bulk analysis. DOE

MUON DATA ANALYSIS PROGRAM RUMDA
S. H. Kilcoyne Jul. 1994 34 p
(PB95-129839; RAL-94-080) Avail: Issuing Activity (National Technical Information Service (NTIS))

There are currently two data analysis programs available for muon users at ISIS. Both programs can be used for analyzing MuSR and EMU data and can be run on (MUSR01), (EMU01) or set-up to run on a user's account. RUMDA - 'Reading University Muon Data Analysis' was originally from Reading University and is now controlled at ISIS. At present (mid 1994) this suite of programs is run using VAX/VMS and the ISIS plotting package 'GENIE'. It is possible to fit data to any function with a maximum of 10 variables. UDA - 'mu Data Analysis' is a dashboard driven program which allows the user to plot and fit data files on the screen or as hard copies. It is possible to fit data to a combination of Gaussian and/or Lorentzian line shapes. A manual describing this program can be found in the back of the MuSR User Guide. NTIS

PROGRAM WALKMAN: A CODE DESIGNED TO PERFORM ELECTRON SINGLE COLLISION ELASTIC SCATTERING MONTE CARLO CALCULATIONS
D. E. Cullen Aug. 1994 29 p
(Contract W-7405-eng-48)
(DE94-017501; UCRL-ID-118276) Avail: CASI HC A03/MF A01

The computer code WALKMAN performs electron single collision elastic scattering Monte Carlo calculations in spherical or planar geometry. It is intended as a research tool to obtain results that can be compared to the results of condensed history calculations. This code is designed to be self documenting, in the sense that the latest documentation is included as comment lines at the beginning of the code. Printed documentation, such as this document, is periodically published and consists mostly of a copy of the comment lines from the code. The user should be aware that the comment lines within the code are continually updated to reflect the most recent status of the code and these comments should always be considered to be the most recent documentation for the code and may supersede published documentation, such as this document. Therefore, the user is advised to always read the documentation within the actual code. The remainder of this report consists of example results and a listing of the documentation which appears at the beginning of the code. DOE

DIFFUSION ENHANCES SPONTANEOUS ELECTROWEAK BARYOGENESIS
A. G. Cohen (Boston Univ., MA.), D. B. Kaplan, and A. E. Nelson 1994 15 p
(Contracts DE-FG06-90ER-40561; DE-FG02-91ER-40676)
(DE94-017574; DOE/ER-40561/146; NSF-ITP-94-67) Avail: CASI HC A03/MF A01

We include the effects of diffusion in the electroweak spontaneous baryogenesis scenario and show that it can greatly enhance the resultant baryon density, by as much as a factor of 1/alpha(sub w)(sup 4) approximately equal to 10(exp 6) over previous estimates. Furthermore, the baryon density produced is rather insensitive to parameters characterizing the first order weak phase transition, such as the width and propagation velocity of the phase boundary. GAJET EXPERIMENT AT THE LHC: THE GAJET COLLABORATION
P. D. Dauncey, T. Nakada, and J. P. Perroud 19 Jul. 1994 33 p Second Workshop on B-Physics at Hadron Machines held in Le Mont Saint Michel, France, 24-29 Apr. 1994 Prepared in cooperation with Science Research Council, Daresbury, England; Paul Scherrer Inst., Villigen, Switzerland; and Lausanne Univ., Switzerland
(PB95-129813; RAL-94-076) Avail: Issuing Activity (National Technical Information Service (NTIS))

CP violation is one of few remaining phenomena which possibly may not be accommodated in the framework of the standard model. Although experiments with kaons will still dominate the scene for a while, the B-meson system provides the cleanest ground to test whether observed violation of CP symmetry is a sign of new physics or not. By the time LHC (Large Hadron Collider) will become fully operational, a CP violation effect in the theoretically cleanest and experimentally simplest decay mode B(sup 0) approaches J/(psi)K(sub s) could well have already been seen elsewhere, for example at e(+)e(-) B-meson factories, by HERA-B and at FNAL. Therefore, the aim of a dedicated B experiment at LHC must be to make precision measurements of all the three angles of the unitarity triangle. This requires a detector capable of identifying particles up to a high momentum, measuring accurately the decay time of the B-meson and triggering on various B-meson decay modes into a few charged particles. In order to realize such an experiment at the LHC, we chose a technique using an internal gas jet target (GAJET). In this paper, we discuss the reason of this choice, the proposed spectrometer, the trigger and the expected physics performance of the experiment. NTIS

RESEARCH IN THEORETICAL ELEMENTARY PARTICLE PHYSICS AT THE UNIVERSITY OF FLORIDA, TASK A
R. D. Field, P. M. Ramond, P. Sikivie, and C. B. Thorn 1 Nov. 1993 95 p
(Contract DE-FG05-86ER-40272)
(DE94-004373; DOE/ER-40272/194-Task-A; UFIFT-HEP-93-24-Task-A) Avail: CASI HC A05/MF A01

This is the Annual Progress Report of the theoretical particle theory group at the University of Florida under DOE Grant DE-FG05-86ER-40272. At present our group consists of four Full Professors (Field, Ramond, Thorn, Sikivie) and three Assistant Professors (Qiu, Woodard, Kennedy). Dallas Kennedy recently joined our group increasing the Particle Theory faculty to seven. In addition, we have three postdoctoral research associates, an SSC fellow, and eight graduate students. The research of our group covers a broad range of topics in theoretical high energy physics with balance between theory and phenomenology. Included in this report is a summary of the last several years of operation of the group and an outline of our current research program. DOE

SEARCH FOR D(+) YIELDS (PI)(+)(MU)(+)(MU)(-)
A. Nguyen et al Jul. 1994 4 p
(Contract DE-AC02-76CH-03000)
(DE94-015538; FNAL/C-94/187-E) Avail: CASI HC A01/MF A01

Flavor-changing neutral current decays are forbidden in lowest order in the Standard Model. The authors present results of a search for the charm changing neutral current decay D(+) (yields) (pi)(+)(mu)(+)(mu)(-) based on the analysis of one third of the data from Fermilab experiment E791, accumulated during the 1991-92 fixed target run with a 500 GeV negative pion beam incident on a segmented target. Assuming that the decay kinematics are the same as for D(+) (yields) K(-)(pi)(+)(pi)(+), they set an upper limit on the branching ratio for this channel, B(D(+) (yields) (pi)(+)(mu)(+)(mu)(-))less than 4.6 x 10(exp -5) at the 90% confidence level. DOE

N95-20476# Fermi National Accelerator Lab., Batavia, IL.
D(SUP 0)-(ANTI-D)(SUP 0) MIXING AND DOUBLY CABIBBO-SUPPRESSED DECAYS OF THE D(+)
M. V. Purohit et al Jul. 1994 11 p
(Contract DE-AC02-76CH-03000)
(DE94-015540; FNAL/C-94/186-E) Avail: CASI HC A03/MF A01

This report summarizes results from Fermilab experiment E791 on D(sup 0)-(anti D)(sup 0) mixing and doubly Cabibbo-suppressed decays of the D(+) meson. In order to search for D(sup 0)-(anti D)(sup 0) mixing, the authors use only D(sup 0) mesons from D(sup *+) decays in which case the charge of the pion from the D(sup *+) decay identifies the charm quantum number of the D(sup 0) at birth. When the D(sup 0) decays, the charge of the kaon identifies the charm quantum number and this way one can tell if mixing has occurred. This kind of search can be carried out by CLEO 2 as well and their conclusion was that there is some evidence of a wrong sign signal (0.77 +/- 0.25 +/- 0.25)% of the right sign signal. However, because of a lack of lifetime information, they cannot distinguish between doubly Cabibbo-suppressed decays which are expected at the level of the observed signal and mixing. They use their excellent lifetime sensitivity to obtain separate limits. During the past year, the authors have been working on extracting D(+) doubly Cabibbo-suppressed decay signals from E791's data sample. These decays are interesting both because they have never been observed and because definite predictions have been made about their rates, based on models of D mesons and their decay mechanisms. Preliminary analyses of 1/3 of the data have now been completed. Figure 3 shows the Cabibbo-favored signal D(+) (yields) K(-) (pi)(+)(pi)(+) and the next figure shows the signal in the doubly Cabibbo-suppressed mode D(+) (yields) K(+)(pi)(-)(pi)(-0). DOE

A NEW FAMILY OF ANION RECEPTORS AND THEIR EFFECTS ON ION PAIR DISSOCIATION AND CONDUCTIVITY OF LITHIUM SALTS IN NON-AQUEOUS SOLUTIONS
H. S. Lee, X. Q. Yang, J. McBreen, and Y. Okamoto (Polytechnic Univ., Brooklyn, NY.) 1994 13 p Presented at the 4th International Symposium on Polymer Electrolytes, Newport, RI, 19-24 Jun. 1994
(Contract DE-AC02-76CH-00016)
(DE94-016822; BNL-60409; CONF-940690-1) Avail: CASI HC A03/MF A01

A new family of anion receptors based on aza-ether compounds have been synthesized. Since the anion complexation of these compounds is not based on either positively charged sites or hydrogen bonding, they have a potential to be used in lithium batteries as electrolyte additives. When these compounds are added into nonaqueous electrolytes using lithium salts, such as LiCl/BF or LiBr/THF, the ionic conductivity can be dramatically increased. Near Edge X-ray Absorption Fine Structure (NF-XAFS) spectroscopy studies show that Cl(-) anions are completed with the nitrogen groups in these compounds. The increase in ionic conductivity and the degree of complexation, are both related to the number of R=CF3SO2 groups that are used to substitute the amine hydrogen atoms in these aza-ether compounds. DOE

PRODUCTION OF J/(PSI) IN 800 GeV/c p-SI INTERACTIONS
Jul. 1994 8 p
(Contract DE-AC02-76CH-03000)
(DE94-017982; FNAL/C-94/178-E) Avail: CASI HC A02/MF A01

The authors report on the analysis of high mass opposite sign dimuon states produced in pSi interactions at (radical)s = 38.7 GeV. These data have been collected with an open geometry fixed target spectrometer in the Fermilab Experiment E771. J/(psi) and (psi)(2S) total cross section sand J/(psi) x(sub f) and p(sub t) differential cross sections have been measured and compared with extrapolations from data at lower energies. Evidence for (Upsilon) meson production is also presented. DOE

N95-20554# George Washington Univ., Washington, DC. Dept. of Chemistry.
IDENTIFICATION OF RESONANT, TWO-ELECTRON, AND INTER-ATOMIC FEATURES IN K AND L23 NEXAFS SPECTRA Technical Report, Sep. 1993 - Oct. 1994
H. Sambe, X. Qian, David E. Ramaker, and W. E. OGrady Sep. 1994 9 p
(Contract N00014-94-I-0331)
(AD-A285374; TR-69) Avail: CASI HC A02/MF A01

Experimental Cl K NEXAFS spectra for Cl- hydrated in H2O, and on passivated Al electrodes (below and above the pitting potential) have widely different spectral line shapes. Experimental K- and L23-edge NEXAFS data for the alkali halides and rare gas solids are compared with FEFF6 calculated results to optimize code input parameters, test code validity, and identify many-body features in these model systems. Differences are shown to arise from many-body shake-up and charge-transfer excitations. Although relatively small in the model spectra, the latter interatomic excitations are believed to be primarily responsible for the different Cl- line shapes on the passivated Al electrodes. DTIC

AN ATOMICALLY-RESOLVED STM STUDY OF THE INTERACTION OF PHOSPHINE (PH3) WITH THE SILICON (001) SURFACE Interim Report, 1 Jun. 1993 - 31 May 1994
Y. Wang, J. Bronikowski, and R. J. Hamers 27 May 1994 21 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-1629)
(AD-A279819; TR-18) Avail: CASI HC A03

The interaction of phosphine (PH3) with the Si(001) surface has been investigated with scanning tunneling microscopy. At 300 K, PH3 adsorbs molecularly on top of a single Si=Si dimer with the phosphorus atom in a pentacoordinate configuration. Phosphine adsorption is accompanied by occasional ejection of silicon atoms from the substrate onto the surface, creating surface vacancies and Si adatoms. Si atoms are preferentially ejected from defect sites. At high coverage, adsorbed PH3 molecules order into small regions of c(4-by-2) symmetry and the ejected silicon nucleates into small dimer strings. The long-range order of the molecular PH 3 is disrupted by domain boundaries and the ejected silicon. Annealing PH 3- saturated surfaces produces further ejection of silicon onto the surface, resulting in large silicon islands covering approximately 20% of the surface. DTIC

ATOMICALLY RESOLVED STRUCTURE AND BONDING OF DELTA-DOPED BORON LAYERS ON SI(001) Interim Report, 1 Jun. 1993 - 31 May 1994
Y. Wang and R. J. Hamers 27 May 1994 10 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-1629)
(AD-A279820; TR-19) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Scanning tunneling microscopy has been used to study the formation of delta-doped layers by thermal decomposition of diborane on Si(001). STM images reveal a number of boron-induced reconstructions which arise from ordered arrangements of three structural subunits. Based on the symmetry of the STM images and the bonding locations of the observed features with respect to the Si(001) lattice, a structural model is proposed with accounts for the observed STM features. The principal structural subunit is shown to be an ordered arrangement of four boron atoms at substitutional sites in the first bulk-like silicon layer, which is then capped with ordered arrangements of silicon dimers and dimer vacancies. PUBLICATIONS/PATENTS/PRESENTATIONS/HONORS/STUDENT REPORT. INVESTIGATION OF THE ROLE OF VIBRATIONAL EXCITATION IN UNIMOLECULAR REACTIONS
Deanne Snavely 3 Jun. 1994 11 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-4130)
(AD-A280044) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Our overall goal is to investigate the nature of vibrationally energized molecules. Laser vibrational overtone activation produces energized molecules with specific vibrational excitation which undergo subsequent reaction. In these experiments the total pressure, excitation wavelength and collider gas are varied to determine the specific rate coefficient and collisional deactivation rate constants. Vibrational overtone spectroscopy of nonreactive molecules provides evidence of vibrational energy transfer pathways in reactive systems. Vibrational overtone excitation creates a narrow distribution of activated molecules compared to other forms of activation. This unique characteristic has allowed us to investigate the energy dependent reaction rate constant and the attributes of the collisional deactivation distribution in gaseous reactions. We have used laser vibrational excitation. We have determined the experimental specific rate coefficients for this reaction and compared them to the values predicted by RRKM theory. DTIC

LASER TRAPPING OF Na-21 ATOMS Ph.D. Thesis
Zheng-Tian Lu Sep. 1994 152 p
(Contract DE-AC03-76SF-00098)
(DE95-002354; LBL-36120) Avail: CASI HC A08/MF A02

This thesis describes an experiment in which about four thousand radioactive (21)Na (t(sub I/2) = 22 sec) atoms were trapped in a magneto-optical trap with laser beams. Trapped (21)Na atoms can be used as a beta source in a precision measurement of the beta-asymmetry parameter of the decay of (21)Na yields (21)Ne + (Beta)(sup +) + v(sub e), which is a promising way to search for an anomalous right-handed current coupling in charged weak interactions. Although the number of trapped atoms that we have achieved is still about two orders of magnitude lower than what is needed to conduct a measurement of the beta-asymmetry parameter at 1% of precision level, the result of this experiment proved the feasibility of trapping short-lived radioactive atoms. In this experiment, (21)Na atoms were produced by bombarding (24)Mg with protons of 25 MeV at the 88 in. Cyclotron of Lawrence Berkeley Laboratory. A few recently developed techniques of laser manipulation of neutral atoms were applied in this experiment. The (21)Na atoms emerging from a heated oven were first transversely cooled. As a result, the on-axis atomic beam intensity was increased by a factor of 16. The atoms in the beam were then slowed down from thermal speed by applying Zeeman-tuned slowing technique, and subsequently loaded into a magneto-optical trap at the end of the slowing path. The last two chapters of this thesis present two studies on the magneto-optical trap of sodium atoms. In particular, the mechanisms of magneto-optical traps at various laser frequencies and the collisional loss mechanisms of these traps were examined. DOE

ION SCATTERING AND DEPOSITION: THE ROLE OF ENERGETIC PARTICLES IN THIN FILM GROWTH Annual Report, 1 Sep. 1993 - 31 Aug. 1994
Barbara H. Cooper 31 Aug. 1994 3 p
(Contract F49620-93-1-0504)
(AD-A285975; AFOSR-94-0675TR) Avail: CASI HC A01/MF A01

Energetic ions or neutrals (in the hyperthermal energy range) have been used in a number of thin film growth applications (e.g., sputtering and plasma deposition techniques, direct ion beam and ion-assisted deposition, etc.). These involve both direct deposition of the film species with an ion beam, and deposition by some other method during simultaneous ion bombardment. Experiments and simulations have shown that energetic ions can lower the substrate temperature required to achieve crystallinity, can change growth morphologies, and influence structure and crystallographic orientation in the film. In many cases, the mechanisms responsible for ion-induced modification of growth are not understood at the atomic level. We have initiated both scattering and scanning tunneling microscopy (STM) studies to probe these mechanisms. DTIC

ULTRAFAST MAGNETOEXCITON DYNAMICS IN GaAs
M. A. Mycek, U. Siegner, and D. S. Chemla May 1994 4 p Presented at the International Quantum Electronics Conference, Anaheim, CA, 8-13 May 1994
(Contract DE-AC03-76SF-00098)
(DE94-018175; LBL-35207; CONF-9405219-3) Avail: CASI HC A01/MF A01

A bulk semiconductor provides an excellent system for optically studying the ultrafast dynamics of Coulomb correlated magnetoexcitons. The applications of magnetic field to a 3-D system quantizes the energy levels of states with momentum perpendicular to B and, in contradistinction to experiments performed on 2-D quantum well systems, leaves a 1-D continuum of states with momentum parallel to B. The presence of the continuum states has a dramatic influence on both the linear and nonlinear optical properties. Thus, the experiments described blow track the evolution of the semiconductor from a 3-D to a 1-D system and reveal surprising optical properties not observed in the previously reported studies in quantum wells. Using ultrashort pulsed wave mixing spectroscopy, the authors investigate coherent emission from magnetoexcitons in GaAs. By spectrally resolving the emission, they relate the non periodic beat observed temporally to quantum interferences, which they attribute to Coulomb interactions between magnetoexcitons. Contrary to experiments in quantum wells, these interactions persist for fields strengths up to 10T. DOE

SYMMETRY, WIGNER FUNCTIONS AND PARTICLE REACTIONS
M. P. Chavlejshvili 1994 14 p Presented at the 3rd International Wigner Symposium: Symmetry in Physics, Oxford, England, 1993
(DE94-629887; JINR-E-2-94-22) Avail: CASI HC A03/MF A01 (US Sales Only)

We consider the great principle of physics - symmetry - and some ideas, connected with it, suggested by a great physicist Eugene Wigner. We will discuss the concept of symmetry and spin, study the problem of separation of kinematics and dynamics in particle reactions. Using Wigner rotation functions (reflecting symmetry properties) in helicity amplitude decomposition and crossing-symmetry between helicity amplitudes (which contains the same Wigner functions) we get convenient general formalism for description of reactions between particles with any masses and spins. We also consider some applications of the formalism. DOE

QUANTIZATION IN CURVILINEAR COORDINATES
Kimihide Nishimura Jan. 1994 13 p
(DE94-770603; INS-1021) Avail: CASI HC A03/MF A01

The general covariant quantization method based on the equivalence principle is proposed. According to this method, it is found that an extra term: -1/3R appears in the Klein-Gordon equation. As a result, the effective mass of an electron, for example, will increase by the ratio of 10(exp -35) at the center of a neutron star. DOE

N95-20738# Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study.
UNIVERSAL PARAMETRIZATION FOR QUARK AND LEPTON SUBSTRUCTURE
Keiichi Akama (Saitama Univ., Urawa, Japan.) and Hidezumi Terazawa Jan. 1994 13 p
(DE94-770604; INS-1022) Avail: CASI HC A03/MF A01

A universal parametrization for possible quark and lepton substructure is advocated in terms of quark and lepton form factors. It is emphasized that the lower bounds on compositeness scale, (Lambda)(sub c), to be determined experimentally strongly depend on their definitions in composite models. From the recent HERA data, it is estimated to be (Lambda)(sub c) greater than 50 GeV, 0.4 TeV and 10 TeV, depending on the parametrizations with a single-pole form factor, a contact interaction and a logarithmic form factor, respectively. DOE

SEARCH FOR RIGHT-HANDED CURRENTS IN THE DECAY CHAIN OF K(+) YIELDS MUON(+)nu(SUB MUON), MUON(+) YIELDS e(+)nu(SUB e)nu(BAR)(SUB MUON)
M. Aoki, T. Yamazaki, and J. Imazato et al Dec. 1993 65 p
(DE94-770606; INS-1019) Avail: CASI HC A04/MF A01

The asymmetry of positrons in the K(+) yields mu(+)nu, mu(+) yields e(+)nu(sub e) nu-bar(sub mu) decay chain was measured in a search for right-handed weak currents in (Delta)S = 1 semi-leptonic decay. High-intensity low-background monoenergetic polarized muons of 236 MeV/c momentum resulting from kaon decay at rest were directly extracted from a primary production target which was hit by a proton beam of the KEK 12-GeV proton synchrotron. Muons were stopped in a pure-aluminum plate, and the energy-integrated asymmetry of the decay positrons with respect to the incoming muon direction was determined to high precision. The observed asymmetry yielded xi P(sub mu) = -0.9996 +/- 0.0030(stat) +/- 0.0048(sys). This result revealed no evidence of right-handed currents in this kaon-decay chain, and set a stringent bound on the mass of the right-handed weak boson. DOE

STUDY OF SMALL CARBON AND SEMICONDUCTOR CLUSTERS USING NEGATIVE ION THRESHOLD PHOTODETACHMENT SPECTROSCOPY Ph.D. Thesis
Caroline Chick Arnold Aug. 1994 308 p
(Contract DE-AC03-76SF-00098)
(DE95-002327; LBL-36197) Avail: CASI HC A14/MF A03

The bonding and electronics of several small carbon and semiconductor clusters containing less than ten atoms are probed using negative ion threshold photodetachment (zero electron kinetic energy, or ZEKE) spectroscopy. ZEKE spectroscopy is a particularly advantageous technique for small cluster study, as it combines mass selection with good spectroscopic resolution. The ground and low-lying electronic states of small clusters in general can be accessed by detaching an electron from the ground anion state. The clusters studied using this technique and described in this work are C6(-)/C6, Si(n)(-)/Si(n) (n = 2, 3, 4), Ge2(-)/Ge2, In2P(-)/In2P, InP2(-)/InP2, and Ga2As(-). The total photodetachment cross sections of several other small carbon clusters and the ZEKE spectrum of the I(-)(center dot)CH3I S(N)2 reaction complex are also presented to illustrate the versatility of the experimental apparatus. Clusters with so few atoms do not exhibit bulk properties. However, each specie exhibits bonding properties that relate to the type of bonding found in the bulk. C6, as has been predicted, exhibits a linear cumulenic structure, where double bonds connect all six carbon atoms. This double bonding reflects how important (pi) bonding is in certain phases of pure carbon (graphite and fullerenes). The symmetric stretch frequencies observed in the C6(-) spectra, however, are in poor agreement with the calculated values. Also observed as sharp structure in total photodetachment cross section scans was an excited anion state bound by only (approximately)40/cm relative to the detachment continuum. This excited anion state appears to be a valence bound state, possible because of the high electron affinity of C6, and the open shell of the anion. DOE

UNIVERSALITY OF PARTICLE MULTIPLICITIES
K. Goulianos Sep. 1994 12 p Presented at the 3rd Gleb Wataghin School on High Energy Henomenology, Campinas, Brazil, 11-16 Jul. 1994
(Contract DE-AC02-76CH-03000)
(DE95-000727; FNAL/C-94/266-E; CONF-9407134-1) Avail: CASI HC A03/MF A01

We discuss the scaling properties and universality aspects of the rapidity and multiplicity distributions of particles produced in high energy hadronic and e(+)e(-) interactions. This paper is based on material presented in three lectures on pomeron phenomenology, which included a review of traditional soft pomeron physics and selected topics on hard diffraction processes probing the structure function of the pomeron. EVIDENCE FOR t(BAR t) PRODUCTION AT THE TEVATRON: STATISTICAL SIGNIFICANCE AND CROSS SECTION
J. Koningsberg (Harvard Univ., Cambridge, MA.) Sep. 1994 7 p Presented at the Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM, 2-6 Aug. 1994
(Contract DE-AC02-76CH-03000)
(DE95-002524; FNAL/C-94/314-E; CONF-940816-46) Avail: CASI HC A02/MF A01

We summarize here the results of the 'counting experiments' by the CDF Collaboration in the search of t(bar t) production in p(bar p) collisions at square root of s = 1800 TeV at the Tevatron. We analyze their statistical significance by calculating the probability that the observed excess is a fluctuation of the expected backgrounds, and assuming the excess is from top events, extract a measurement of the t(bar t) production cross-section. DOE

AN ADVANCED ECR ION SOURCE WITH A LARGE UNIFORMLY DISTRIBUTED ECR PLASMA VOLUME FOR MULTIPLY CHARGED ION BEAM GENERATION
G. D. Alton and D. N. Smithe (Mission Research Corp., Newington, VA.) 1994 32 p Presented at the 6th International Symposium on Electron Beam Ion Sources and Their Applications, Stockholm, Sweden, 20-23 Jun. 1994
(Contract DE-AC05-84OR-21400)
(DE95-001078; CONF-9406180-4) Avail: CASI HC A03/MF A01

A new ECR ion source geometry has been conceived which uses a minimum-B magnetic mirror geometry consisting of a multi-cusp, magnetic field, to assist in confining the plasma radially, a flat central field for tuning to the ECR resonant condition, and specially tailored mirror fields in the end zones for confining the plasma in the axial direction. The magnetic field, designed to achieve an axially symmetric plasma 'volume' with constant mod-B, extends over the length of the central field region. This design, which strongly contrasts with 'surface' ECR zones characteristic of conventional ECR ion sources, results in dramatic increases in the adsorption of RF power, thereby increasing the electron temperature and 'hot' electron population within the ionization volume of the source. The ECR zone is concentrated symmetrically around the axis of symmetry and along the length of the plasma volume rather than in thin surface layers located off-axis as is the case in conventional ECR ion sources. The creation of a 'volume' rather than a 'surface' ECR zone and its distribution relative to the optical axis where the ions of interest are extracted is commensurate with the generation of higher beam intensities, higher charge states and a higher degree of ionization. The new ECR ion source concept has been computationally designed through the use of magnet design codes, plasma-dispersion sources, and particle-in-cell codes. A summary of the design attributes of the source is given in this report. DOE

RECENT RESULTS FROM E665
Ashutosh V. Kotwal (Harvard Univ., Cambridge, MA.) Sep. 1994 12 p Presented at the 6th Rencontres De Blois: The Heart of the Matter, Orsay, France, 10-25 Jun. 1994
(Contract DE-AC02-76CH-03000)
(DE95-002523; FNAL/C-94/345-E; CONF-9406265-2) Avail: CASI HC A03/MF A01

Preliminary measurements of the structure functions F(sub 2,sup p) and F(sub 2,sup d) and the structure function ratio F(sub 2,sup n)/F(sub 2,sup p), in inelastic mu-N scattering are presented. Preliminary results on nuclear transparency ((sigma)(sup A)/A)/(sigma)(sup H) in incoherent exclusive (rho) production are also presented. The data were obtained by Fermilab experiment 665 using a 465 GeV muon beam and liquid hydrogen, deuterium and carbon, calcium and lead targets. The structure functions are measured in the range x(sub Bj) greater than 8 X 10(exp -4) and Q(sup 2) greater than 0.2 GeV(sup 2). The structure function ratio is presented as a function of x(sub Bj) for x(sub Bj) greater than 10(exp -6). The nuclear transparency in exclusive (rho) production is studied as a function of Q(sup 2) in the range 0.1 less than Q(sup 2) less than 10.0 GeV(sup 2). DOE

CONSTRUCTION OF NON-CRITICAL STRING FIELD THEORY BY TRANSFER MATRIX FORMALISM IN DYNAMICAL TRIANGULATION
Yoshiyuki Watabiki Dec. 1993 67 p
(DE94-770607; INS-1017) Avail: CASI HC A04/MF A01

We propose a new method which analyzes the dynamical triangulation from the viewpoint of the non-critical string field theory. By using the transfer matrix formalism, we construct the non-critical string field theory (including c greater than 1 cases) at the discrete level. For pure quantum gravity, we succeed in taking the continuum limit and obtain the c = 0 non-critical string field theory at the continuous level. We also study about the universality of the non-critical string field theory. DOE

EVALUATION OF AN IMMOBILIZED CELL BIOREACTOR FOR DEGRADATION OF META- AND PARA-NITROBENZOATE Final Report, Jan. - Aug. 1993
Steven W. Peretti and Stuart M. Thomas 18 Jan. 1994 22 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A279719; AL/EQ-TR-1994-0012) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Meta- and para-nitrobenzoic acid are pollutants found in waste streams from metal-stripping processes using cyanide-free solvents. The Kelly AFB industrial Waste Treatment Plant (IWTP) is currently incapable of removing these compounds from its wastewaters because of the presence of significant quantities of ethylenediamine, a preferred substrate and upper limit of 4-5 hours on the hydraulic residence time in the IWTP. This report describes the enrichment and preliminary characterization of a microbial consortium capable of utilizing both Meta- and Para-Nitrobenzoate as sole carbon sources. DTIC

TEMPORAL REARRANGEMENT OF ELECTRONIC DENSITIES IN SLOW ATOMIC COLLISIONS
D. A. Micha 16 May 1994 20 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-93-1-0122)
(AD-A279725; TR-6) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Electronic rearrangement in atomic interactions involve two very different time scales, for nuclear (slow) and electronic (fast) motions. This requires special care when one calculates solutions to the corresponding coupled differential equations. A method has been developed to treat the coupling of very different time scales, based on density operators in Liouville space. Its implementation in terms of density matrices, within an eikonal/TDHF formulation, has allowed us to follow the time-evolution of atomic populations in ion-atom and ion-surface interactions. DTIC

ACTIVE NEUTRON MULTIPLICITY ANALYSIS AND MONTE CARLO CALCULATIONS
M. S. Krick, N. Ensslin, D. G. Langner, M. C. Miller, R. Siebelist, J. E. Stewart, R. N. Ceo (Martin Marietta Energy Systems, Inc., Oak Ridge, TN.), P. K. May (Martin Marietta Energy Systems, Inc., Oak Ridge, TN.), and L. L. Collins, Jr. (Martin Marietta Energy Systems, Inc., Oak Ridge, TN.) 1994 7 p Presented at the Institute of Nuclear Materials Management Annual Meeting, Naples, FL, 17-20 Jul. 1994
(Contract W-7405-eng-36)
(DE94-016178; LA-UR-94-2440; CONF-940748-63) Avail: CASI HC A02/MF A01

Active neutron multiplicity measurements of high-enrichment uranium metal and oxide samples have been made at Los Alamos and Y-12. The data from the measurements of standards at Los Alamos were analyzed to obtain values for neutron multiplication and source-sample coupling. These results are compared to equivalent results obtained from Monte Carlo calculations. An approximate relationship between coupling and multiplication is derived and used to correct doubles rates for multiplication and coupling. The utility of singles counting for uranium samples is also examined. DOE

ELECTRON-NUCLEAR DYNAMICS OF MOLECULAR SYSTEMS
Agustin Diz and Yngve Ohrn 1994 16 p Sponsored by ONR
(AD-A279649) Avail: CASI HC A03/MF A01

The content of an ab-initio time-dependent theory of quantum molecular dynamics of electrons and atomic nuclei is presented. Employing the time-dependent variational principle and a family of approximate state vectors yields a set of dynamical equations approximating the time-dependent Schrodinger equation. These equations govern the time evolution of the relevant state vector parameters as molecular orbital coefficients, nuclear positions and momenta. This approach does not impose the Born-Oppenheimer approximation, does not use potential energy surfaces and takes into account electron-nuclear coupling. Basic conservation laws are fully obeyed. The simplest model of the theory employs a single determinantal state for the electrons and classical nuclei and is implemented in the computer code ENDyne. Results from this ab-initio theory are reported for ion-atom and ion-molecule collisions. DTIC

DIELECTRIC MODELS IN ADHESION AND EXTRAPOLATIONS OF MOLECULAR MODELING Report, Jun. 1993 - Feb. 1994
Nancy E. Iwamoto Apr. 1994 40 p
(AD-A279675; NAWC-WPNS-TP-8152) Avail: CASI HC A03/MF A01

In order to separate mechanical mechanisms of adhesion such as surface roughness, chain entanglement, or even chemical reaction from mechanisms based upon the dielectric nature of interface interaction, highlights of dielectric theory dealing with cohesion and adhesion are reviewed. Elements of those theories are applied in order to gain insight into experimental results of adhesive systems taken from the literature. From this analysis dielectric-based explanations are offered for general adhesion trends, including explanations of metal to nonmetal adhesion trends based upon properties of the changing metal and the constituents of the interface. An example of how a dielectric-based explanation could be used to rationalize contributions from both the interface compositions and bulk components is also given. Finally an example of dynamic molecular modeling is given in order to compare current computer models of adhesion. DTIC

NEW METHODS FOR LARGE SCALE LOCAL AND GLOBAL OPTIMIZATION Final Report, 1 Dec. 1991 - 30 Nov. 1993
Richard Byrd and Robert Schnabel 8 Jul. 1994 9 p
(Grant AF-AFOSR-0109-90)
(AD-A285635; Rept-153-7645; AFOSR-94-0487TR) Avail: CASI HC A02/MF A01

We have pursued all three topics described in the proposal during this research period. A large amount of effort has gone into the development of large scale global optimization methods for molecular configuration problems. We have developed new general purpose methods that combine efficient stochastic global optimization techniques with several new, more deterministic techniques that account for most of the computational effort, and the success, of the methods. We have applied our methods to Lennard-Jones problems with up to 75 atoms, to water clusters with up to 31, molecules, and polymers with up to 58 amino acids. The results appear to be the best so far by general purpose optimization methods, and appear to be leading to some interesting chemistry issues. Our research on the second topic, tensor methods, has addressed several areas. We have designed and implemented tensor methods for large sparse systems of nonlinear equations and nonlinear least squares, and have obtained excellent test results on a wide range of problems. We have also developed new tensor methods for nonlinearly constrained optimization problem, and have obtained promising theoretical and preliminary computational results. Finally, on the third topic, limited memory methods for large scale optimization, we have developed and implemented new, extremely efficient limited memory methods for bound constrained problems, and new limited memory trust regions methods, both using our-recently developed compact representations for quasi-Newton matrices. Computational test results for both methods are promising. DTIC

BEHAVIOUR OF SPACE-CHARGE DOMINATED ION BEAMS IN STORAGE RINGS
A. F. Haffmans, D. Maletic, and A. G. Ruggiero 1994 4 p Presented at the 4th European Particle Accelerator Conference, London, England, 27 Jun. - 1 Jul. 1994
(Contract DE-AC02-76CH-00016)
(DE94-015845; BNL-49992; CONF-940618-23) Avail: CASI HC A01/MF A01

The interparticle repulsion, or space charge, limits the density of charged particle beams that can be obtained in storage rings. In this report we study the effect of increasing the space charge, with an exact computation of the lattice parameters using SYNCH. Systematically increasing the ion density by decreasing the emittance with cooling techniques lowers the betatron tune, until the lower half-integral stopband resonance - also induced by the beam is reached. In the simple model described in the report, the amount of 'cooling' is limited by the encountered stopband of the lattice. Therefore, machines with a higher tune and larger periodicity are better suited to store beams with high space charge. DOE

ADVANCED CONCEPTS FOR GAMMA RAY ISOTOPIC ANALYSIS AND INSTRUMENTATION
W. M. Buckley and J. B. Carlson Jul. 1994 5 p Presented at the Institute of Nuclear Materials Management Annual Meeting, Naples, FL, 17-20 Jul. 1994
(Contract W-7405-eng-48)
(DE94-016610; UCRL-JC-116145; CONF-940748-78) Avail: CASI HC A01/MF A01

The Safeguards Technology Program at the Lawrence Livermore National Laboratory is developing actinide isotopic analysis technologies in response to needs that address issues of flexibility of analysis, robustness of analysis, ease-of-use, automation and portability. Recent developments such as the Intelligent Actinide Analysis System (IAAS), begin to address these issues. We are continuing to develop enhancements on this and other instruments that improve ease-of-use, automation and portability. Requests to analyze samples with unusual isotopics, contamination, or containers have made us aware of the need for more flexible and robust analysis. We have modified the MGA program to extend its plutonium isotopic analysis capability to samples with greater Am-241 content or U isotopics. We are looking at methods for dealing with tantalum or lead contamination and contamination with high-energy gamma emitters, such as U-233. We are looking at ways to allow the program to use additional information about the sample to further extend the domain of analyzable samples. These unusual analyses will come from the domain of samples that need to be measured because of complex reconfiguration or environmental cleanup. DOE

HEAVY ION TRACK-STRUCTURE CALCULATIONS FOR RADIAL DOSE IN ARBITRARY MATERIALS
Francis A. Cucinotta, Robert Katz (Nebraska Univ., Lincoln, NE.), John W. Wilson, and Rajendra R. Dubey (Old Dominion Univ., Norfolk, VA.) Feb. 1995 21 p
(RTOP 199-45-16-11)
(NASA-TP-3497; L-17424; NAS 1.60:3497) Avail: CASI HC A03/MF A01

The delta-ray theory of track structure is compared with experimental data for the radial dose from heavy ion irradiation. The effects of electron transmission and the angular dependence of secondary electron ejection are included in the calculations. Several empirical formulas for electron range and energy are compared in a wide variety of materials in order to extend the application of the track-structure theory. The model of Rudd for the secondary electron-spectrum in proton collisions, which is based on a modified classical kinematics binary encounter model at high energies and a molecular promotion model at low energies, is employed. For heavier projectiles, the secondary electron spectrum is found by scaling the effective charge. Radial dose calculations for carbon, water, silicon, and gold are discussed. The theoretical data agreed well with the experimental data. Author

ANOMALOUS VECTOR-BOSON COUPLINGS IN MAJORANA NEUTRINO MODELS
C. P. Burgess and A. Pilaftsis Jun. 1994 17 p Prepared in cooperation with Neuchatel Univ., Switzerland
(PB95-127460; RAL-94-053) Avail: Issuing Activity (National Technical Information Service (NTIS))

We examine the contributions of Majorana neutrinos to CP-violating WWZ and ZZZ self-couplings, using a model in which sterile neutrinos couple to the W and Z by mixing with a fourth-generation heavy lepton. We find that the induced form factors can be as large as 0.5%. The model satisfies all phenomenological bounds in a natural way, including those due to the strong limits on the neutron and electron electric dipole moments. Anomalous CP-odd couplings of this size are unlikely to be observed at LEP200, but might be detectable at NLC. NTIS

WHERE ARE WE GOING WITH BOSE-EINSTEIN: A MINI REVIEW
S. Haywood Jul. 1994 43 p
(PB95-130308; RAL-94-074) Avail: Issuing Activity (National Technical Information Service (NTIS))

In this paper, the author considers the progress (or otherwise) in understanding the Bose-Einstein effect in the context of high energy e(+)e(-) interactions. The agreement between published experimental results is poor, and there are difficulties in explaining the observations theoretically, especially in the light of resonance narrowing. Systems of more than two pions are investigated using event-weights, and the expected distortion of the rho(exp 0) is considered. This paper is written from the perspective of an experimentalist. It seeks to highlight the experimental problems and draw attention to relevant theoretical literature. NTIS

T1F ((1) SIGMA (+)): SOME PRELIMINARY ELECTRONIC STRUCTURE CALCULATIONS
S. Wilson, D. Moncrieff, and J. Kobus Jul. 1994 17 p Workshop on Parity Non-Conservation, Oxford, England, 7-10 Apr. 1994 Prepared in cooperation with Florida State Univ., Tallahassee, FL, and Nicolaus Copernicus Univ., Torun, Poland
(Contract DE-FC05-85ER-25000)
(PB95-130316; RAL-94-082) Avail: Issuing Activity (National Technical Information Service (NTIS))

Some preliminary calculations, using the matrix Hartree-Fock model, for the ground (X singlet Sigma +) state of the thallium fluoride molecule are presented. The convergence of the calculations, carried out within the algebraic approximation, is monitored by employing systematically constructed basis sets of increasing size. The importance of bond centered functions is emphasized. For diatomic molecules containing light atoms, the finite difference method has proved useful in calibrating calculations carried out with finite basis sets. The prospects for finite difference calculations for diatomic systems containing heavy atoms is assessed. NTIS

MULTIPLE HARD INTERACTIONS IN HERWIG
J. M. Butterworth and J. R. Forshaw Aug. 1994 8 p Presented at the Workshop on Two-Photon Physics at LEP and HERA, Lund, Sweden, May 1994 Prepared in cooperation with Pennsylvania State Univ., State College, PA
(PB95-130548; RAL-94-088) Avail: Issuing Activity (National Technical Information Service (NTIS))

At HERA energies, photoproduction of jets is sensitive to very high parton densities and so the probability of more than one hard partonic scattering occurring in a single photon-proton collision may be significant. This effect has been simulated using an eikonal prescription for the generation of the hard processes and the HERWIG parton showering and hadronization models. The first results on simulated jet cross sections indicate that the effect could be important when interpreting measurements of jet cross sections at HERA, and that the presence of a significant amount of multiple hard interactions could be directly confirmed by experiment. The measurement of parity nonconservation (PNC) in atoms constitutes an important test of electroweak interactions in nuclei. Great progress has been made over the last 20 years in performing these measurements with ever increasing accuracies. To date the experimental accuracies have reached a level of 1 to 2%. In all cases, except for cesium, the theoretical atomic structure uncertainties now limit the comparison of these measurements to the predictions of the standard model. New measurements involving the ratio of Stark interference transition rates for a series of Cs or Fr radioisotopes are foreseen as a way of eliminating these atomic structure uncertainties. The use of magneto-optical traps to collect and concentrate the much smaller number of radioactive atoms that are produced is considered to be one of the key steps in realizing these measurements. Plans for how these measurements will be done and progress made to date are outlined. DOE

A NEUTRON BEAM POLARIZER FOR STUDY OF PARITY VIOLATION IN NEUTRON-NUCLEUS INTERACTIONS
S. I. Penttilae, J. D. Bowman, C. M. Frankle, S. J. Seestrom, Yi-Fen Yen, P. P. J. Delheij (Tri-Univ. Meson Facility, Vancouver, British Columbia.), D. G. Haase (North Carolina State Univ., Raleigh, NC.), and H. Postma (Technische Hogeschool, Delft, Netherlands.) 1994 9 p Presented at the International Symposia on High Energy Spin Physics and Polarization Phenomena in Nuclear Physics, Bloomington, IN, 15-22 Sep. 1994
(Contract W-7405-eng-36)
(DE95-002743; LA-UR-94-3579; CONF-9409103-3) Avail: CASI HC A02/MF A01

A dynamically-polarized proton target operating at 5 Tesla and 1 K has been built to, neutron beam for studies of parity violation in compound-nuclear resonances. Nearly 0.9 proton polarization was obtained in an electron-beam irradiated ammonia target. This was used to produce a neutron beam polarization of 0.7 at epithermal energies. The combination of the polarized proton target and the LANSCE spallation neutron source produces the most intense pulsed polarized epithermal neutron beam in the world. The neutron-beam polarizer is described and methods to determine neutron beam polarization are presented. DOE

MEASURING A(SUB b) WITH POLARIZED BEAMS AT SLC
Thomas R. Junk May 1994 9 p Presented at the 29th Moriond Meeting on Quantum Chromodynamics and High Energy Hadronic Interactions, Les Arcs, France, 12-26 Mar. 1994
(Contract DE-AC03-76SF-00515)
(DE95-002865; SU-SLAC-PUB-6513; CONF-940327-14) Avail: CASI HC A02/MF A01

We present the first direct measurement of the left-right asymmetry of b-quarks from the decay of Z(sup 0) bosons produced in the annihilation of longitudinally polarized electrons and unpolarized positrons in the SLD at the SLC. Two complementary techniques are presented: (1) Z(sup 0) (yields) b(bar b) decays are tagged using track impact parameters measured with a CCD-based vertex detector with b - (bar b) discrimination provided by momentum-weighted track charge; (2) Semileptonic b-decays are tagged using high (P, P(sub T)) muons and electrons with b - (bar b) discrimination provided by the lepton charge. In our 1993 sample of (approximately)50,000 Z(sup 0) decays having a luminosity-weighted average e(-) polarization of (62.6 +/- 1.2)%, we find the following preliminary results: A(sub b)(track charge) = 1.01 +/- 0.12(stat) +/- 0.14(sys), (A sub b)(muons) = 0.94 +/- 0.25(stat) +/- 0.11(sys), and A(sub b)(electrons) 0.99 +/- 0.27(stat) +/- 0.19(sys). SOURCES OF AMPLITUDE-DEPENDENT TUNE SHIFT IN THE PEP-2 DESIGN AND THEIR COMPENSATION WITH OCTUPOLES
E. Forest, D. Robin, A. Zholents, M. Donald (Stanford Linear Accelerator Center, CA.), R. Helm (Stanford Linear Accelerator Center, CA.), J. Irwin (Stanford Linear Accelerator Center, CA.), and H. Moshammer (Stanford Linear Accelerator Center, CA.) Jun. 1994 3 p Presented at the 4th European Particle Accelerator Conference, London, England, 27 Jun. - 1 Jul. 1994
(Contract DE-AC03-76SF-00098)
(DE94-018198; LBL-35791; CBP-89; CONF-940618-76) Avail: CASI HC A01/MF A01

Higher order contributions from sextupoles and dipole fringe fields, quadrupole fringe fields, kinematic terms in the Hamiltonian, and systematic or random multipole errors may degrade the dynamic aperture by shifting the particles in the tune plane in an undesired direction. The authors compare the various sources quantitatively and discuss their impact on the dynamic aperture of the PEP-2 low energy ring (LER) lattice. A tunable compensation scheme for the LER lattice which permits an independent control of the tune shift with amplitude in the two transverse planes is presented. DOE

A MEASUREMENT OF THE b(BAR b) CROSS SECTION AT CDF
I. Yu (Yale Univ., New Haven, CT.) Aug. 1994 5 p Presented at the Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM, 2-6 Aug. 1994
(Contract DE-AC02-76CH-03000)
(DE95-000642; FNAL/C-94/241-E; CONF-940816-25) Avail: CASI HC A01/MF A01

We report a measurement of the b(bar b) cross section at CDF from the 1992-1993 run of the Tevatron Collider. Dimuon events from inclusive b yields mu decays of b(bar b) pairs are used to obtain the cross section as a function of P(sub T)(b(sub 1)) and P(sub T)(b(sub 2)). The results are compared to the predictions of next-to-leading order QCD and are found to be consistent. DOE

MEASUREMENTS OF SCATTERING PROCESSES IN NEGATIVE ION: ATOM COLLISIONS
T. J. Kvale 27 Sep. 1994 32 p
(Contract DE-FG05-88ER-13971)
(DE95-000664; DOE/ER-13971/23) Avail: CASI HC A03/MF A01

This report describes the progress made on the research objectives during the past three years of the grant. This research project is designed to study various scattering processes which occur in H(-) collisions with atomic (specifically, noble gas and atomic hydrogen) targets in the intermediate energy region. These processes include: elastic scattering, single- and double-electron detachment, and target excitation/ionization. For the elastic and target inelastic processes where H(-) is scattered intact, the experimental technique of ion energy-loss spectroscopy (IELS) will be employed to identify the final target state(s). In most of the above processes, cross sections are unknown both experimentally and theoretically. The measurements will provide total cross sections (TCS) initially, and once the angular positioning apparatus is installed, will provide angular differential cross sections (ADCS). DOE

NONPERTURBATIVE ASPECTS OF THE QUARK-PHOTON VERTEX
Michael R. Frank 1994 28 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-FG06-90ER-40561)
(DE94-012846; DOE/ER-40561/131) Avail: CASI HC A03

The electromagnetic interaction with quarks is investigated through a relativistic, electromagnetic gauge-invariant treatment. Gluon dressing of the quark-photon vertex and the quark self-energy functions is described by the inhomogeneous Bethe-Salpeter equation in the ladder approximation and the Schwinger-Dyson equation in the rainbow approximation respectively. Results for the calculation of the quark-photon vertex are presented in both the time-like and space-like regions of photon momentum squared, however emphasis is placed on the space-like region relevant to electron scattering. The treatment presented here simultaneously addresses the role of dynamically generated q(bar-q) vector bound states and the approach to asymptotic behavior. The resulting description is therefore applicable over the entire range of momentum transfers available in electron scattering experiments. Input parameters are limited to the model gluon two-point function which is chosen to reflect confinement and asymptotic freedom and are largely constrained by the obtained bound-state spectrum. DOE

HEAVY ION COLLISIONS
Barbara V. Jacak 1994 11 p Presented at the 27th International Conference on High Energy Physics, Glasgow, United Kingdom, 21-27 Jul. 1994
(Contract W-7405-eng-36)
(DE95-002712; LA-UR-94-3468; CONF-940722-31) Avail: CASI HC A03/MF A01

Heavy ion collisions at very high energies provide an opportunity to recreate in the laboratory the conditions which existed very early in the universe, just after the big bang. We prepare matter at very high energy density and search for evidence that the quarks and gluons are deconfined. I describe the kinds of observables that are experimentally accessible to characterize the system and to search for evidence of new physics. A wealth of information is now available from CERN and BNL heavy ion experiments. I discuss recent results on two particle correlations, strangeness production, and dilepton and direct photon distributions. DOE

EXCLUSIVE PROCESSES: TESTS OF COHERENT QCD PHENOMENA AND NUCLEON SUBSTRUCTURE AT CEBAF
Stanley J. Brodsky Jul. 1994 16 p Presented at the Workshop on CEBAF At Higher Energies, Newport News, VA, 14-16 Apr. 1994
(Contract DE-AC03-76SF-00515)
(DE95-002892; SU-SLAC-PUB-6570; CONF-9404197-2) Avail: CASI HC A03/MF A01

Measurements of exclusive processes such as electroproduction, photoproduction, and Compton scattering are among the most sensitive probes of proton structure and coherent phenomena in quantum chromodynamics. The continuous electron beam at CEBAF, upgraded in laboratory energy to 10-12 GeV, will allow a systematic study of exclusive, semi-inclusive, and inclusive reactions in a kinematic range well-tuned to the study of fundamental nucleon and nuclear substructure. I also discuss the potential at CEBAF for studying novel QCD phenomena at the charm production threshold, including the possible production of nuclear-bound quarkonium. DOE

DILEPTON PRODUCTION FROM p-p TO Ca-Ca AT THE BEVALAC
Howard S. Matis, S. Beedoe (California Univ., Los Angeles, CA.), M. Bougteb (Universite Blaise Pascal, Aubiere, France.), J. Carroll (California Univ., Los Angeles, CA.), W. Christie (Johns Hopkins Univ., Baltimore, MD.), W. Gong, T. Hallman (Johns Hopkins Univ., Baltimore, MD.), L. Heilbronn, H. Huang, and P. N. Kirk (Louisiana State Univ., Baton Rouge, LA.) Jun. 1994 6 p Presented at the Conference on Nucleus-Nucleus Collisions, Catania, Italy, 30 May - 4 Jun. 1994
(Contracts DE-AC03-76SF-00098; DE-FG03-88ER-40424; DE-FG02-88ER-40413; DE-FG05-88ER-40445)
(DE95-002341; LBL-36033; CONF-940509-7) Avail: CASI HC A02/MF A01

The DLS collaboration has recently completed a high statistics study of dilepton production at the Bevalac. In particular, we have measured dielectrons e(+)e(-) from p-p and p-d collisions to understand the basic dilepton production mechanisms in the energy range from 1.05-4.9 GeV. These data can be used to determine the basic processes which contribute to nucleon-nucleon dilepton production such as hadronic bremsstrahlung, vector meson processes, and hadronic Dalitz decay. The data show that a simple elastic bremsstrahlung calculation is insufficient to explain the data. Theoretical models are compared with the data. A new high statistics study of Ca-Ca at 1.05 A(center dot)GeV has been made to study the collectivity of A-A collisions. DOE

MAGNETIC X-RAY CIRCULAR DICHROISM IN SPIN-POLARIZED PHOTOELECTRON DIFFRACTION
G. D. Waddill, J. G. Tobin, X. Guo, and S. Y. Tong 12 Jul. 1994 5 p Presented at the 8th International Conference on X-ray Absorption Fine Structure, Berlin, Germany, 8 Aug. - 2 Sep. 1994
(Contracts W-7405-eng-48; DE-FG02-84ER-45076)
(DE95-002394; UCRL-JC-117613; CONF-9408131-4) Avail: CASI HC A01/MF A01

The first structural determination with spin-polarized, energy-dependent photoelectron diffraction using circularly-polarized x rays is reported for Fe films on Cu(001). Circularly-polarized x rays produced spin-polarized photoelectrons from the Fe 2p doublet, and intensity asymmetries in the 2p(sub 3/2) level are observed. Fully spin-specific multiple scattering calculations reproduced the experimentally-determined energy and angular dependences. A new analytical procedure which focuses upon intensity variations due to spin-dependent diffraction is introduced. A sensitivity to local geometric and magnetic structure is demonstrated. DOE

PHOTOEMISSION AND FERROMAGNETISM
P. D. Johnson 1994 19 p
(Contract DE-AC02-76CH-00016)
(DE95-002419; BNL-60934) Avail: CASI HC A03/MF A01

Photoemission is a well established technique for the study of the electronic structure of atoms and solids. In particular, angle-resolved photoemission has been used extensively to map the band structure of clean and adsorbate covered surfaces, both metal and semiconductor. Extending the technique by measuring the spin of the photoemitted electrons allows the possibility of examining the exchange split band structures characterizing ferromagnetic systems. Here the technique becomes particularly useful in the study of the magnetic properties of surfaces, thin films and associated interfaces. DOE

CALCULATION OF ATOM-CENTERED PARTIAL CHARGES FOR HEME

John I. Manchester, Mark D. Paulsen, and Rick L. Ornstein May 1994 8 p Presented at the 27th Jerusalem Symposium in Quantum Chemistry and Biochemistry, Jerusalem, Israel, 23-26 May 1994
(Contract DE-AC06-76RL-01830)
(DE94-014447; PNL-SA-24303; CONF-9405196-1) Avail: CASI HC A02/MF A01

Atom-centered partial charges are calculated for the Fe-heme in cytochrome P450cam for use in molecular dynamics simulations of polar substrates bound in the active site of the enzyme. Charges are fit to the electrostatic potential produced by ab initio UHF wavefunctions for an Fe-porphine model. Basis set dependence of these charges is observed using the LANL1DZ, LANL2DZ and augmented 6-31G levels of theory. Upon geometry optimization of the enzyme, these charge sets cause varying degrees of distortion of the porphyrin from its crystallographically observed conformation. Scaling the charges calculated from the augmented 6-31G basis by 75% reduces the heme distortion while preserving reasonable interactions with a polar substrate. A comparison of the calculated charges with other published values is presented. DOE

A HIGH-RATE FIXED-TARGET CHARM EXPERIMENT
Daniel M. Kaplan (University of Northern Illinois, De Kalb, IL.) Jul. 1994 8 p Presented at the Workshop on the Future of High Sensitivity Charm Experiments, Batavia, IL, 7-9 Jun. 1994
(Contract DE-AC02-76CH-03000)
(DE95-001767; FNAL/C-94/201; CONF-9406242-4) Avail: CASI HC A02/MF A01

In the P865 Letter of Intent, we have proposed a fixed-target experiment aimed at achieving high sensitivity to decays both of charm and of beauty. I describe here a revised version which is somewhat more optimized for charm and less so for beauty. The rationale for this change of emphasis is two-fold: by the time a new fixed-target experiment might run (approximately Year 2000), it is likely that studies of beauty at the level proposed in P865 will no longer be competitive; furthermore, it may well be that charm is even more interesting than beauty since the background to rare processes beyond the Standard Model is so much smaller in charm than in beauty. At this workshop, Pakvasa has emphasized that rare and forbidden processes such as D(sup 0) mixing, charm-changing neutral currents, and lepton-family-violating currents must exist at some level if we are ever to have an understanding of the fermion masses and mixings; some extensions of the Standard Model predict effects detectable at the level of sensitivity discussed here. SIMILARITIES AND DIFFERENCES IN STRANGENESS PRODUCTION AT BNL AND CERN
Grazyna Odyniec Sep. 1994 13 p Presented at the NATO Advanced Research Workshop on Hot Hadronic Matter: Theory and Experiment, Divonne-les-Bains, France, 27 Jun. - 1 Jul. 1994
(Contract DE-AC03-76SF-00098)
(DE95-002343; LBL-36219; CONF-9406274-1) Avail: CASI HC A03/MF A01

Relativistic heavy ion collisions provide, in principle, necessary conditions for the formation of the quark gluon plasma. Strangeness enhancement was among the announced specific signals expected from this new, hypothetical state of nuclear matter. Analysis of the first generation of experiments with light and medium sized ions have been completed. Results on strangeness production become precious handles to study in great detail what is actually happening. The current experimental situation is assessed. The emerging picture is still incomplete: however, open questions constrain requirements on future heavy ion experiments. DOE

EXPERIMENTAL STUDY OF INTERACTIONS OF HIGHLY CHARGED IONS WITH ATOMS AT keV ENERGIES
V. O. Kostroun 27 Apr. 1994 8 p
(Contract DE-FG02-86ER-13519)
(DE95-001807; DOE/ER-13519/8) Avail: CASI HC A02/MF A01

Experimental study of low energy, highly charged ions with other atomic species requires an advanced ion source such as an electron beam ion source (EBIS) or an electron cyclotron ion source (ECRIS). Five years ago we finished the design and construction of the Cornell superconducting solenoid, cryogenic EBIS (CEBIS). Since then, this source has been in continuous operation in a program whose main purpose is the experimental study of interactions of highly charged ions with atoms at keV energies. This progress report for the period February 16, 1993 to April 15, 1994 describes the work accomplished during this time in the form of short abstracts. DOE

N95-21443# Fermi National Accelerator Lab., Batavia, IL.
BORON NEUTRINO FLUX AND THE MSW SOLUTION OF THE SOLAR NEUTRINO PROBLEM
P. I. Krastev (North Carolina Univ., Chapel Hill, NC.) and A. Y. Smirnov (Washington Univ., Seattle, WA.) 1994 19 p
(Contracts DE-FG06-90ER-40561; DE-FG05-85ER-40219)
(DE95-001861; FNAL/Pub-94/179-T; DOE/ER-40561/137) Avail: CASI HC A03/MF A01

There are large uncertainties in the predictions of the boron neutrino flux from the sun which cannot be considered as being of purely statistical origin. We treat the magnitude of this flux, Phi(sub B), as a parameter to be found from experiment. The properties of the MSW solution to the solar neutrino problem for different values of Phi(sub B) are studied. Present data give the bounds: 0.38 less than Phi(sub B)/Phi(sub B)(sup O) less than 3.1 (2 sigma), where Phi(sub B)(sup O) defined as 5.7 x 10(exp 6) cm(exp -2) s(exp -1) is the flux in the reference SSM. The variations of the flux in this interval enlarge the allowed region of mixing angles: sin(exp 2) 2 theta = 8 x 10(exp -4) / 2 x 10(exp -2) (small mixing solutions) and sin(exp 2) 2 theta = 0.2 / 0.85 (large mixing solution). If the value of the original boron neutrino flux is about that measured by Kamiokande, a consistent description of the data is achieved for sin(exp 2) 2 theta approximately (0.8/2) x 10(exp -3) ('very small mixing solution'). The solution is characterized by a strong suppression of the beryllium neutrino line, a weak distortion of the high energy part of the boron neutrino spectrum, and a value of the double ratio (CC/NC)(sup exp)/(CC/NC)(sup SSM) at E greater than 5 MeV close to 1. We comment on the possibility to measure the neutrino parameters and the original boron neutrino flux in future experiments. DOE

ON THE AHARONOV-BOHM EFFECT WITH NEUTRONS
Murray Peshkin 1994 8 p Presented at the Fundamental Problems in Quantum Theory, College Park, MD, 18-22 Jun. 1994
(Contract W-31-109-eng-38)
(DE95-002985; ANL/PHY/CP-84348; CONF-9406243-2) Avail: CASI HC A02/MF A01

The neutron interferometry phenomenon called scalar Aharonov-Bohm effect (SAB) follows from an ordinary local interaction, contrary to the usual Aharonov-Bohm effect with electrons (AB). I argue that SAB is not a topological effect by any useful definition. SAB in fact measures an apparently novel spin autocorrelation whose operator equations of motion contain the local torque in the magnetic field. The Aharonov-Casher effect shares these properties with SAB. DOE

STRANGE HADRONIC MATTER
A. Gal (Hebrew Univ., Jerusalem, Israel.) and C. B. Dover Sep. 1994 13 p Presented at the International Conference on Hypernuclear and

Strange Particle Physics, Vancouver, British Columbia, 4-8 Jul. 1994
(Contract DE-AC02-76CH-00016)
(DE94-019345; BNL-60795; CONF-940725-3) Avail: CASI HC A03/MF A01

Recent investigations of regions of stability for multi-strange hadronic systems, made up of nucleons and hyperons (p, n, Lambda, Xi(exp 0), Xi(exp -)) are reviewed. Relativistic mean field calculations, designed to reproduce the observed binding energies of ordinary nuclei and of Lambda, Xi, and Lambda Lambda hypernuclei, predict a large class of such objects which are stable against strong decay, including the bulk limit A approaches infinity, with binding energies as E(sub B)/A approximately -22 MeV, large strangeness per baryon f(sub s) 1-1.2, small charge per baryon f(sub q) approximately -0.1 to 0 and with baryon densities 2-3 times that of ordinary nuclear matter. A straightforward extension of the Bethe-Weizsacker mass formula into the strange domain accounts satisfactorily for all of these features. DOE

MONOPOLES AND QUARK CONFINEMENT: INTRODUCTION AND OVERVIEW
Ken Yee 20 Feb. 1994 20 p Presented at the Lake Louise Winter Institute Conference, Alberta, 20-26 Feb. 1994
(Contract DE-FG05-91ER-40617)
(DE94-019348; DOE/ER-40617/167; CONF-9402102-1) Avail: CASI HC A03/MF A01

We (try to) pedagogically explain how monopoles arise in QCD, why maximal Abelian (MA) gauge is 'special' for monopole study, the Abelian projection in MA gauge, its resultant degrees of freedom (photons, monopoles and charged matter fields), and the QCD-equivalent action in terms of these degrees of freedom. Then we turn to more recent developments in the subject: Abelian dominance, large N behavior of Abelian projected QCD, mass of the charged matter fields, notion of an effective photon-monopole action obtained by integrating out the charged matter fields, and problems encountered in evaluating this effective action using the microcanonical demon method on the lattice. DOE

QUANTUM SIMULATION OF HETEROGENEOUS ELECTRON TRANSFER FREE ENERGIES AT THE WATER-METAL INTERFACE Technical Report, May 1993 - May 1994
Jay B. Straus and Gregory A. Voth 6 May 1994 38 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-92-J-1243)
(AD-A279279; TR-10) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The free energy for electron transfer is studied for the Fe(2+)/Fe(3+) charge transfer system at the water-Pt(111) interface. Classical adiabatic free energy curves are calculated along with an adiabatic curve based on the Anderson-Newns Hamiltonian. Reactive flux calculations are then performed on this curve to determine the effect of recrossings on the classical rate constant. These effects are not found to be large (Kappa approximately 0.6). The solvent model is then extended to a quantum mechanical path integral version and quantum adiabatic free energy curves are calculated. The resulting quantum effects are found to be quite significant, illustrating that the same electrode overpotential does not necessarily result from the same free energy curves for the classical and quantum mechanical solvent models. These results suggest that classical models for water may not be adequate, or at least need to be modified, for accurate simulations of heterogeneous electron transfer. DTIC

THE DIPHOTON PRODUCTION RATE IN (BAR p)p COLLISIONS AT THE SQUARE ROOT OF s = 1800 GeV
R. Blair Aug. 1994 5 p Presented at the Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM, 2-6 Aug. 1994
(Contract DE-AC02-76CH-03000)
(DE95-000559; FNAL/C-94/269-E; CONF-940816-20) Avail: CASI HC A01/MF A01

A measurement of the rate of prompt diphoton production in (bar p)p collisions at square root of s = 1800 GeV using the CDF detector is presented. The background from non-prompt sources is estimated using a sample of single photon candidate events. The results are compared to a next-to-leading order calculation by Bailey, et al. Both background and signal take on particular significance as an indicator of our ability to estimate the backgrounds affecting LHC low mass Higgs to diphoton searches. DOE

NEW SHOWER MAXIMUM TRIGGER FOR ELECTRONS AND PHOTONS AT CDF
D. Gerdes (Michigan Univ., Ann Arbor, MI.) Aug. 1994 6 p Presented at the Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM, 2-6 Aug. 1994
(Contracts DE-AC02-76CH-03000; DE-AC02-76ER-01112; W-31-109-eng-38)
(DE95-000563; FNAL/C-94/243-E; CONF-940816-21) Avail: CASI HC A02/MF A01

For the 1994 Tevatron collider run, CDF has upgraded the electron and photon trigger hardware to make use of shower position and size information from the central shower maximum detector. For electrons, the upgrade has resulted in a 50% reduction in backgrounds while retaining approximately 90% of the signal. The new trigger also eliminates the background to photon triggers from single-phototube discharge. DOE

ELECTRON ATTACHMENT TO EXCITED MOLECULES
L. G. Christophorou, L. A. Pinnaduwage, and P. G. Datskos (Tennessee Univ., Knoxville, TN.) 1993 28 p Presented at the NATO Advanced

Study Institute: Linking the Gaseous and Condensed Phases of Matter - the Behavior of Slow Electrons, Patras, Greece, 5-18 Sep. 1993
(Contract DE-AC05-84OR-21400)
(DE94-019124; CONF-930993-3) Avail: CASI HC A03/MF A01

Studies on electron attachment to molecules rotationally/vibrationally excited thermally or via infrared-laser excitation showed that the effect of internal energy of a molecule on its electron attachment properties depends on the mode-dissociative or nondissociative-of electron attachment. They quantified the effect of the internal energy of the molecule on the rate of destruction (by autodissociation or by autodetachment) of its parent transient anion. Generally, increases in ro-vibrational molecular energy increase the cross section for dissociative electron attachment and decrease the effective cross section for parent anion formation due mainly to increased autodetachment. These findings and their understanding are discussed. A discussion is given, also, of recent investigations of electron attachment to electronically excited molecules, especially photoenhanced dissociative electron attachment to long- and short-lived excited electronic states of molecules produced directly or indirectly by laser irradiation. These studies showed that the cross sections for dissociative electron attachment to electronically excited molecules usually are many orders of magnitude larger than those for the ground-state molecules. The new techniques that have been developed for such studies are briefly described also. DOE

MEASUREMENT OF W AND Z PRODUCTION CROSS-SECTIONS IN p(BAR p) COLLISIONS AT (RADICAL)S = 1.8 TeV
Paul Z. Quintas Sep. 1994 6 p Presented at the Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM, 2-6 Aug. 1994
(Contract DE-AC02-76CH-03000)
(DE95-002250; FNAL/C-94/341-E; CONF-940816-40) Avail: CASI HC A02/MF A01

The cross sections for W and Z production in p(bar p) collisions at (radical)s = 1.8 TeV are measured using the DO detector at the Fermilab Tevatron collider. The detected final states are W (yields) ev(sub e), Z (yields) e(+)ɘ(-), W (yields) (mu)v(sub (mu)), and Z (yields) (mu)(+)(mu)(-). In the ratio of these measurements, many common sources of systematic error cancel and we measure R = (sigma),(p(bar p) (yields) W) (center dot) Br(W (yields) lv)/ (sigma),(p(bar p) (yields) Z) (center dot) Br(Z (yields) l(+)l(-). Assuming standard model couplings, this result is used to determine the width of the W bosom and to set a limit on the decay W(+) (yields) t(bar b). DOE

POLARIZATION OF CHARMONIUM IN PION-NUCLEUS COLLISIONS
Wai-Keung Tang Sep. 1994 3 p Presented at the International Symposia on High Energy Spin Physics and Polarization Phenomena in Nuclear Physics, Bloomington, IN, 15-22 Sep. 1994
(Contract DE-AC03-76SF-00515)
(DE95-002783; SU-SLAC-PUB-6665; CONF-9409103-2) Avail: CASI HC A01/MF A01

Measurements of the polarization of J/(psi) produced in pion-nucleus collisions are in disagreement with leading twist QCD prediction were J/(psi) is observed to have negligible polarization whereas theory predicts substantial polarization. We argue that this discrepancy cannot be due to poorly known structure functions nor the relative production rates of J/(psi) and X(sub J). The disagreement between theory and experiment suggests important higher twist corrections, as has earlier been surmised from the anomalous non-factorized nuclear A-dependence of the J/(psi) cross section. DOE

MEASUREMENT OF THE B MESON DIFFERENTIAL CROSS-SECTIONS IN p(BAR p) COLLISIONS AT (RADICAL)s = 1.8 TeV USING THE EXCLUSIVE DECAYS B(SUP (+-)) (YIELDS) J/(PSI)K(SUP (+-)) AND B(SUP 0) (YIELDS) J/(PSI)K*(SUP 0)
M. W. Bailey Aug. 1994 5 p Presented at the Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM, 2-6 Aug. 1994
(Contract DE-AC02-76CH-03000)
(DE94-018993; FNAL/C-94/237-E; CONF-940816-17) Avail: CASI HC A01/MF A01

This paper presents the first measurement of the differential B(+/-)and B(exp 0) cross-sections, d(sigma)/d(sub PT) in p(bar-p) collisions at (radical)s = 1.8 TeV. The data sample used represents an integrated luminosity of 19.3 +/- 0.8 pb(exp -1) accumulated by the Collider Detector at Fermilab (CDF). The cross-sections are measured over the PT range 6-15 GeV/c in the central pseudorapidity region (verticle bar)eta(verticle bar) less than 1 by fully reconstructing the B meson decays B(+/-) yields J/psi K(exp *0), where the J/psi is required to decay to two muons, and the K(exp *0) is required to decay to K(+/-)pi(exp +/-). The results are compared to the theoretical QCD prediction calculated at next-to-leading order. DOE

MEASUREMENT OF THE B CROSS SECTION AT CDF VIA B SEMILEPTONIC DECAYS
Jonathan Lewis Sep. 1994 7 p Presented at the Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM, 2-6 Aug. 1994
(Contract DE-AC02-76CH-03000)
(DE95-002217; FNAL/C-94/274-E; CONF-940816-41) Avail: CASI HC A02/MF A01

Using data collected during the 1992-1993 collider run at Fermilab, CDF has reconstructed several hundred charmed mesons (D(0), D(+) D*(+) and D(sub s)) in association with leptons from B semileptonic decays. We report on a measurement of the cross section of B and B(sub s) mesons as a function of transverse momentum using this sample. The observation of a charmed meson eliminates many systematic uncertainties in the background subtraction inherent in previous measurements from inclusive lepton samples, and allows the backgrounds to be measured from the data. The B meson p(sub T) range probed by the lepton + charm technique is 18 GeV and above, and thus these measurements complement similar measurements at lower p(sub T) in the fully exclusive channels B yields J/(psi)K and B yields J/(psi)K*. Results are compared to other Tevatron measurements and Next-To-Leading-Order QCD predictions. DOE

DETECTION EFFICIENCY AND DARK PULSE RATE OF ROCKWELL (SSPM) SINGLE PHOTON COUNTERS
P. H. Eberhard, P. G. Kwiat, M. D. Petroff (Rockwell International Corp., Anaheim, CA.), M. G. Stapelbroek (Rockwell International Corp., Anaheim, CA.), and H. H. Hogue (Rockwell International Corp., Anaheim, CA.) Apr. 1994 4 p Presented at the International Conference on Applications of Photonic Technology, Sensing, Signal Processing and Communications, Ottawa, Ontario, 21-23 Jun. 1994
(Contract DE-AC03-76SF-00098)
(DE94-016872; LBL-35444; CONF-9406233-1) Avail: CASI HC A01/MF A01

This paper describes direct photon counting data on several pixels of the Rockwell solid-state photomultipliers (SSPM) detector array, about which absolute single photon detection efficiencies and time responses were reported previously by Kwiat et al. The new data shows a substantially larger efficiency, 85%, and suggests that damage in the optical fiber employed in the earlier data was responsible for the lower number, 70%. When the results of this paper are analyzed using reasonable assumptions, one concludes that several improvements of the SSPM detector are still possible to bring the photon counting efficiency close to or larger than 95%. AUGER SPECTROMETRY OF ATOMS AND MOLECULES
M. O. Krause 1994 19 p Presented at the Workshop on Atomic Physics at High Brilliance Light Sources, Argonne, IL, 23-24 Apr. 1994
(Contract DE-AC05-84OR-21400)
(DE94-018052; CONF-9404198-1) Avail: CASI HC A03/MF A01

The author discusses the importance of Auger spectrometry at synchrotron radiation centers. First, he explains how a high energy photon source such as the APS (Advanced Photon Source) could be used to help provide missing spectral information about the shell structure of some elements. The missing data occurs mainly at higher energies in the 1-10 keV ranges as for the K-shells of $Z = 30$ to 60 elements and the L-shells for $Z = 30$ to 100 elements. He explains how even though Auger electron spectrometry does not depend on synchrotron radiation it can greatly benefit from this variable photon source as it allows one to select the Auger line group that is most suitable for a specific purpose. Most significantly, a continuous photon source becomes indispensable when one is interested in threshold effects. Lastly, he discusses coherence effects between different inner-shell vacancy states by way of some recent work done at Daresbury. DOE

ATOM WAVE INTERFEROMETER Annual Report
D. Pritchard 13 May 1994 5 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-89-J-1207)
(AD-A279532) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

In the early part of the current grant period we made many improvements to the apparatus. We have used our now reliable separated beam atom interferometer to perform several pioneering measurements. Recent improvements in our fabrication techniques (at NNF) for 200nm period gratings with absolute phase stability over large areas, improvements in sensitivity and time response of our detector, and learning how to stretch thin foils extremely flat over 10 cm lengths have enabled us to operate our interferometer with a metal septum between the two separated components of the atom wave which interferes with itself at the third grating. By taking data in very short time intervals (two or three milliseconds) and improving the frequency response of our servo electronics, we have been able to overcome the effects of vibration, at least up to about 100 Hz, simply by storing the datum of each short period with other data taken at the same position (as measured with the laser interferometer). This has resulted in higher contrast for the fringes. DTIC

CHARGE DENSITY OF FRACTIONAL CHARGED QUASIPARTICLES IN THE COMPOSITE FERMION PICTURE
X. M. Chen (Tennessee Univ., Knoxville, TN.), X. Xia (Tennessee Univ., Knoxville, TN.), and J. J. Quinn Jul. 1994 5 p Presented at the Conference on the Application of High Magnetic Fields, Cambridge, MA, 8-12 Aug. 1994
(Contract DE-AC05-84OR-21400)
(DE94-018122; CONF-940847-3) Avail: CASI HC A01/MF A01

Two different models for quasiparticles of the nu = 1/3 Laughlin incompressible state are investigated in the Fermion-Chern-Simons picture. In the first model a quasielectron (quasihole) is induced by adiabatically introducing an infinitesimally thin flux tube parallel (antiparallel) to the external magnetic field. The charge density induced is calculated in linear response theory. The quasielectron (quasihole) of the second model is obtained by creating (annihilating) a composite fermion consisting of a real electron with two attached magnetic flux quanta. Both models give a same total charge +/- 1/3e for quasiparticles; but they produce different charge density distributions rho(r). The self-energies (Coulomb) of quasiparticles are discussed. DOE

INVESTIGATION OF DIRECT PHOTON PRODUCTION IN 200 A GeV S + Au REACTIONS
1994 6 p Presented at the 29th Moriond Meeting on Quantum Chromodynamics and High Energy Hadronic Interactions, Les Arcs, France, 12-26 Mar. 1994
(Contract DE-AC05-84OR-21400)
(DE94-018129; CONF-940327-10) Avail: CASI HC A02/MF A01

Direct thermal photons in the p(sub T) range of 0-5 GeV/c are expected to provide a sensitive probe of the early conditions of the Quark Gluon Plasma which may be formed in relativistic heavy ion collisions. The production of single photons in 200 A GeV S + Au reactions has been investigated using the 3,800 element Pb glass calorimeter of CERN experiment WA80. Neutral pi(exp 0) and eta cross sections have been measured via their two-photon decay branch yields. The measured pi(exp 0) and eta cross sections have been used to calculate the expected inclusive yield of decay photons. Excess photon yield, beyond that attributed to radiative decays and background sources, may be associated with thermal photon emission. Excess, 'direct' photon yields have been extracted from high-statistics S + Au photon data for different event centrality classes. A slight excess photon yield above that which may be accounted for by hadronic decays was observed for central events. DOE

N95-21715# Fermi National Accelerator Lab., Batavia, IL.
STATUS OF THE DO TOP SEARCH
Qizhong Li-Demarteau Sep. 1994 14 p Presented at the 14th Conference on Physics in Collision, Tallahassee, FL, 15-17 Jun. 1994
(Contract DE-AC02-76CH-03000)
(DE95-002214; FNAL/C-94/332; CONF-940693-3) Avail: CASI HC A03/MF A01

Preliminary new results on the top quark search with the DO experiment in (bar p)p collisions at (radical)s = 1.8 TeV for an integrated luminosity of 15.2 +/- 1.8 pb(exp -1) are reported. In this new analysis, which is optimized for high mass top search, a total of seven candidate events in the electron and muon dilepton decay channels (t(bar t) (yields) e(mu), ee and (mu)(mu)), single lepton decay channels (t(bar t) (yields) e + jets and t(bar t) (yields) (mu) + jets) without b tagging and single electron decay channel (t(bar t) (yields) e + jets) with b tagging have been observed. The estimated background is 4.7 +/- 1.0 events. If we assume the top quark has a mass of 180 GeV/c(exp 2), a t(bar t) production cross section of 3.2 +/- 3.9 pb with upper limit of 13 pb at 95% C.L. is obtained. DOE

A PRELIMINARY, PRECISE MEASUREMENT OF THE AVERAGE B HADRON LIFETIME
Jul. 1994 10 p Presented at the 27th International Conference on High Energy Physics, Glasgow, Scotland, 21-27 Jul. 1994
(Contracts DE-FG02-91ER-40676; DE-FG03-92ER-40701; DE-FG03-91ER-40618; DE-FG03-92ER-40689; DE-FG03-93ER-40788; DE-FG02-92ER-40715; DE-AC02-76ER-03069; DE-FG06-85ER-40224; DE-AC03-76SF-00515; DE-FG05-91ER-40627)
(DE95-001848; SU-SLAC-PUB-6586; CONF-940722-28) Avail: CASI HC A02/MF A01

The average B hadron lifetime was measured using data collected with the SLD detector at the SLC in 1993. From a sample of approximately 50,000 Z(sup 0) events, a sample enriched in Z(sup 0) yields b(bar-b) was selected by applying an impact parameter tag. The lifetime was extracted from the decay length distribution of inclusive vertices reconstructed in three dimensions. A binned maximum likelihood method yielded an average B hadron lifetime of (tau)(sub B) = 1.577 +/- 0.032(stat.) +/- 0.046(syst.) ps. DOE

NUCLEAR RESEARCH WITH THE ELECTROMAGNETIC PROBE
Z. E. Meziani Oct. 1994 10 p
(Contract DE-FG03-88ER-40439)
(DE95-001812; DOE/ER-40439/T2) Avail: CASI HC A02/MF A01

This is the final report on the research carried at Stanford University under contract DE-FG03-88ER-40439. All the work accomplished under this grant is reported in the publications listed as part of the Principal Investigator bibliography at the end of this report. In the last few years our research was directed at some of the forefront questions in nuclear physics. We investigated the nuclear medium effects on the intrinsic properties of bound nucleons, specifically the electromagnetic form factors. For these studies we performed a number of specialized electron scattering experiments with specific sensitivity to nuclear medium effects. At the next level of structure, elementary constituents of matter are quarks and gluons. Defining the energy regime where the quark-gluon description of nuclear systems becomes more relevant than the nucleon-meson description is of great importance in thoroughly understanding the nuclear structure. To explore this transition region, we studied the scaling region in the disintegration of the deuteron, the simplest nuclear system with high energy photons. Finally we focused on the investigation of the nucleon internal spin structure along with the test of the Bjoerken sum rule a fundamental sum rule of QCD. DOE

ANGULAR AND CHARGE STATE DISTRIBUTIONS OF HIGHLY CHARGED IONS SCATTERED DURING LOW ENERGY SURFACE-CHANNELING INTERACTIONS WITH Au(110)
F. W. Meyer, L. Folkerts, and S. Schippers 1994 18 p Presented at the 10th International Workshop of Inelastic Ion-Surface Collisions, Grand Targhee Resort, WY, 8-12 Aug. 1994
(Contract DE-AC05-84OR-21400)
(DE95-001348; CONF-9408150-2) Avail: CASI HC A03/MF A01

The authors have measured scattered projectile angular and charge state distributions for 3.75 keV/amu O(sup q+) (3 less than or equal to q less than or equal to 8) and 1.2 keV/amu Ar(sup q+) (3 less than or equal to q less than or equal to 14) ions grazingly incident along the zone axes 110 and the zone axes 100 directions of a Au(110) single crystal target. Scattered projectile angular distribution characteristics of surface channeling are observed. For both incident species, the dominant scattered charge fraction is neutral, which varies only by a few percent as a function of incident charge state. Significant O(-) formation is observed, which manifests a distinct velocity threshold. For incident Ar projectiles with open L-shells, the positive scattered charge fractions, while always less than about 10%, increase linearly with increasing number of initial L-shell vacancies. DOE

COMPARATIVE COMPUTATIONAL ANALYSIS OF SOME NITRAMINE AND DIFLUORAMINE STRUCTURES, DISSOCIATION ENERGIES AND HEATS OF FORMATION
Peter Politzer, Pat Lane, M. E. Grice, Monica C. Concha, and Paul C. Redfern 3 Nov. 1994 12 p Limited Reproducibility: More than 20%

of this document may be affected by microfiche quality
(Contract N00014-91-J-4057)
(AD-A286196) Avail: CASI HC A03

Density functional methods have been used to compute the optimized geometries, dissociation energies, and gas phase heats of formation of several difluoramines (in which the -NF2 is attached to a nitrogen) and the corresponding nitramines. The -NF2 groups are found to be pyramidal, in contrast to the planarity of the -NO2. In each instance, one N-F bond length is at least 0.1 A longer than the other, while the N-N bonds are anomalously short. For the molecules and properties studied, the effects of -NO2 and -NF2 (on nitrogen) do not differ dramatically. Replacing -N-NO2 by -N-NF2 affects the dissociation energies of other N-NO2 and C-NO2 bonds only slightly (2-3 kcal/mole); however the N-NF2 bonds are 3-6 kcal/mole stronger than the N-NO2 that were replaced. The difluoramine heats of formation are less positive, by 15-17 kcal/mole, than those of the corresponding nitramines. DTIC

CONSTRAINTS ON T-ODD AND P-EVEN HADRONIC INTERACTIONS FROM NUCLEON, NUCLEAR, AND ATOMIC ELECTRIC DIPOLE MOMENTS
W. C. Haxton, A. Hoering, and M. J. Musolf (Continuous Electron Beam Accelerator Facility, Newport New, VA.) 1994 33 p
(Contract DE-FG06-90ER-40561)
(DE94-012845; DOE/ER-40561/130) Avail: CASI HC A03/MF A01

We deduce constraints on time-reversal-noninvariant (TRNI), parity-conserving (PC) hadronic interactions from nucleon, nuclear, and atomic electric dipole moment (edm) limits. Such interactions generate edm's through weak radiative corrections. We consider long-ranged mechanisms, i.e., those mediated by meson exchanges in contrast to short-range two-loop mechanisms. We find that the ratio of typical TRNI.PC nuclear matrix elements to those of the strong interaction are approximately less than 10(exp -5), a limit about two orders of magnitude more stringent than those from direct detailed balance studies of such interactions. TWO-BAND MODEL DESCRIPTION OF ELECTROABSORPTION AND THIRD-HARMONIC GENERATION IN 1-D MX LINEAR CHAINS
Z. Shuai (Mons Univ., Belgium.), J. L. Bredas (Mons Univ., Belgium.), A. Saxena, J. T. Gammel, and A. R. Bishop 1994 3 p Presented at the International Conference on Science and Technology of Synthetic Metals, Seoul, Republic of Korea, 24-29 Jul. 1994
(Contract W-7405-eng-36)
(DE95-000932; LA-UR-94-3206; CONF-9407117-3) Avail: CASI HC A01/MF A01

Within a two-band model, the authors investigate the electroabsorption (EA) and third-harmonic generation (THG) processes in halogen-bridged mixed-valence Pt complexes: PtCl, PtBr and PtI. For PtCl, the theoretical THG spectrum shows three peaks, corresponding to (1) a three-photon resonance at 0.83 eV originating in a M(etal)-M(etal) transition; (2) a two-photon resonance at 1.5 eV from an M-M band-edge transition; and (3) a three-photon resonance at 1.6 eV from an M-X transition. The latter two peaks account well for the twin-peak structure seen experimentally. They show that the twin-peak intensity strongly decreases from PtCl to PtBr and disappears for PtI. They also discuss the theoretical EA spectra due to localized defects (polarons, bipolarons, kinks, and excitons). DOE

THE STATUS OF MOLECULES
T. Barnes (Tennessee Univ., Knoxville, TN.) 1994 10 p Presented at the 29th Moriond Meeting on Quantum Chromodynamics and High Energy Hadronic Interactions, Les Arcs, France, 12-26 Mar. 1994
(Contract DE-AC05-84OR-21400)
(DE95-000952; RAL-94-056; ORNL-CCIP-9408; CONF-940327-12) Avail: CASI HC A02/MF A01

This report summarizes the experimental and theoretical status of hadronic molecules, which are weakly-bound states of two or more hadrons. We begin with a brief history of the subject and discuss a few good candidates, and then abstract some signatures for molecules which may be of interest in the classification of possible molecule states. Next we argue that a more general understanding of 2 yields 2 hadron-hadron scattering amplitudes will be crucial for molecule searches, and discuss some of our recent work in this area. We conclude with a discussion of a few more recent molecule candidates (notably the f(sub o)(1710)) which are not well established as molecules but satisfy some of the expected signatures. DOE

CLASSICAL-QUANTUM CORRESPONDENCE FOR IONIZATION IN FAST ION-ATOM COLLISIONS
J. Burgdoerfer (Tennessee Univ., Knoxville, TN.) and C. O. Reinhold 1994 20 p Presented at the Symposium on Two-Center Effects in Ion-atom Collisions, Boulder, CO, 12-15 May 1994
(Contract DE-AC05-84OR-21400)
(DE95-000953; CONF-9405241-1) Avail: CASI HC A03/MF A01

We analyze the interplay between classical and quantum dynamics in ionization of atoms by fast charged particles. The convergence to the classical limit is studied as a function of the momentum transferred to the electron during the collision, the impact parameter, the energy and angle of the emitted electron, and the initial state of the target. One goal is to assess the validity of exact classical (CTMC) methods and approximate classical models such as the Thomson model. Applications to data for electron ejection at large angles are presented. The connection between collisional ionization by charged particles and ionization by half-cycle pulses is discussed. DOE

MARI MINI-MANUAL
S. M. Bennington and R. S. Eccleston 5 Sep. 1994 49 p
(PB95-134649; RAL-94-102) Avail: Issuing Activity (National Technical Information Service (NTIS))

The MARI spectrometer is funded by the Japanese Ministry of Education, Culture and Science (Monbusho) as part of the UK-Japan collaboration in neutron scattering. MARI is a direct geometry chopper spectrometer. It uses a Fermi chopper to monochromatic the incident neutron beam to give incident energies in the range 10 to 2000 meV. It is very similar in design to its sister machine HET, but with a detector bank that continuously covers the angular range from 3 to 135 degrees, MARI is able to map large regions of Q-E space in a single measurement. At present about 600 of the full complement of 1000 detectors are installed. All are 10 bar (3)He gas proportional counters and all come from the same manufacturer, this means that their efficiency and background are almost the same. The beam size at the sample position is 50 by 50 mm, but motorized jaws in the Fermi chopper pit and in the sample tank can be used to reduce this size. Chapter headings are the following: Introduction; The hardware on MARI; Controlling the Instrument; Data Analysis and Visualization; Appendices. NTIS

THERE MIGHT BE TWO KINDS OF DIBARYON
Fan Wang (Nanjing Univ., China.), Jia-lun Ping (Nanjing Univ., China.), and Terrance Goldman 1994 5 p Presented at the Intersections of Particle and Nuclear Physics, Saint Petersburg, FL, 31 May - 6 Jun. 1994
(Contract W-7405-eng-36)
(DE94-014417; LA-UR-94-2147; CONF-940514-3) Avail: CASI HC A01/MF A01

A new quark potential model, the quark delocalization and color screening model, is used for a systematic search of dibaryon candidates in the u, d and s three flavor world. The color screening results from unquenched lattice gauge calculations and quark delocalization similar to electron delocalization in molecular physics are included. Flavor symmetry breaking and channel coupling effects are studied. The model is constrained not only by the baryon ground state property but also by the N-N scattering phase shifts. The deuteron and the zero energy di-nucleon resonance are reproduced qualitatively. The model predicts that there might be two kinds of dibaryon states. Possible high spin dibaryon resonances are emphasized. DOE

TESTS OF STRUCTURE FUNCTIONS USING LEPTON PAIRS: W-CHARGE ASYMMETRY AT CDF
W. K. Sakumoto (Rochester Univ., NY.) Sep. 1994 4 p Presented at the 6th Rencontres De Blois: The Heart of the Matter, Orsay, France, 10-25 Jun. 1994
(Contract DE-AC02-76CH-03000)
(DE95-000560; FNAL/C-94/265-E; CONF-9406265-1) Avail: CASI HC A01/MF A01

Large asymmetry of W-bosons produced in p(bar-p) collisions has been measured using 19 039 W yields e nu and W yields mu nu decays recorded by the CDF detector during the 1992-1993 Tevatron collider run. The asymmetry is sensitive to the slope of the proton's d/u quark distribution ratio down to x less than 0.01 at Q(exp 2) approximately M(sub w)(exp 2), where nonperturbative QCD effects are minimal. Of recent parton distribution functions, those of Martin, Roberts, and Stirling are favored over those of the CTEQ collaboration. This difference is seen even though both sets agree, at the level of the nuclear shadowing corrections, with the recent NMC measurements of F(sub 2)(sup mu n)/F(sub 2)(sup mu p). DOE

MEASUREMENT OF THE AVERAGE LIFETIME OF B HADRONS AT SLD
Greg Punkar Sep. 1994 4 p Presented at the Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM, 2-6 Aug. 1994
(Contracts DE-FG02-91ER-40676; DE-FG03-92ER-40701; DE-FG03-91ER-40618; DE-FG03-92ER-40689; DE-FG03-93ER-40788; DE-FG02-91ER-40672; DE-FG02-91ER-40677; DE-AC03-76SF-00098; DE-FG02-92ER-40715; DE-AC02-76ER-03069)
(DE95-002121; SU-SLAC-PUB-6595; CONF-940816-37) Avail: CASI HC A01/MF A01

The authors present preliminary measurements of the average B hadron lifetime using a sample of 50,000 Z(sup 0) events collected by SLD at the SLC in 1993. Their first technique uses the impact parameter of tracks in jets opposite tagged b jets. They obtain (tau)(sub B)(Sigma (delta)) = 1.617 (+/-) 0.048 (+/-) 0.086 ps, and (tau)(sub B)((Sigma)(delta)) = 1.627 (+/-) 0.054 (+/-) 0.132ps from single and summed impact parameter distributions. The second technique uses inclusive vertices reconstructed in three dimensions. From the decay length distribution, they extract (tau)(sub B) = 1.577 (+/-) 0.032 (+/-) 0.046 ps. DOE

MICROSCOPIC THEORY OF NORMAL LIQUID He-3
N. Nafari and A. Doroudi (Atomic Energy Organization of Iran, Teheran.) Mar. 1994 21 p
(DE94-629047; IC-94/43) Avail: CASI HC A03/MF A01 (US Sales Only)

We have used the self-consistent scheme proposed by Singwi, Tosi, Land and Sjoelander (STLS) to study the properties of normal liquid He-3. By employing the Aziz potential (HFD-B) and some other realistic pairwise interactions, we have calculated the static structure factor, the pair-correlation function, the zero sound frequencies as a function of wave-vector, and the Landau parameter F(sup s)(sub 0) for different densities. Our results show considerable improvement over the Ng-Singwi's model potential of a hard core plus an attractive tail. Agreement between our results and the experimental data for the static structure factor and the zero sound frequencies is fairly good. DOE

THE DYNAMIC STRUCTURE FUNCTION OF BOSE LIQUIDS IN THE DEEP INELASTIC REGIME
A. Belic Nov. 1993 9 p
(DE94-629077; IC-93/395) Avail: CASI HC A02/MF A01 (US Sales Only)

We study the dynamic structure function S(k, (omega)) of Bose liquids in the asymptotic limit k, omega approaches infinity at constant y equivalent to m/k (omega - k(exp 2)/2m), using orthogonal correlated basis of Feynman phonon states. DOE

N95-22188# Brookhaven National Lab., Upton, NY.
INTERFERENCE OF FLUORESCENCE X RAYS AND COHERENT EXCITATION OF CORE LEVELS
Y. Ma (Washington Univ., Seattle, WA.) and M. Blume 1994 8 p Presented at the International Meeting on Synchrotron Radiation Instrumentation, Stony Brook, NY, 18-22 Jul. 1994
(Contract DE-AC02-76CH-00016)
(DE94-016809; BNL-60676; CONF-940714-5) Avail: CASI HC A02/MF A01

The question of coherence in inelastic x-ray absorption and fluorescence processes among identical interacting atoms is studied using a simple diatomic model. Conditions for the coherence are discussed in terms of energy scales, such as the core hole life-time, instrument energy resolutions, and the splitting of the electronic levels. As in the classical Young double-slit experiment, the primary requirement is that it be impossible to determine which atom has undergone the excitation-decay process. DOE

THERMAL AND DEFORMATION ANALYSES OF A NOVEL CRYOGENICALLY COOLED MONOCHROMATOR FOR AN ADVANCED PHOTON SOURCE BEAMLINE
Zhibi Wang, Wenbing Yun, T. M. Kuzay, and G. Knapp 1994 11 p Presented at the International Meeting on Synchrotron Radiation Instrumentation, Stony Brook, NY, 18-22 Jul. 1994
(Contract W-31-109-eng-38)
(DE94-016914; ANL/XFD/CP-82931; CONF-940714-6) Avail: CASI HC A03/MF A01

The analytical results and design considerations for a novel cryogenically cooled Advanced Photon Source (APS) monochromator are presented. Because the monochromator uses silicon crystal, cryogenic cooling enables one to take advantage of the high conductivity and low thermal expansion coefficient of silicon at cryogenic temperatures. The APS monochromator features a machined slot with variable thickness below the surface. With this configuration, only a fraction of the total undulator power is absorbed by the crystal; the remaining power is transmitted through the crystal and is absorbed by a second element that can be cooled by standard cooling techniques. A variety of analyses have been performed with different parameters and configurations to maximize the performance of the monochromator and minimize the total absorbed power by the crystal. DOE

N95-22194# Fermi National Accelerator Lab., Batavia, IL.
ELECTROWEAK BOSON PAIR PRODUCTION IN p(-p) COLLISIONS AT THE SQUARE ROOT OF s = 1.8 TeV
T. A. Fuess (Argonne National Lab., IL.) 16 Sep. 1994 6 p Presented at the Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM, 2-6 Aug. 1994
(Contract DE-AC02-76CH-03000)
(DE95-000725; FNAL/C-94/283-E; CONF-940816-28) Avail: CASI HC A02/MF A01

Results from CDF on W(+)W(-), WZ, and W gamma production in square root of s = 1.8 TeV (bar p)-p collisions from the 1992-1993 collider run are presented. Direct limits on WW gamma and WWZ anomalous couplings are obtained. DOE

N95-22196# Fermi National Accelerator Lab., Batavia, IL.
INCLUSIVE B PRODUCTION AT CDF AND D0
K. A. Bazizi Sep. 1994 14 p Presented at the 29th Moriond Meeting on Quantum Chromodynamics and High Energy Hadronic Interactions, Les Arcs, France, 12-26 Mar. 1994
(Contract DE-AC02-76CH-03000)
(DE95-000728; FNAL/C-94/300-E; CONF-940327-11) Avail: CASI HC A03/MF A01

We present the latest results on inclusive b production studies from CDF and D0 collaborations in p(bar p) collisions at square root of s = 1.8 TeV at the Fermilab Tevatron Collider. The results are from recently completed analyses of 1988-1989 data and preliminary analyses of 1992-1993 data. This report includes new b cross section measurements using semileptonic b decays to muons, J/psi production in dimuon events, and a study of b(bar b) correlations in e mu events. The new results from CDF and D0 show no major discrepancies between the Tevatron data and the NLO QCD prediction for p(sub t) values down to 6 GeV. DOE

N95-22197# Fermi National Accelerator Lab., Batavia, IL.
SEARCH FOR SQUARKS AND GLUINOS IN D0
D. R. Claes (State Univ. of New York, Stony Brook, NY.) Sep. 1994 5 p Presented at the Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM, 2-6 Aug. 1994
(Contracts DE-AC02-76CH-03000; DE-FG02-92ER-40697)
(DE95-000730; FNAL/C-94/290-E; CONF-940816-30) Avail: CASI HC A01/MF A01

Based on 7.1 pb(exp -1) of single interaction event data collected by the DO Detector at Fermilab during the 1992-1993 p(bar p) collider run at square root of s = 1.8 TeV, results are presented of a search for supersymmetric partners of the quark and gluon, the squark and gluino, using missing E(sub T) and jets as the signature. Limits are set on the squark and gluino masses in the context of the Minimal Supersymmetric Standard Model including the effect of cascade decays of the squark and gluino. DOE

UNIVERSAL SPECTRAL CORRELATIONS AT THE MOBILITY EDGE
V. E. Kravtsov, A. G. Aronov, I. V. Lerner (Birmingham Univ., England.), and B. L. Altshuler (Massachusetts Inst. of Tech., Cambridge, MA.) Sep. 1993 13 p
(DE94-629031; IC-93/330) Avail: CASI HC A03/MF A01 (US Sales Only)

The two-point spectral correlation function for a quantum particle in a random potential is calculated in the vicinity of the Anderson transition in d greater than 2 dimensions. Based on this, the variance of the number of states N in a given energy interval with /N/ much greater than 1 (/.../ means the ensemble average) is shown to have a universal behavior, /(N - /N/)(exp 2)/ approximately /N/(exp 2/d), different from that in both metallic and insulator regime. This is much smaller than a naive dimensional estimation would give. The suppression of fluctuations N is due to nontrivial cancellations resulting from the causality and scaling requirements. These cancellations are necessary for the spectral correlation function to satisfy an exact sum rule resulting from the conservation of the total number of states. DOE

AN ANALYTICAL ELECTRON DISTRIBUTION FUNCTION FOR INELASTIC COLLISIONS IN A UNIFORM GAS WITH TIME VARYING ELECTRIC FIELD
M. Garcia 21 Jul. 1994 24 p
(Contract W-7405-eng-48)
(DE95-003476; UCRL-ID-117952) Avail: CASI HC A03/MF A01

The desire for improved control over electric discharge phenomena in a wide variety of scientific, technological, manufacturing, and waste processing activities spurs the development of non-equilibrium, non-uniform, and time dependent models. This paper addresses the situation of slightly ionized, spatially uniform gas with a time varying electric field, and in which inelastic collisions occur. The purpose here is to present a reasonably consistent, and reasonably accessible analytical result for the electron kinetics in a gas discharge regime of technological interest. This paper will be structured as follows. First, the analytical result for the time dependent electron distribution function is stated. Second, a summary of the solution procedure with its attendant assumptions is given. Lastly, examples of the solution are given for an idealized nitrogen-like gas where the electric field ramps between static conditions, and then for sinusoidal behavior. DOE

N95-22223# Lawrence Livermore National Lab., Livermore, CA.
AN ANALYTICAL, INELASTIC, SPACE AND TIME DEPENDENT ELECTRON DISTRIBUTION FOR ELECTRICALLY EXCITED GASES
M. Garcia 2 Sep. 1994 30 p
(Contract W-7405-eng-48)
(DE95-003478; UCRL-ID-118498) Avail: CASI HC A03/MF A01

An approximate, electron energy distribution function, f((var epsilon), x, t), is obtained for the case of a slightly ionized gas with inelastic electron-molecule collisions, and for an external electric field with both spatial and temporal variation. A previous analysis of the Boltzmann equation, for a slightly ionized gas with time-varying electric field and inelastic collisions, has been extended to include the effect of a spatial gradient in the electric field. This paper describes the spatial variation effect by continuing the discussion on the electron distribution initiated in that previous report. An interesting feature of this analytical distribution function is its explicit dependence on both the magnitude of the field and its gradients. An example is included of the combined effect of field variations in space and time upon the local average electron energy in an idealized N2-like gas. DOE

CONSTRAINTS ON THE LEFT-RIGHT SYMMETRIC MODEL FROM b YIELDS s GAMMA
T. G. Rizzo Nov. 1994 7 p Presented at the 1994 International Workshop on B Physics, Physics Beyond the Standard Model at the B Factory, Nagoya, Japan, 26-28 Oct. 1994
(Contract DE-AC03-76SF-00515)
(DE95-003469; SU-SLAC-PUB-6719; CONF-9410248-1) Avail: CASI HC A02/MF A01

The recent observation by the CLEO Collaboration of the inclusive decay b yields s gamma with a branching fraction consistent with the expectations of the Standard Model is used to constrain the parameter space of the Left-Right Symmetric Model. Two scenarios are considered: (1) equal left- and right-handed Cabibbo-Kobayashi-Maskawa mixing matrices, V(sub L) = V(sub R)(or V(sub R)*); and (2) the Gronau-Wakaizumi model wherein B-decays proceed only via right-handed currents and V(sub L) and V(sub R) are quite distinct. In the later case the bounds from b yields s gamma are combined with other constraints leaving a parameter range that is very highly restricted and which implies that this model may soon be completely ruled out by improving data. DOE

HELIUM PRODUCTION BY 10 MeV NEUTRONS IN IRON, NICKEL AND COPPER
R. C. Haight, D. W. Kneff (Rockwell International Corp., Canoga Park, CA.), B. M. Oliver (Rockwell International Corp., Canoga Park, CA.), L. R. Greenwood (Pacific Northwest Lab., Richland, WA.), and H. Vonach (Wien Univ., Austria.) 1994 7 p Presented at the International Conference on Nuclear Data for Science and Technology: Nuclear Data for the Twenty-first Century, Gatlinburg, TN, 9-13 May 1994
(Contract W-7405-eng-36)
(DE94-014798; LA-UR-94-1593; CONF-940507-28) Avail: CASI HC A02/MF A01

Helium production cross sections for the elements Fe, Ni, and Cu and for the isotopes (56)Fe, (58)Ni and (60)Ni have been measured for 10-MeV neutrons. Samples were irradiated with an intense neutron source from the (1)H(t,n) reaction using a rotating gas cell. The generated helium was determined by isotope dilution gas mass spectrometry. Induced radioactivities and known cross sections were used together with calculations based on the source reaction to deduce the neutron fluence at each sample position. The results are in fair agreement with literature values for (n, alpha) cross sections measured by alpha-particle detection and integrated over the alpha-particle energies and angular distributions. RADIO-FREQUENCY TECHNIQUES AT THE ISIS PULSED MUON SOURCE
S. P. Cottrell, B. Hitti, and C. A. Scott Sep. 1994 15 p Prepared in cooperation with Science Research Council, Daresbury, England
(PB95-129854; RAL-94-101) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

This report describes experiments performed at the ISIS pulsed muon facility with a view to the future development of an RF MuSR facility. After a brief introduction to the principles of the magnetic resonance experiment, the design of the high-power pulsed RF equipment is discussed. Because the longitudinal field strength was limited to approximately 140 G, with the corresponding resonance frequency for muon plus below the base frequency of our power amplifier, studies were restricted to muonium systems with results being presented both for quartz and boron nitride. Finally, both the RF field strength and homogeneity are evaluated using time differential data taken at resonance in the rotating frame. NTIS

A NEW PARALLEL METHOD FOR MOLECULAR DYNAMICS SIMULATION OF MACROMOLECULAR SYSTEMS
S. Plimpton and B. Hendrickson Aug. 1994 22 p
(Contract DE-AC04-94AL-85000)
(DE94-018621; SAND-94-1862) Avail: CASI HC A03/MF A01

Short-range molecular dynamics simulations of molecular systems are commonly parallelized by replicated-data methods, where each processor stores a copy of all atom positions. This enables computation of bonded 2-, 3-, and 4-body forces within the molecular topology to be partitioned among processors straightforwardly. A drawback to such methods is that the inter-processor communication scales as N, the number of atoms, independent of P, the number of processors. Thus, their parallel efficiency falls off rapidly when large numbers of processors are used. In this paper a new parallel method called force-decomposition for simulating macromolecular or small-molecule systems is presented. Its memory and communication costs scale as N/(radical)P, allowing larger problems to be run faster on greater numbers of processors. Like replicated-data techniques, and in contrast to spatial-decomposition approaches, the new method can be simply load-balanced and performs well even for irregular simulation geometries. The implementation of the algorithm in a prototypical macromolecular simulation code ParBond is also discussed. On a 1024-processor Intel Paragon, ParBond runs a standard benchmark simulation of solvated myoglobin with a parallel efficiency of 61% and at 40 times the speed of a vectorized version of CHARMM running on a single Cray Y-MP processor. EXPERIMENTAL STUDY OF INTERACTIONS OF HIGHLY CHARGED IONS WITH ATOMS AT keV ENERGIES Progress Report, 16 Apr. - 1 Aug. 1994
V. O. Kostroun 3 Aug. 1994 9 p
(Contract DE-FG02-86ER-13519)
(DE94-018648; DOE/ER-13519/9) Avail: CASI HC A02/MF A01

The objective of this program is the experimental study of interactions of low energy, highly charged ions with other atomic species. The Cornell superconducting solenoid, cryogenic electron beam ion source CEBIS designed and built in our laboratory is the major piece of apparatus used in these investigations. This progress report describes the work accomplished during the period April 16, 1994 and August 1, 1994. This includes both finished experiments and preparatory work for planned future experiments using the source. During this time, we have completed measurements of the angular distributions and energy gains in Ar(q+) (11 less than or equal to q less than or equal to 14) on Ar collisions at 72 qeV laboratory energy. In particular, energy gain spectra at different laboratory scattering angles were obtained for Ar(q-1)(+) projectiles, i.e. projectiles whose final charge state had decreased by one unit. The experimental technique used, and the method of analysis are described elsewhere. The raw spectra are similar to those observed for Ar(8+) and Ar(I0+) on Ar at comparable energies, as well as those described in the last progress report for Ar(I2+) on Ar. DOE

NEUTRON COMPTON SCATTERING
J. Mayers Jul. 1994 16 p See also PB93-225993
(PB95-130290; RAL-94-078) Avail: Issuing Activity (National Technical Information Service (NTIS))

The possibility of measuring atomic momentum distributions in condensed matter systems by neutron scattering is analagous to the measurement of electron momentum distributions by Compton scattering and measurement of nucleon momenta by deep inelastic scattering, and is known as neutron Compton scattering (NCS) or deep inelastic neutron scattering. The electron volt spectrometer at ISIS has been dedicated to the development of the NCS technique during the last five years and now has a full user program which is demonstrating the potential of this new neutron scattering technique for providing unique and detailed information about the atomic wavefunction and atomic kinetic energies in condensed matter. NCS has applications to all areas of neutron science e.g. quantum fluids, molecular science, liquid metals, amorphous and noncrystalline materials, hydrogen bonds, atomic and molecular hydrogen in materials, and many other areas. We discuss the type of information which can be obtained from NCS measurements and give a number of examples of such measurements. NTIS

Fermilab E769, a fixed-target experiment conducted during the 1987-88 running period, yielded large numbers of charm particles. Through collisions of 250 GeV (pi)(sup (+-)), K(sup (+-)), and p on a multifoil target, E769 allows for studies of beam flavor dependence in the hadroproduction of charm. Through the decay modes D(sup +) (yields) K(sup (minus))(pi)(sup +)(pi)(sup +), D(sub s)(sup +) (yields) (phi)(pi)(sup +), and D(sub s)(sup +) (yields) (anti K)(sup *0) K(sup +) (and charge conjugates), the authors have extracted D(sup (+-)) and D(sub s)(sup (+-)) signals for all five beam types. They report preliminary measurements of the beam dependence of the absolute production cross-sections (For Feynman x greater than 0) of the D(sup (+-)) and D(sub s)(sup (+-)). DOE

PROTON AND PRODUCED PARTICLE DISTRIBUTIONS FROM Au+Au COLLISIONS AT 11.6 A GeV/c
B. Moskowitz 1994 6 p Presented at the Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM, 2-6 Aug. 1994
(Contract DE-AC02-76CH-00016)
(DE94-018634; BNL-60732; CONF-940816-4) Avail: CASI HC A02/MF A01

The highest net baryon density possible in the laboratory - up to ten times normal nuclear density - is expected in the central region of collisions of heavy nuclei (A approx. 200) at energies near 10 GeV per nucleon. The transverse energy (E(sub T)) distribution, as well as yields of identified particles ((pi)(sup +), K(sup +) and protons), from Au-197 + Au-197 at 11.64A GeV/c are presented. Two key observations are a large degree of proton 'stopping,' indicating multiple scatterings of the incident nucleons, and a proportional relationship of the pion production to the number of participating nucleons. Strangeness enhancement, a proposed signature of the quark-gluon plasma, is studied via the K(sup +)/(pi)(sup +) ratio, which achieves the value of 21% without a strong centrality dependence. Comparisons to similar data taken with a 14.6A GeV/c beam of Si-28 are made. DOE

PARITY VIOLATION IN THE COMPOUND NUCLEUS
J. D. Bowman, C. M. Frankle, and A. A. Green 1994 15 p Presented at the Intersections of Particle and Nuclear Physics; Symmetries in Subatomic Physics, St. Petersburg, FL; Taiwan (China), 31 May - 6 Jun. 1994; 16-18 May 1994
(Contract W-7405-eng-36)
(DE95-002742; LA-UR-94-3563; CONF-940514-16; CONF-9405249-1)
Avail: CASI HC A03/MF A01

The status of parity violation in the compound nucleus is reviewed. The results of previous experimental results obtained by scattering polarized epithermal neutrons from heavy nuclei in the 3-p and 4-p p-wave strength function peaks are presented. Experimental techniques are presented. The extraction of the mean squared matrix element of the parity-violating interaction, M(exp 2), between compound-nuclear levels and the relationship of M(exp 2) to the coupling strengths in the meson exchange weak nucleon-nucleon potential are discussed. The tendency of measured asymmetries to have a common sign and theoretical implications are discussed. New experimental results are presented that show that the common sign phenomenon is not universal, as theoretical models developed up to now would predict. DOE

RESONANT CHARGE TRANSFER IN HYPERTHERMAL ATOMIC AND MOLECULAR ION-SURFACE COLLISIONS Final Report, 1 Jan. 1991 - 30 Jun. 1994
Barbara H. Cooper 23 Aug. 1994 35 p
(Grant AF-AFOSR-0137-91)
(AD-A284937; AFOSR-94-0561TR) Avail: CASI HC A03/MF A01

We have investigated the interactions of hyperthermal (few to several hundred eV) atomic ions with metal surfaces, in particular the dynamics of electron transfer between the particle and surface. Progress is reported in the following areas: (1) construction of a time-of-flight spectrometer for measuring energy- and angle-resolved distributions of neutral and charged alkali atoms; (2) measurements of the magnitude and velocity-dependence of the neutralization probabilities for Li, Na, and K scattered from clean Cu(001); dramatic differences for Li, Na, and K reflect the sensitivity of nonadiabatic charge transfer to the energies and lifetimes of atomic electronic states near the surface; (3) measurements of branching ratios for Li(+), Li(-) and ground- and excited state (Li(2s) and Li(2p)) formation in Li(+) scattering from alkali-covered Cu(001), which provide a test of new multi-state charge transfer models and indicate some of the first evidence of multi-state effects in atom-surface charge transfer; (4) extensions of our multi-state studies to include formation of higher energy excited states of Li and Na, and multiple states in O(+) and O(+2) scattering; (5) observation of trajectory-dependent charge transfer for 50 eV Na(+) scattering from clean Cu(001); evidence is found for modification of the neutralization due to collision-induced defect formation in the surface; (6) preliminary measurements of trapping probabilities for 10-100 eV Na(+) scattering from clean Cu(001), which show a strong nonmonotonic dependence on the incident energy. These studies are part of a new program to investigate the mechanisms by which hyperthermal energy ion beams can be used to modify thin film growth. DTIC

MODELING THE DYNAMICS OF CHARGED-PARTICLE BEAMS USING A FOKKER-PLANCK APPROACH
C. L. Bohn and J. R. Delayen 1994 3 p Presented at the 17th International LINAC Conference, Tsukuba, Japan, 21-26 Aug. 1994
(Contract W-31-109-eng-38)
(DE95-001458; ANL/TD/CP-84288; CONF-9408125-37) Avail: CASI HC A01/MF A01

At the previous Linac Conference, we introduced a semianalytic Fokker-Planck formalism for calculating the evolution of intense, nonrelativistic, mismatched beams propagating through focusing channels. We have since elaborated on its physical basis and greatly expanded its applicability. In this paper, we implement the model to study the dynamics of a circularly symmetric beam propagating through a linear focusing channel. An example is discussed for an ion beam and accelerator parameters which are representative of high-current spallation neutron sources in which space-charge forces are important. The example illustrates the dynamics of emittance growth and halo formation in the beam. DOE

X-RAY IMAGING OF UNIFORM LARGE SCALE-LENGTH PLASMAS CREATED FROM GAS-FILLED TARGETS ON NOVA
D. H. Kalantar, B. J. MacGowan, T. P. Bernat, D. E. Klem, D. S. Montgomery, J. D. Moody, D. H. Munro, G. F. Stone, W. W. Hsing (Los Alamos National Lab., NM.), and B. H. Failor (Physics International Corp., Berkeley, CA.) May 1994 15 p Presented at the 10th Topical Conference on High-Temperature Plasma Diagnostics, Rochester, NY, 8-12 May 1994
(Contract W-7405-eng-48)
(DE94-018339; UCRL-JC-116195; CONF-940552-31) Avail: CASI HC A03/MF A01

We report on the production and characterization of large scale-length plasmas created by illuminating gas-filled thin-walled balloon-like targets using the Nova laser. The targets consisted of a 4-5 000 (angstrom) skin surrounding 1 atm of neopentane which when ionized becomes a plasma with 10(sup 21) electrons/cu cm. Results are presented from x ray imaging used to evaluate the uniformity of the plasma. The most uniform plasmas were produced by illuminating the target with large converging beams that overlapped to cover most of the surface of the gasbag. An alternate focus geometry using small beam spots resulted in a less uniform plasma with low density holes in it. DOE

A NEW TOOL FOR ACCELERATOR SYSTEM MODELING AND ANALYSIS
George H. Gillespie (Gillespie, George H. Associates, Inc., Del Mar, CA.), Barry W. Hill (Gillespie, George H. Associates, Inc., Del Mar, CA.), and Robert A. Jameson 1994 5 p Presented at the 17th International LINAC Conference, Tsukuba, Japan, 21-26 Aug. 1994
(Contract W-7405-eng-36)
(DE94-018292; LA-UR-94-2804; CONF-9408125-22) Avail: CASI HC A01/MF A01

A novel computer code is being developed to generate system level designs of radiofrequency ion accelerators. The goal of the Accelerator System Model (ASM) code is to create a modeling and analysis tool that is easy to use, automates many of the initial design calculations, supports trade studies used in assessing alternate designs and yet is flexible enough to incorporate new technology concepts as they emerge. Hardware engineering parameters and beam dynamics are modeled at comparable levels of fidelity. Existing scaling models of accelerator subsystems were used to produce a prototype of ASM (version 1.0) working within the Shell for Particle Accelerator Related Codes (SPARC) graphical user interface. A small user group has been testing and evaluating the prototype for about a year. Several enhancements and improvements are now being developed. The current version (1.1) of ASM is briefly described and an example of the modeling and analysis capabilities is illustrated. DOE

EFFECT OF SPACE CHARGE TUNE SHIFT ON TRANSVERSE INSTABILITIES
M. Blaskiewicz and W. T. Weng 1994 3 p Presented at the 4th European Particle Accelerator Conference, London, England, 27 Jun. - 1 Jul. 1994
(Contract DE-AC02-76CH-00016)

(DE94-016790; BNL-49820; CONF-940618-42) Avail: CASI HC A01/MF A01

Transverse instabilities in synchrotrons with large space charge tune shift are considered. In particular the variation of the incoherent tune with longitudinal position in the bunch is included. Expansion in an appropriate basis set results in an eigenvalue problem which reduces to previously derived expressions when the space charge tune spread is ignored. The regime where the synchrotron tune is negligible compared to the space charge tune shift is also considered. Under appropriate conditions this results in a significantly smaller growth rate than the ones obtained using the weak coupling formalism. Finally, the effect of octupole induced betatron tune spread is included, resulting in a technique for estimating the maximum stable current. DOE

STUDIES OF LONGITUDINAL INSTABILITY WITH AN ELECTRON BEAM

1994 13 p
(Contract DE-FG02-92ER-54178)
(DE94-018646; DOE/ER-54178/4) Avail: CASI HC A03/MF A01

This progress report covers the research on the 'Study of Longitudinal Instability with an Electron Beam' performed at the University of Maryland during the period from September 1, 1993 to February 28, 1994 of the two-year grant sponsored by the Department of Energy, under Grant No. DEFG02-92ER54178. This research is motivated by the issue of longitudinal instability in induction linacs as drivers for heavy ion inertial fusion. The Fusion Policy Advisory Committee (FPAC) in its final report to DOE (September 1990) identified longitudinal instability as a key physics problem that needs to be solved if an induction linac is to be developed into a successful HIF driver. The FPAC report also stated that 'in parallel' to the design and construction of ILSE 'enhanced theoretical and experimental efforts are required for an improved understanding of potentially serious longitudinal beam instability issues'. The experiment with electron beams in this area is a low-cost way to gain a thorough understanding of the instability and to test computer codes in collaboration with LBL, LLNL, and I. Haber at NRL. The last six months saw the transition of the research activities from phase 1 to phase 2. By the end of last September, the experiments on space-charge waves had been completed. This had fulfilled the first year's goal of this two-year grant. Though the completion of the experiments was one month later than that scheduled and the data analysis still continues up to now, the authors have done much more than was originally proposed. DOE

HIGH ENERGY PHOTON-PHOTON COLLISIONS

S. J. Brodsky and P. M. Zerwas (Deutsches Elektronen-Synchrotron, Hamburg, Germany.) Jul. 1994 45 p Presented at the Workshop on Gamma-Gamma Colliders, Berkeley, CA, 28-31 Mar. 1994
(Contract DE-AC03-76SF-00515)
(DE94-017494; SU-SLAC-PUB-6571; CONF-940351-1) Avail: CASI HC A03/MF A01

The collisions of high energy photons produced at a electron-positron collider provide a comprehensive laboratory for testing QCD, electroweak interactions and extensions of the standard model. The luminosity and energy of the colliding photons produced by back-scattering laser beams is expected to be comparable to that of the primary e(sup +)e(sup -) collisions. In this overview, we shall focus on tests of electroweak theory in photon-photon annihilation, particularly gamma(gamma) yields W(sup +)W(sup -), gamma(gamma) yields Higgs bosons, and higher-order loop processes, such as gamma(gamma) yields gamma(gamma), Z(gamma) and ZZ. Since each photon can be resolved into a W(sup +)W(sup -) pair, high energy photon-photon collisions can also provide a remarkably background-free laboratory for studying WW collisions and annihilation. We also review high energy gamma(gamma) tests of quantum chromodynamics, such as the scaling of the photon structure function, t(bar t) production, mini-jet processes, and diffractive reactions. DOE

DERIVATION OF COUPLING IMPEDANCE FROM THE WAKE POTENTIAL OF A FINITE BUNCH

King-Yuen Ng Sep. 1994 3 p
(Contract DE-AC02-76CH-03000)
(DE95-002529; FNAL-TM-94/1903) Avail: CASI HC A01/MF A01

The coupling impedance of the vacuum chamber can be obtained from the wake potential left by a bunch of finite extent. Oftentimes, however, the impedance so obtained violates the condition that its real part must be everywhere non-negative. The proper treatment is derived and discussed. DOE

N95-20494# California Univ., Berkeley. Lawrence Berkeley Lab, CA.

SIX-DIMENSIONAL MODELING OF COHERENT BUNCH INSTABILITIES AND RELATED FEEDBACK SYSTEMS IN STORAGE RINGS WITH POWER-SERIES MAPS FOR THE LATTICE

J. Bengtsson, D. Briggs (Stanford Univ., CA.), and M. Meddahi (European Organization for Nuclear Research, Geneva, Switzerland.) Jun. 1994 3 p Presented at the 4th European Particle Accelerator Conference, London, England, 27 Jun. - 1 Jul. 1994
(Contract DE-AC03-76SF-00098)
(DE94-017965; LBL-35956; CONF-940618-64) Avail: CASI HC A01/MF A01

The authors have developed 6-dimensional phase-space code that tracks macroparticles for the study of coherent bunch instabilities and related feedback systems. The model is based on power-series maps to represent the lattice, and allows for straightforward inclusion of effects such as amplitude dependent tune shift, chromaticity, synchrotron oscillations, and synchrotron radiation. It simulates long range wake fields such as resistive-wall effects as well as the higher order modes in cavities. The model has served to study the dynamics relevant to the transverse feedback system currently being commissioned for the Advanced Light Source (ALS). Current work integrates earlier versions into a modular system that includes models for transverse and longitudinal feedback systems. It is designed to provide a modular approach to the dynamics and diagnostics, allowing a user to modify the model of a storage ring at run-time without recompilation. DOE

MODELING OF BEAM DYNAMICS AND COMPARISON WITH MEASUREMENTS FOR THE ADVANCED LIGHT SOURCE (ALS)

J. Bengtsson and M. Meddahi (European Organization for Nuclear Research, Geneva, Switzerland.) Jun. 1994 3 p Presented at the 4th European Particle Accelerator Conference, London, England, 27 Jun. - 1 Jul. 1994
(Contract DE-AC03-76SF-00098)

(DE94-017970; LBL-35959; CONF-940618-65) Avail: CASI HC A01/MF A01

The data collected during the April 1993 ALS commissioning period includes the measured closed orbit as a function of either dipole corrector strength or RF frequency, in addition to turn by turn data for the betatron motion as a function of RF frequency. The sensitivity matrix and dispersion function are extracted from this data by taking differences between orbits, whereas lattice functions and chromaticity are obtained using Fourier analysis and interpolation techniques. Lattice functions are also derived from the sensitivity matrix using a nonlinear least squares fit. The results are then compared with numerical simulations and analytical formulas derived using maps and a Lie product normal form approach. The Lie method is preferred to traditional Hamiltonian perturbation theory because it is easily generalized to the nonlinear case and also leads to a significantly reduced amount of algebra. The computer modeling uses state of the art single particle beam dynamics tools including: Tracy-2, DA-pascal, DA-Library and Lie-Lib. In particular, DA-Pascal allows for a straightforward implementation of a Krakpot style code, based on the 'exact' single particle local Hamiltonian and a symplectic integrator, necessary for correct modeling of the nonlinear chromaticity. PHOTOELECTRONS BEAM MEASUREMENT FROM A MAGNESIUM CATHODE IN A RF ELECTRON GUN
X. J. Wang, T. Srinivasan-Rao, K. Batchelor, I. Ben-Zvi, and J. Fischer 1994 3 p Presented at the 16th International Free Electron Laser Conference, Stanford, CA, 21-26 Aug. 1994
(Contract DE-AC02-76CH-00016)
(DE94-017994; BNL-60738; CONF-9408146-1) Avail: CASI HC A01/MF A01

The performance of a magnesium cathode in a one-and-half cell photocathode RF gun measured at the Brookhaven Accelerator Test Facility (ATF). The frequency quadrupled Nd:YAG laser (266 nm) was used to stimulate the photoelectron emissions. For a normal incident laser pulse, the quantum efficiency of the magnesium at 10(exp -7) torr was measured to be 5 x 10(exp -4), which is more than 20 times the value for copper under similar conditions. PRS SCOPING STUDY 1: SCALING LAW ESTIMATES FOR K-SHELL RADIATION YIELDS ON JUPITER-CLASS GENERATORS
J. L. Giuliani, Jr., J. Davis, M. Mulbrandon, K. Whitney, and J. W. Thornhill 31 May 1994 68 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A279716; NRL/MR/6720-94-7466) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The radiation output from krypton, argon, and xenon z-pinch loads is calculated for JUPITER-class generators using an amended version of the Whitney, et al., K-shell yield scaling law. The present version, termed J-scaling law, is directed toward JUPITER predictions and includes a dependence on the final radius as well as a smooth yield fall off for weak implosions. When combined with a circuit model and a thin shell model for the plasma pinch dynamics, comparisons and predictions of yields can be made for specific machines. Comparisons with existing aluminum data on DOUBLE EAGLE and SATURN demonstrate the veracity of the J-scaling law. A simple equivalent circuit with variable driving voltage is used to predict the trend of K-shell yield with increasing load current. In general, for JUPITER-class machines (30 - 100 MA)Ar is in the efficient I squared scaling regime, xenon is in the weak I to the 4th power regime, and Kr is a transition radiator. Candidate transmission line circuits for the Linear Inductive Adder (LIA) and the modular Inductive Energy Store (IES) JUPITER designs are investigated in detail. Load currents, voltages, and coupled kinetic energies are calculated as a function of (MR (sub 0))(exp 2). These calculations are then combined with the J-scaling law to predict K-shell yields for the transmission line circuits. Variations of the standard candidate point are also investigated: specifically, the effects of a larger front end inductance, of eliminating a closing switch in the LIA, and of increasing the conduction time on the IES. CRYSTALLINE BEAMS: THE HORIZONTAL ZIGZAG
A. F. Haffmans, D. Maletic, and A. G. Ruggiero May 1994 17 p
(Contract DE-AC02-76CH-00016)
(DE95-002227; BNL-60876) Avail: CASI HC A03/MF A01

The authors continue their investigation of 'Crystalline Beams' in the ground state. In this paper they study the possibility of storing an intense beam of charged particles in a storage ring where the particles acquire a horizontal zigzag configuration. They define the equilibrium configuration, and examine the confinement and stability conditions. The problem of 'shear' between particles circulating side by side caused by the curvature of the trajectories is examined and solved. DOE

RADIATION-DRIVEN TARGETS FOR HEAVY-ION FUSION
D. D. M. Ho, J. A. Harte, and M. Tabak Aug. 1994 13 p Presented at the 15th International Conference on plasma Physics and Controlled Nuclear Fusion Research, Seville, Spain, 26 Sep. - 1 Oct. 1994
(Contract W-7405-eng-48)
(DE95-002264; UCRL-JC-118161; CONF-940933-12) Avail: CASI HC A03/MF A01

The baseline hohlraum configuration for heavy-ion fusion has the radiation converters placed at opposite ends. For a capsule that absorbs about 1 MJ and has an initial radius of 0.234 cm, the minimum initial capsule to hohlraum surface area ratio that can provide an adequate time-dependent symmetry requirement for a capsule implosion is about 0.075, based on calculations using the view factor code GERTIE. The capsule implosion is calculated using the hydrodynamic code HYADES. The energy coupling efficiency between the hohlraum and the capsule is 21%; the peak hohlraum temperature is 260 eV, and the gain of this target system can be as high as 80. By placing the converters outside the hohlraum, the radii of the converters can be varied according to the beam focusing requirements while the hohlraum dimensions remain unchanged. By bending the radiation converters by 90 degrees, one can obtain a hohlraum configuration that requires the ion beams to come in from only one direction. DOE

OPTIMIZING THE LENGTH OF THE STORES AND RELATED EFFECTS
E. McCrory Oct. 1994 10 p
(Contract DE-AC02-76CH-03000)
(DE95-002531; FNAL-TM-1878) Avail: CASI HC A02/MF A01

This memo is an attempt to create an accurate analytical model for the luminosity obtained in the Fermilab Tevatron during collider operation. Other people, in particular Alan Hahn and, alledgedly, Vinod Bharadwaj and Gerry Dugan, have addressed this topic and predicted an optimum store duration. The approach taken here is slightly different from Hahn's, in particular, analytic forms for the model are written down and the optima are found directly, through differentiation. Also, specifying the parameters clearly is helpful in understanding the dependencies of this phenomenology. First, the optimum store duration is derived from first principles, and then graphs of this are made and various assumptions on the parameters are analyzed. Finally, some related effects are discussed. DOE

CONFINEMENT AND STABILITY OF CRYSTALLINE BEAMS IN STORAGE RINGS
A. F. Haffmans 1994 17 p Presented at the Advanced Accelerator Concepts Workshop, Lake Geneva, WI, 13-18 Jun. 1994
(Contract DE-AC02-76CH-00016)
(DE95-002515; BNL-60878; CONF-940681-3) Avail: CASI HC A03/MF A01

We present a fully analytical approach to the study of tile confinement and stability of 'Crystalline Beams' in storage rings, in terms of such fundamental accelerator concepts as tune shift and stopband. We consider a 'Crystalline Beam' consisting of substrings, arranged symmetrically around the reference trajectory, and we examine the motion of a slightly perturbed test particle on one of them. Our approach quite naturally leads to the conclusion, that (1) storage rings need to be operated below the transition energy, and (2) the 'Crystalline Beam' has the same periodicity as the storage ring. Each 'Crystalline Beam' has an upper and lower limit of the spacing between the ions. The upper limit is determined by condition (2), and the lower limit is set by the stability of the test particle motion around the equilibrium. DOE

INDUCTION LINACS FOR HEAVY ION FUSION
R. O. Bangerter and A. Faltens Aug. 1994 4 p Presented at the 17th International LINAC Conference, Tsukuba, Japan, 21-26 Aug. 1994
(Contract DE-AC03-76SF-00098)
(DE95-002357; LBL-36067; HIFAN-671; CONF-9408125-38) Avail: CASI HC A01/MF A01

Inertial fusion target physics imposes important constraints on the design of linacs for heavy-ion fusion. The most challenging constraint from a scientific standpoint is the requirement that the accelerator deliver more than 10(exp 14) W of beam power to a small quantity (less than 100 mg) of matter. The most challenging constraint from an engineering standpoint is accelerator cost. This paper explains the target physics requirements and shows how they lead to constraints on the usual accelerator parameters such as kinetic energy, current, and emittance. It will be shown that improvements in the final focusing system would have a beneficial effect on both scientific feasibility and cost. The paper also discusses experiments that are presently underway in the United States, specifically, experiments on high-current injectors, recirculating induction accelerators, transverse beam combining, and a proposed accelerator called ILSE. Hardware development for ILSE is now in progress. DOE

EMITTANCE GROWTH DUE TO NEGATIVE-MASS INSTABILITY ABOVE TRANSITION
King-Yuen Ng Aug. 1994 14 p Presented at the Workshop on Beam Instabilities in Storage Rings, Hefei, China, 25-30 Jul. 1994
(Contract DE-AC02-76CH-03000)
(DE95-002527; FNAL/C-94/253; CONF-9407121-4) Avail: CASI HC A03/MF A01

Due to space-charge effect, there is a growth of bunch emittance across transition as a result of negative-mass instability. The models of growth at cutoff frequency and growth from high-frequency Schottky noise are reviewed. The difficulties of performing reliable simulations are discussed. An intuitive self-bunching model for estimating emittance growth is presented. DOE

NEUTRONICS AND SHIELDING ANALYSIS OF THE NATIONAL IGNITION FACILITY
J. F. Latkowski, M. T. Tobin, and M. S. Singh Jun. 1994 7 p Presented at the 11th Topical Meeting on the Technology of Fusion Energy, New Orleans, LA, 19-24 Jun. 1994
(Contract W-7405-eng-48)
(DE94-016698; UCRL-JC-115585; CONF-940630-31) Avail: CASI HC A02/MF A01

The Department of Energy (DOE) is proposing to construct the National Ignition Facility (NIF) by the year 2001 to embark on a program to achieve ignition and modest gain in the laboratory. The NIF will use 1.8 MJ of 0.35 (mu)m laser light, nearly a fifty-fold increase in energy over the Nova laser at Lawrence Livermore National Laboratory (LLNL). A 5-m radius spherical aluminum chamber will contain the target experiments and allow access to diagnostics for data collection. Based on a projected maximum annual yield of 385 MJ (1.4 x 10(exp 20) 14 MeV neutrons), prompt annual doses will be less than 1.2 (mu)Sv at the nearest site boundary, less than 0.43 mSv immediately outside the Target Area, and less than 30 (mu)Sv in the war-room and control room. The target chamber material has been selected in a trade-off between its mechanical properties and its neutron activation qualities. External target chamber shielding has been selected such that the total annual occupational dose to Target Area workers will be less than or equal to 5 mSv. Finally, some Target Area systems have been redesigned based on their neutron activation and residual dose rates. The operation of the NIF will have an insignificant impact to workers and the general population. DOE

LASER DESIGN BASIS FOR THE NATIONAL IGNITION FACILITY
J. T. Hunt, K. R. Manes, J. R. Murray, P. A. Renard, R. Sawicki, J. B. Trenholme, and W. Williams Jun. 1994 5 p Presented at the 11th Topical Meeting on the Technology of Fusion Energy, New Orleans, LA, 19-24 Jun. 1994
(Contract W-7405-eng-48)
(DE94-016700; UCRL-JC-117399; CONF-940630-35) Avail: CASI HC A01/MF A01

Controlled nuclear fusion initiated by highly intense laser beams has been the subject of experiment for many years. The National Ignition Facility (NIF) represents the culmination of design efforts to provide a laser facility that will successfully demonstrate fusion ignition in the laboratory. In this so-called inertial confinement approach, energetic driver beams (laser, X-ray, or charged particle) heat the outer surface of a spherical capsule containing deuterium and tritium (DT) fuel. As the capsule surface explosively evaporates, reaction pressure compresses the DT fuel causing the central core of the fuel to reach extreme density and temperature. When the central temperature is high enough, DT fusion reactions occur. The energy released from these reactions further heats the compressed fuel, and fusion burn propagates outward through the colder regions of the capsule much more rapidly than the inertially confined capsule can expand. The resulting fusion reactions yield many times more energy than was absorbed from the driver beams. DOE

IN-SITU CAPABILITY OF ION BEAM MODIFICATION AND CHARACTERIZATION OF MATERIALS AT LOS ALAMOS NATIONAL LABORATORY
Ning Yu, Michael Nastasi, Joseph R. Tesmer, Mark G. Hollander, Caleb R. Evans, Carl J. Maggiore, and Timothy E. Levine (Cornell Univ., Ithaca, NY.) 1994 11 p Presented at the 13th International Conference on the Application of Accelerators in Research and Industry, Denton, TX, 7-10 Nov. 1994
(Contract W-7405-eng-36)
(DE95-002738; LA-UR-94-3537; CONF-941129-8) Avail: CASI HC A03/MF A01

The capability of in-situ ion beam modification and characterization of materials developed at Los Alamos National Laboratory is described. A beam-line from a 3 MV tandem accelerator and a beam-line from a 200 kV ion implanter are joined together in an in-situ target chamber. The chamber is equipped with a cold and hot sample stage with a temperature range from -100 to 500 C. The angular (sample spin and basal rotation) motions and translational motions of the sample stage are controlled by a multi-axis goniometer. This chamber provides a unique capability to conduct a temperature dependent experiment of ion irradiation and sequential backscattering and channeling analysis. The efficiency and reliability of in-situ ion beam techniques are demonstrated by two examples, irradiation damage in (100) MgAl2O4 spinel crystals and ion-beam-induced densification of zirconia sol-gel thin films. DOE

COMPARISON OF CALCULATED WITH MEASURED DYNAMIC APERTURE
F. Zimmermann Jun. 1994 5 p Presented at the 4th European Particle Accelerator Conference, London, United Kingdom, 27 Jun. - 1 Jul. 1994
(Contract DE-AC03-76SF-00515)
(DE95-002863; SU-SLAC-PUB-6504; CONF-940618-87) Avail: CASI HC A01/MF A01

The measured dynamic aperture of the HERA proton ring and the value expected from simulation studies agree within a factor of 2. A better agreement is achieved if a realistic tune modulation is included in the simulation. The approximate threshold of tune-modulation induced diffusion can be calculated analytically. Its value is in remarkable agreement with the dynamic aperture measured. The calculation is based on parameters of resonances through order 11 which are computed using differential-algebra methods and normal-form algorithms. Modulational diffusion in conjunction with drifting machine parameters appears to be the most important transverse diffusion process. DOE

ISSUES IN MULTI-BUNCH EMITTANCE PRESERVATION IN THE NLC
K. L. F. Bane, C. Adolphsen, K. Kubo, and K. A. Thompson Jul. 1994 3 p Presented at the 4th European Particle Accelerator Conference, London, United Kingdom, 27 Jun. - 1 Jul. 1994

(Contract DE-AC03-76SF-00515)
(DE95-002894; SU-SLAC-PUB-6581; CONF-940618-94) Avail: CASI HC A01/MF A01

In the linac of the SLAC NLC design 1 nC bunches are accelerated in trains 90 bunches long with an interbunch spacing of 42 cm. In this multi-bunch design one important problem that needs to be controlled is the multi-bunch beam break-up instability. One method of controlling this instability is by detuning the transverse modes of the accelerator cavities. This is accomplished by varying the cell dimensions as one proceeds down the structure in such a way that the transverse modes are detuned, while the fundamental, accelerating mode is left unchanged. In a properly designed, gaussian detuned structure the transverse wakefield excited by the first bunch in the train can be made to cancel sufficiently at the positions of bunches 2 to 25, after which it begins to grow again. To accommodate the long NLC bunch train it was suggested to build the linac out of 4 types of structures whose modes are interleaved so that the recoherence of the wake does not begin until after the last bunch has passed. More recently, another way of avoiding the recoherence of the wake is being studied: using only one type of structure and introducing weak damping through a manifold coupled by radial slots. In this paper, however, we will consider only the earlier idea. An important consideration in the NLC linac is the tolerance to accelerator structure misalignments. We present here an approximate analytic calculation that works well for the NLC parameters with 4 structure types. DOE

SIGNALS FOR TOP QUARK ANOMALOUS CHROMOMAGNETIC MOMENTS AT COLLIDERS
Thomas G. Rizzo Jul. 1994 4 p Presented at the Meeting of the American Physical Society, Division of Particals and Fields (DPF94), Albuquerque, NM, 2-6 Aug. 1994
(Contract DE-AC03-76SF-00515)
(DE95-002896; SU-SLAC-PUB-6590; CONF-940816-48) Avail: CASI HC A01/MF A01

The Tevatron and the Next Linear Collider (NLC) will be excellent tools for probing the detailed nature of the top quark. We perform a preliminary examination of the influence of an anomalous chromomagnetic moment for the top, (kappa), on the characteristics of t(bar t) production at the Tevatron and on the spectrum of gluon radiation associated with t(bar t) production at the NLC. In particular, we analyze the sensitivity of future data to non-zero values of (kappa) and estimate the limits that can be placed on this parameter at the Tevatron and at the NLC with center of mass of energies of (radical)s = 500 and 1000 GeV. Constraints on (kappa) from low energy processes, such as b (yields) s(gamma) are briefly discussed. DOE

FIRST RESULTS FROM THE FINAL FOCUS TEST BEAM
Peter Tenenbaum (California Univ., Santa Cruz, CA.) Jul. 1994 5 p Presented at the Meeting of the American Physical Society, Division of Particals and Fields (DPF94), Albuquerque, NM, 2-6 Aug. 1994
(Contract DE-AC03-76SF-00515)
(DE95-002897; SU-SLAC-PUB-693; CONF-940816-49) Avail: CASI HC A01/MF A01

We have used the Final Focus Test Beam beamline and associated instrumentation to reduce the 46.6 GeV SLAC electron beam to a vertical size of 70 nm. This represents a reduction from the linac beam size by a factor of 320, comparable to the demagnification required by a TeV-scale linear collider, and addresses the same aberrations predicted in such an environment. The beam dimensions were measured by two novel beam size monitors at the focal point. Details of the optical and hardware design of the beam line, necessary tuning operations, beam size monitor principles, and future plans are discussed. DOE

REAL-TIME DYNAMIC SIMULATOR FOR THE TOPAZ II REACTOR POWER SYSTEM
Kwan S. Kwok 1994 8 p Presented at the 15th Aerospace Testing Seminar, Manhattan Beach, CA, 11-13 Oct. 1994
(Contract DE-AC04-94AL-85000)
(DE95-001604; SAND-94-2033C; CONF-9410181-3) Avail: CASI HC A02/MF A01

A dynamic simulator of the TOPAZ II reactor system has been developed for the Nuclear Electric Propulsion Space Test Program. The simulator is a self-contained IBM-PC compatible based system that executes at a speed faster than real-time. The simulator combines first-principle modeling and empirical correlations in its algorithm to attain the modeling accuracy and computational through-put that are required for real-time execution. The overall execution time of the simulator for each time step is 15 ms when no data is written to the disk, and 18 ms when nine double precision data points are written to the disk once in every time step. The simulation program has been tested and it is able to handle a step decrease of $8 worth of reactivity. It also provides simulation of fuel, emitter, collector, stainless steel, and ZrH moderator failures. Presented in this paper are the models used in the calculations, a sample simulation session, and a discussion of the performance and limitations of the simulator. The simulator has been found to provide realistic real-time dynamic response of the TOPAZ II reactor system under both normal and causality conditions. DOE

Present Light Ion Fusion (LIF) target experiments on PBFA 2 use a barrel diode in which the total transport length from the anode to the target is less than or equal to 15 cm. Future LIF development includes high yield applications (LMF) and energy production (ETF and LIBRA power plants) that require standoff - the generation of extracted ion beams and transport of these beams over distances of several meters. Standoff research includes the development of high efficiency extraction diodes (single stage and two-stage), improvements in beam quality (divergence, purity, uniformity, etc.), and the efficient transport and focusing of these beams over distances of several meters to a fusion target. Progress in all of these areas is discussed, as well as a strategy to reduce the divergence from the present 17 mrad for 5 MeV protons on SABRE to the required mrad for 35 MeV Li ions for LMF. The status of experiments is summarized, and future directions are indicated. DOE

MOMENT APPROACH TO HIGH-ORDER ACCELERATOR BEAM OPTICS
W. P. Lysenko 1994 30 p Presented at the 4th International Conference on Charged Particle Optics, Tsukuba, Japan, 3-6 Oct. 1994
(Contract W-7405-eng-36)
(DE95-001018; LA-UR-94-3351; CONF-9410229-1) Avail: CASI HC A03/MF A01

High-current beams must be matched to high order to minimize emittance growth and particle losses. For matching problems, the moment approach, in which the author describes the particle beam by the moments of its distributions, is particularly valuable. A variety of analytical results are available for linear motion. The moment approach is also the basis of the 3-D space-charge simulation code BEDLAM, in which the dynamical variables are the moments. Moment simulation codes are particularly useful for computing beams matched to nonlinear systems. This paper outlines what is known about the moment approach, describes work in progress on new space-charge models, and describes further potential applications of and improvements to moment-method simulations. DOE

EMITTANCE DILUTION BY IONS IN THE SLC ARCS
P. Emma, T. Raubenheimer, and F. Zimmermann Jun. 1994 3 p Presented at the 4th European Particle Accelerator Conference, London, United Kingdom, 27 Jun. - 1 Jul. 1994
(Contract DE-AC03-76SF-00515)
(DE95-002871; SU-SLAC-PUB-6522; CONF-940618-92) Avail: CASI HC A01/MF A01

Since the start of flat-beam operation in 1993 typical vertical IP spot sizes in the SLC are well below 1 micron, and the luminosity is highly sensitive to dilutions of the vertical emittance. In the arcs, the ionization of the residual gas by the bunch head gives rise to an ion cloud, whose electric field deflects the tail of the bunch and may cause an unrecoverable filamentation in phase space. The effect of the ions is particularly important in regions with large dispersion, due to the strong correlation of energy and longitudinal position within a bunch. Computer simulations of a bunch passage in the presence of ions have been performed to estimate the magnitude of the emittance dilution. DOE

N95-21334# Stanford Linear Accelerator Center, CA.
SIMULATION OF BEAM-BEAM LIFETIME FOR LEP
T. Chen, J. Irwin, and R. Siemann Jun. 1994 4 p Presented at the 4th European Particle Accelerator Conference, London, United Kingdom, 27 Jun. - 1 Jul. 1994
(Contract DE-AC03-76SF-00515)
(DE95-002888; SU-SLAC-PUB-6561; CONF-940618-110) Avail: CASI HC A01/MF A01

A program that uses a new technique to simulate die beam halo in circular e(+)e(-) colliders is applied to the LEP. This technique makes it possible to investigate tail particle in reasonable CPU times. The program now includes four interaction points and errors at or between the IP's. Analytical analysis shows that the errors break the symmetry and introduce extra low-order resonances that are forbidden by symmetry. Simulation results show the expected phenomenon. Another effect, the quadrupole mode coherent motion of the strong beam, is also studied. DOE

LUMINOSITY POLARIZATION CORRELATION IN THE SLC
F. J. Decker and J. T. Seeman Jun. 1994 4 p Presented at the 4th European Particle Accelerator Conference, London, United Kingdom, 27 Jun. - 1 Jul. 1994
(Contract DE-AC03-76SF-00515)
(DE95-002889; SU-SLAC-PUB-6562; CONF-940618-111) Avail: CASI HC A01/MF A01

In this paper we discuss the correlation between low luminosity and low polarization for off-energy particles in the Stanford Linear Collider (SLC). In the arcs of the SLC the spin of the polarized electrons has a net horizontal precession of about 25 turns. For example, a particle off energy by 1% deviates by 0.25 spin turns or a 90(degrees) rotation from the core. It reduces the average polarization measured by a Compton polarimeter near the interaction point (IP). Since the energy acceptance or bandwidth of the final focus optics is limited to a certain range (approx) +/- 0.5%, these off-energy particles are not focussed as well at the IP and thus contribute less to luminosity. Therefore, the effective polarization at the IP weighted by the luminosity is higher than the measured polarization. Relative corrections of this measured value by +0.5 to 1% for the core and another +1 to 2% for low energy beam tails seems to be necessary for the 1993 run. In 1994, beam shaping with over-compression producing lower energy spreads and smaller tails together with a new arc setup with fewer effective spin turns promise to reduce this effect by an order of magnitude. PAIR PRODUCTION AS A PROBE OF COLLIDING BEAM SIZE
Pisin Chen, John Irwin, and Anatoly Spitkovsky Jul. 1994 3 p Presented at the 4th European Particle Accelerator Conference, London, United Kingdom, 27 Jun. - 1 Jul. 1994
(Contract DE-AC03-76SF-00515)
(DE95-002893; SU-SLAC-PUB-6578; CONF-940618-93) Avail: CASI HC A01/MF A01

We propose the use of soft e(+) e(-) pairs as a non-evasive measurement of the colliding beam size. The angular distribution of the pair particles that have different sign of charge from that of the opposing beam, provides the information about the aspect ratio of the beam. The transverse momentum of the other species in the pair, on the other hand, carries information about the horizontal dimension of the beam. Together, one can in principle measure both (sigma)(sub x) and (sigma)(sub y). DOE

APPLICATION OF NEW SYNCHROTRON POWDER DIFFRACTION TECHNIQUES TO ANOMALOUS SCATTERING FROM GLASSES
M. A. Beno, G. S. Knapp, P. Armand, D. L. Price, and M. L. Saboungi Aug. 1994 14 p Presented at the International Meeting on Synchrotron Radiation Instrumentation, Stony Brook, NY, 18-22 Jul. 1994
(Contract W-31-109-eng-38)
(DE94-019285; ANL/MSD/CP-82834; CONF-940714-28) Avail: CASI HC A03/MF A01

The authors have applied two synchrotron powder diffraction techniques to the measurement of high quality anomalous scattering diffraction data for amorphous materials. One of these methods, which uses a curved perfect crystal analyzer to simultaneously diffract multiple powder lines into a position sensitive detector has been shown to possess high resolution, low background and very high counting rates. This data measurement technique provides excellent energy resolution while minimizing systematic errors resulting from detector non-linearity. Anomalous scattering data for a cesium germanate glass collected using this technique will be presented. The second powder diffraction technique uses a flat analyzer crystal to deflect multiple diffraction lines out of the equatorial plane. Calculations show that this method possesses sufficient energy resolution for anomalous scattering experiments when a perfect crystal analyzer is used and is experimentally much simpler. Future studies will make use of a rapid sample changer allowing the scattering from the sample and a standard material (a material not containing the anomalous scatterer) to be measured alternately at each angle, reducing systematic errors due to beam instability or sample misalignment. EFFECTS OF RF SIDE-BANDS ON SPECTRAL REPRODUCIBILITY FOR INFRARED SYNCHROTRON RADIATION

R. Biscardi, G. Ramirez, G. P. Williams, and C. Zimba (Polaroid Corp., Cambridge, MA.) 1994 11 p Presented at the International Meeting on Synchrotron Radiation Instrumentation, Stony Brook, NY, 18-22 Jul. 1994
(Contract DE-AC02-76CH-00016)
(DE95-002450; BNL-60862; CONF-940714-37) Avail: CASI HC A03/MF A01

We have investigated the effects of audio side-bands from the main RF of the NSLS VUV storage ring on beam motion and specifically on spectral reproducibility in the infra-red region. For this spectral region it is advantageous to use Michelson interferometers because of their high throughput (Jacquinot advantage). A second advantage is that interferometers inherently give a multiplex or Felgett advantage, since one is always looking at all the wavelengths for all of the measuring time, even though there is only one detector. In such instruments it is beneficial to scan the moving mirror at a fast rate so that any mechanical or other low frequency noise shows up as a slow modulation in the interferogram and disappears altogether in the Fourier transform from the spectral region of interest. However, audio frequency side-bands appear from the RF energy restoring cavity as noise on the beam. These always occur at multiples of 60 Hz and can thus be readily identified. They can also be confirmed by changing the mirror velocity which changes where they appear in the spectra in a predictable way. In the present work, we measured spectra while simultaneously reducing and shifting the side bands in the RF and thus were able to correlate the effects and ultimately eliminate them as a source of noise. Ultimately we were able to achieve reproducibilities of less than 1% in 15 seconds of scanning time across the entire spectral region from 800/cm to 4000/cm with a sample throughput of only 10(exp -10) sq m steradians. THE ORNL NEUTRON-CAPTURE CROSS SECTION FACILITY
R. R. Spencer, N. M. Larson, J. H. Todd, and L. W. Weston 1994 4 p Presented at the International Conference on Nuclear Data for Science and Technology: Nuclear Data for the Twenty-first Century, Gatlinburg, TN, 9-13 May 1994
(Contract DE-AC05-84OR-21400)
(DE94-019146; CONF-940507-38) Avail: CASI HC A01/MF A01

In order to meet the cross section needs required by astrophysical calculations within recent cosmological models, the neutron-capture cross section facility at the Oak Ridge Electron Linear Accelerator (ORELA) has been improved and restored to operation. Changes to the system include replacement of the C6F6 scintillation detectors with C6D6, reduction of the structural mass near and around the detectors, and incorporation of a new IBM PS/2-based data handler. Preliminary measurements on natural iron samples yield Gamma(sub n) = 61.6 +/- 1.8 meV for the 1.15-keV resonance, using a fixed Gamma(sub gamma) = 574 meV from transmission, compared to the value Gamma(sub n) = 61.7 +/- 0.9 meV obtained from the transmission measurements. PRS SCOPING STUDY. 2: ZPIMP PREDICTIONS FOR RADIATION YIELDS ON A JUPITER-CLASS GENERATOR
J. L. Giuliani, Jr., J. Rogerson, and J. Davis 31 May 1994 37 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A279823; NRL/MR/6720-94-7472-2) Avail: CASI HC A03

A limited radiation-magnetohydrodynamics simulation code, ZPIMP, is used to predict radiation yields in various energy bins on a JUPITER-class machine. Elements of the simulation code are reviewed and calculations are made to compare the code with experimental K-shell yields from aluminum z-pinches on the SATURN generator. For a chosen viscosity parameter the simulated yields agree remarkably with the data. The same code is applied on an early version of the linear inductive voltage adder, but the projected krypton yields arc disappointing. By increasing the compression through a lower viscosity parameter, the subsequent yields are significantly improved for weak implosions, showing that such a case is highly sensitive to the details of the dynamics. The capabilities of an approximately 60 MA JUPITER-class generator are surveyed with the ZPIMP code and the results for argon, krypton, and xenon are compared against the anticipated required source yields in five energy bins ranging from 0 to 60 keV. In the lowest bins (0-1 and 1-5 keV) JUPITER is well suited to reach the required yields, but in the highest bins (15-30 and 30-60 keV) the present calculations indicate that improvements in load design, understanding, and control are necessary to meet the requirements. Limitations of the ZPIMP calculations and directions for improving the PRS estimates for JUPITER are derived from the present work. DTIC

BEAM INSTABILITY STUDIES AT THE APS
L. C. Teng 1994 16 p Presented at the Workshop on Beam Instabilities in Storage Rings, Hefei, China, 25-30 Jul. 1994
(Contract W-31-109-eng-38)
(DE95-001448; ANL/ASD/CP-84183; CONF-9407121-3) Avail: CASI HC A03/MF A01

The Argonne Advanced Photon Source, APS, is a 7-GeV positron storage ring with a circumference of 1104 m. It has a 'third generation, DBA or Chasman-Green' lattice composed of 40 sectors each having an approximately 6 m long zero-dispersion straight-section for accommodating insertion devices. Neighboring straight-sections are connected by a 360 deg/40 = 9 deg double-bend-achromatic bending section designed to produce the smallest emittance attainable with reasonable component parameter values and dynamic apertures. Thus, it is a very strongly focusing lattice with v(sub x) = 35.22 and v(sub y) = 14.30. The beam chamber of the storage ring including all rf, vacuum, and photon beam components is designed to ensure that a beam current greater than 100 mA can be stably stored. We expect that the maximum stable beam current could be as high as 300 mA. This paper will give some details of the studies and computations to ensure the stability of such a beam. The discussions will be organized in the following three parts: coupled-bunch instability caused by the higher-order modes (HOM's) of the RF cavities; single-bunch instability due to the resistive wall impedance; and single-bunch instability due to broadband impedances arising from beam chamber irregularities. PROGRESS IN THE LIGHT ION DRIVEN INERTIAL CONFINEMENT FUSION PROGRAM
J. P. Quintenz, T. A. Mehlhorn, R. G. Adams, G. O. Allshouse, J. H. Aubert, L. D. Bacon, J. E. Bailey, D. D. Bloomquist, J. Boyes, and G. A. Chandler et al 1994 8 p Presented at the 15th International Conference on Plasma Physics and Controlled Nuclear Fusion Research, Seville, Spain, 26 Sep. - 1 Oct. 1994
(Contract DE-AC04-94AL-85000)
(DE94-019182; SAND-94-0977C; IAEA-CN-60/B-1-I-6; CONF-940933-2) Avail: CASI HC A02/MF A01

The goal of the light ion inertial confinement fusion (ICF) program is high fusion yield for defense and energy applications. The first lithium-driven hohlraum experiments at 1400 TW/g are reported. The lithium beam intensity is presently limited to 1.4 +/- 0.4 TW/cm(exp 2) (averaged over a 6 mm diameter sphere) due to a combination of beam divergence and limited lithium beam power. Surface contamination in the diode plays an important role in limiting the lithium power. Concepts have been developed for beam transport over several meters. Synergism exists between light- and heavy-ion ICF in areas such as transport and target physics. DOE

RF BEAM CONTROL FOR THE AGS BOOSTER
J. M. Brennan 26 Sep. 1994 112 p
(Contract DE-AC02-76CH-00016)
(DE95-001485; BNL-52438; AGS/AD-94-6) Avail: CASI HC A06/MF A02

RF beam control systems for hadron synchrotrons have evolved over the past three decades into an essentially standard design. The key difference between hadron and lepton machines is the absence of radiation damping and existence of significant frequency variation in the case of hadrons. Although the motion of the hadron in the potential well of the RF wave is inherently stable it is not strongly damped. Damping must be provided by electronic feedback through the accelerating system. This feedback is typically called the phase loop. The technology of the RF beam control system for the AGS Booster synchrotron is described. First, the overall philosophy of the design is explained in terms of a conventional servo system that regulates the beam horizontal position in the vacuum chamber. The concept of beam transfer functions is fundamental to the mathematics of the design process and is reviewed. The beam transfer functions required for this design are derived from first principles. An overview of the beam signal pick-ups and high level RF equipment is given. The major subsystems, the frequency program, the heterodyne system, and beam feedback loops, are described in detail. Beyond accelerating the beam, the RF system must also synchronize the bunches in the Booster to the buckets in the AGS before transfer. The technical challenge in this process is heightened by the need to accomplish synchronization while the frequency is still changing. Details of the synchronization system are given. This report is intended to serve two purposes. One is to document the hardware and performance of the systems that have been built. The other is to serve as a tutorial vehicle from which the non-expert can not only learn the details of this system but also learn the principles of beam control that have led to the particular design choices made. THE 12-GeV/c BEAM TRANSFER AND ABSORBER LINES FOR THE SUPERCONDUCTING SUPER COLLIDER
N. Mao, J. McGill, R. Gerig, and K. Brown (Stanford Linear Accelerator Center, CA.) Aug. 1994 13 p
(Contract DE-AC35-89ER-40486)
(DE95-002100; SSCL-678) Avail: CASI HC A03/MF A01

The beam optics of the 12-GeV/c proton beam transfer line between the Low Energy Booster (LEB) and the Medium Energy Booster (MEB) at the Superconducting Super Collider is presented. The beam is extracted from the LEB vertically and is injected into the MEB through a vertical Lambertson magnet and a horizontal kicker. The beamline has high flexibility for amplitude and dispersion function matching. Effects of various errors in the transfer line are studied, and a beam position correction scheme is proposed. The beam optics of the 12-GeV/c absorber line transporting the beam from the LEB to an absorber during the LEB commissioning is also presented. DOE

SELECTION OF RIB TARGETS USING ION IMPLANTATION
G. D. Alton, J. Dellwo, J. A. Chediak, H. K. Carter (Oak Ridge Inst. for Science and Education, TN.), and J. Kormicki (Oak Ridge Inst. for Science and Education, TN.) 1994 3 p Presented at the 4th European Particle Accelerator Conference, London, England, 27 Jun. - 1 Jul. 1994
(Contract DE-AC05-84OR-21400)
(DE95-000951; CONF-940618-81) Avail: CASI HC A01/MF A01

Experimental studies are under way at the Oak Ridge National Laboratory (ORNL) which are designed to measure the time evolution, ionization efficiencies, and release efficiencies of implanted elements diffused from refractory target materials which are candidates for forming radioactive ion beams (RIB's) at the Holifield Radioactive Ion Beam Facility (HRIBF). The diffusion coefficients are derived by comparing experimental data with numerical solutions to a one-dimensional form of Fick's second law for ion implanted distributions. In this report, we describe the experimental arrangement and provide time release data and diffusion coefficients for releasing ion implanted Cl from Zr5Si3 and As(75), Br(79), and Se(78) from Zr5Ge3. EXPERIENCE AT THE LOS ALAMOS MESON PHYSICS FACILITY WITH THE USE OF ALLOY INCONEL 718 AS AN ENCLOSURE FOR A BEAM DEGRADER AND AS A PROTON BEAM ENTRY WINDOW
W. F. Sommer, P. D. Ferguson, R. D. Brown, C. M. Cedillo, and E. Zimmerman 1994 27 p Presented at the International Conference on Accelerator-driven Transmutation Technologies and Applications, Las Vegas, NV, 25-28 Jul. 1994
(Contract W-7405-eng-36)
(DE94-018289; LA-UR-94-2809; CONF-9407103-24) Avail: CASI HC A03/MF A01

Operation of the Los Alamos Meson Physics Facility (LAMPF) began in 1972 and continues at present. An injector delivers protons to a 0.8 km long line ar accelerator which produces a particle energy of 800 MeV; the protons are then transported to a variety of experimental areas. The proton beam is transported in a vacuum tube, controlled and bent by electromagnets. The highest intensity beam, at a maximum level of 1 mA, is delivered to the experimental area designated as Area A. At the end of the experimental area, the beam is transported through an interface between beamline vacuum and one atmosphere air pressure. This interface is made of metal and is generally referred to as a beam entry window. At LAMPF, after the beam has exited the vacuum tube, it becomes incident on a number of experiments or 'targets.' These include capsules for radiation damage studies, a beam 'degrader' for the long-term neutrino experiment, and as many nine targets in the Isotope Production (IP) stringer system used to produce medically significant isotopes. Following the IP system is a beam stop used for the purpose its name implies. The beam stop also contains a beam entry window, whose purpose is to separate the 250 psig water cooling environment from 1 atmosphere of air. The beam entry window, the beam degrader, and the beam stop window are made of alloy Inconel 718, have endured a lengthy irradiation service time at LAMPF, and are the subject of this report. DOE

NEW TECHNIQUES IN NEUTRON SCATTERING
John B. Hayter 1994 10 p Presented at the 5th International Symposium on Advanced Nuclear Energy Research, Mito, Japan, 10-12 Mar. 1993
(Contract DE-AC05-84OR-21400)
(DE94-018944; CONF-9303258-1) Avail: CASI HC A02/MF A01

New neutron sources being planned, such as the Advanced Neutron Source (ANS) or the European Spallation Source (ESS), will provide an order of magnitude flux increase over what is available today, but neutron scattering will still remain a signal-limited technique. At the same time, the development of new materials, such as polymer and ceramic composites or a variety of complex fluids, will increasingly require neutron-based research. This paper will discuss some of the new techniques which will allow us to make better use of the available neutrons, either through improved instrumentation or through sample manipulation. Discussion will center primarily on unpolarized neutron techniques since polarized neutrons will be the subject of the next paper. DOE

PROPOSED EMITTANCE UPGRADE FOR THE SLC DAMPING RINGS
R. Early, T. Limberg, H. Moshammer, T. Raubenheimer, K. Skarpaas, and J. Spencer Jun. 1994 4 p Presented at the 4th European Particle Accelerator Conference, London, United Kingdom, 27 Jun. - 1 Jul. 1994
(Contract DE-AC03-76SF-00515)
(DE95-002887; SU-SLAC-PUB-6559; CONF-940618-109) Avail: CASI HC A01/MF A01

One way to improve luminosity is to reduce transverse emittance by changing damping partitions. We consider the options in relation to the constraints. Besides modifications of the basic DR configuration the options include closed-orbit offsets in the quadrupoles, addition of strong multipoles and replacement of existing rectangular nosepieces on the dipoles (shim angles (phi)(equivalent to)(theta)/2) with rotatable inserts. Measurements indicate the possibility of dynamically tuning (phi) greater than or equal to 45(degrees) with decreases in (tau)(sub x) and (epsilon)(sub x) of greater than or equal to 50%. We discuss damping mechanisms to motivate the desirable field characteristics as well as nonlinear contours to cancel dipole harmonic errors (B greater than 2T here) or to provide chromatic corrections. Such inserts could also be used to make cheaper, more compact rings with better impedance by reducing the number of conventional multipoles without impairing the stability. Estimated hardware costs are $250/dipole end or multipole equivalent. DOE

(DE95-000562; FNAL/C-94/257-E; CONF-9405233-1) Avail: CASI HC A02/MF A01

Future colliding beam runs at Fermi National Accelerator Laboratory will involve bunch spacings of protons and antiprotons at 132 ns intervals. Due to finite processing time, a pipelined architecture is needed to store events until a trigger decision can reach the detector. A single ported pipeline design has been implemented in a 1.2 micron rad soft CMOS technology and partially tested. Results are presented of the performance of that design. The chip supports a level 1 accept rate of 5 kHz. Because high statistics B physics experiments will require level 1 accept rates of 50 kHz, a new dual ported pipeline device has been proposed which would make the readout virtually deadtimeless for trigger rates approaching 50 kHz. The operation of the proposed deadtimeless device is explained. DOE

Several countries are now involved in efforts aimed at utilizing accelerator-driven technologies to solve problems of national and international importance. These technologies have both economic and environmental implications. The technologies include waste transmutation, plutonium conversion, neutron production for materials science and biological science research, neutron production for fusion materials testing, fission energy production systems, and tritium production. All of these projects require a high-intensity linear accelerator that operates with extremely low beam loss. This presents a formidable computational challenge: One must design and optimize over a kilometer of complex accelerating structures while taking into account beam loss to an accuracy of 10 parts per billion per meter. Such modeling is essential if one is to have confidence that the accelerator will meet its beam loss requirement, which ultimately affects system reliability, safety and cost. At Los Alamos, the authors are developing a capability to model ultra-low loss accelerators using the CM-5 at the Advanced Computing Laboratory. They are developing PIC, Vlasov/Poisson, and Langevin/Fokker-Planck codes for this purpose. With slight modification, they have also applied their codes to modeling mesoscopic systems and astrophysical systems. In this paper, they will first describe HPC activities in the accelerator community. Then they will discuss the tools they have developed to model classical and quantum evolution equations. Lastly they will describe how these tools have been used to study beam halo in high current, mismatched charged particle beams. DOE

RECENT RESULTS IN ANALYSIS AND SIMULATION OF BEAM HALO
R. D. Ryne and T. P. Wangler 1994 8 p Presented at the International Conference on Accelerator-driven Transmutation Technologies and Applications, Las Vegas, NV, 25-28 Jul. 1994
(Contract W-7405-eng-36)
(DE94-018313; LA-UR-94-2903; CONF-9407103-26) Avail: CASI HC A02/MF A01

Understanding and predicting beam halo is a major issue for accelerator driven transmutation technologies. If strict beam loss requirements are not met, the resulting radioactivation can reduce the availability of the accelerator facility and may lead to the necessity for time-consuming remote maintenance. Recently there has been much activity related to the core-halo model of halo evolution. In this paper the authors will discuss the core-halo model in the context of constant focusing channels and periodic focusing channels. They will present numerical results based on this model and they will show comparisons with results from large scale particle simulations run on a massively parallel computer. They will also present results from direct Vlasov simulations. DOE

VERY HIGH-POWER ELECTRON-BEAM TRANSPORT IN LONG GAS CELLS FROM 10(EXP -3) TO 10(EXP 3) TORR N2
T. W. L. Sanford 1994 19 p Presented at the Meeting of the Division of Plasma Physics of the American Physical Society, Minneapolis, MN, 7-11 Nov. 1994
(Contract DE-AC04-94AL-85000)
(DE95-002611; SAND-94-1911C; CONF-941101-1) Avail: CASI HC A03/MF A01

Measurements and analyses show that the 13-TW, pulsed Hermes-III electron beam, with current near the Alfven limit, has two regimes of stable transport: a low-pressure window (between (approximately)1 and (approximately)100 mTorr) that is dominated by propagation in the semi-collisionless IFR (ion-focused regime), and a high-pressure window (between (approximately)1 and (approximately)100 Torr) that is dominated by propagation in the resistive CDR (collision-dominated regime). Propagation in both regimes (the IFR at early time and the CDR at later time) is observed from (approximately)10 to (approximately)100 mTorr. Below (approximately)1 mTorr, there is insufficient ionization to confine the beam. As the pressure increases, two-stream instabilities terminate IFR propagation earlier in time. Above 10 mTorr, this instability is sufficiently quenched by gas collisions that CDR propagation in the beam body occurs. Above (approximately)100 mTorr, the gas breaks down too rapidly for a significant IFR pulse to form, and for higher pressures only a single pulse in the CDR is propagated. Between (approximately)100 mTorr and (approximately)1 Torr, however, the hollowing instability and lack of magnetic confinement limit CDR propagation, and above (approximately)100 Torr, the resistive hose instability again degrades propagation. BUNCHED BEAM INSTABILITY WITH FREQUENCY SPREAD
S. Y. Zhang and W. T. Weng 1994 21 p Presented at the Workshop on Beam Instabilities in Storage Rings, Hefei, China, 25-30 Jul. 1994
(Contract DE-AC02-76CH-00016)
(DE94-018632; BNL-60749; CONF-9407121-2) Avail: CASI HC A03/MF A01

The eigenvalue type solution to the bunched beam instability with frequency spread is studied. The approach provides a comprehensive solution to the problem by including all necessary modes. The synchrotron frequency spread is represented by a mode decomposition, the decomposed modes have different inherent frequencies from each other, and the corresponding radial functions are different from the ones without frequency spread. The environmental impedance induced feedback applies to these modes and then creates Landau damping effect. The radial modes and therefore the line densities can be solved throughout the Landau damping, thus providing some insight into the process. Several conceptual and computational problems are discussed, and the method is compared with the conventional Landau damping treatment. Finally, the case of mode coupling is also discussed. DOE

VERTEX DETECTORS AT LINEAR COLLIDERS: PRESENT AND FUTURE
C. J. S. Damerell Sep. 1994 13 p 3rd Workshop on Vertex Detectors, Bloomington, IN, May 1994 See also PB87-124426
(PB95-134656; RAL-94-096) Avail: Issuing Activity (National Technical Information Service (NTIS))

After a brief introduction to the general characteristics of pixel-based vertex detectors (as opposed to those using silicon microstrips) the authors give a general description of the operation of SLD's current CCD-based vertex detector. There follows a description of the design and early prototyping for the SLD upgrade detector, due to be completed during 1995. Finally, the authors discuss ideas for an extremely powerful vertex detector suggested for use at the future e(+)e(-) linear collider. NTIS

LOW EMITTANCE LATTICES FOR ELECTRON STORAGE RINGS REVISITED
D. Trbojevic and E. Courant 1994 4 p Presented at the 4th European Particle Accelerator Conference, London, England, 27 Jun. - 1 Jul. 1994
(Contract DE-AC02-76CH-00016)
(DE94-017302; BNL-49932; CONF-940618-49) Avail: CASI HC A01/MF A01

Conditions for the lowest possible emittance of the lattice for electron storage rings are obtained by a simplified analytical approach. Examples of electron storage lattices with minimum emittances are presented. A simple graphical presentation in the normalized dispersion space (Floquet's transformation) is used to illustrate the conditions and results. DOE

LOW-LEVEL RF CONTROL FOR THE AFEL
C. Ziomek, J. Kinross-Wright, and J. Plato 1994 5 p Presented at the 16th International Free Electron Laser Conference, Stanford, CA, 21-26 Aug. 1994
(Contract W-7405-eng-36)
(DE94-018295; LA-UR-94-2840; CONF-9408146-2) Avail: CASI HC A01/MF A01

A limiting factor in the performance of the Los Alamos Advanced Free Electron Laser (AFEL) is the stability of the RF accelerating field. A high-performance low-level RF control system has been implemented that uses analog feedback and digital feed forward to regulate the RF field. This low-level RF control system has achieved long-term amplitude and phase stabilities better than +/- 0.25% and +/- 0.33 deg respectively. In order to improve the RF field stability further, a detailed system analysis and design is proceeding. Subsystem measurements are being used to model the system performance, predict the performance-limiting components, and determine possible improvements. Results to-date, modeling analyses, and suggested future improvements are presented. DOE

TARGET ALIGNMENT IN THE NATIONAL IGNITION FACILITY
Charles S. Vann, Erlan S. Bliss, and James E. Murray Jun. 1994 6 p Presented at the 11th Topical Meeting on the Technology of Fusion Energy, New Orleans, LA, 19-24 Jun. 1994
(Contract W-7405-eng-48)
(DE94-015559; UCRL-JC-115588; CONF-940630-29) Avail: CASI HC A02/MF A01

Accurate placement of hundreds of focused laser beams on target is necessary to achieve success in the National Ignition Facility (NIF). The current system requirement is less than or equal to 7 micro rad error in output pointing and less than or equal to 1 mm error in focusing. To accommodate several system shots per day, a target alignment system must be able to align the target to chamber center, inject an alignment beam to represent each shot beam, and point and focus the alignment beams onto the target in about one hour. At Lawrence Livermore National Laboratory, we have developed a target alignment concept and built a prototype to validate the approach. The concept comprises three systems: the chamber center reference, target alignment sensor, and target alignment beams. DOE

DESIGN, SYNTHESIS AND CHARACTERIZATION OF NOVEL NONLINEAR OPTICAL MATERIALS Annual Report, 1 Apr. 1993 - 31 Mar. 1994
Paras N. Prasad 31 Mar. 1994 13 p
(Contract F49620-93-C-0017)
(AD-A285617; AFOSR-94-0649TR) Avail: CASI HC A03/MF A01

This project consisted of four tasks each dealing with a different class of nonlinear optical materials. Task 1 involved second-order material. During the past year we used theoretical and experimental studies to develop a new class of materials in which a commonly used electron donor chromophore was replaced by a thiophene ring. To efficiently pole a second-order ionic chromophore, the use of a bulky counter-ion in order to reduce ionic conductivity was demonstrated. We also investigated the imaginary part of X(2) by electro-absorption. Task 2 covered third-order materials. We synthesized a group of phosphoylides which contain a polarizable P atom. Their X(3) behavior was experimentally investigated using femtosecond Kerr gate. Using our new method of optically heterodyned and phase-tuned Kerr gate method, we investigated both the signs and the magnitudes of the real and the imaginary components of X(3). We showed that in the case of one-photon saturation, the sign of imaginary part is negative, while for two-photon absorption, this sign is positive. A very efficient two-photon induced fluorescence was also found for another nonlinear chromophore, diethylaminonitrostyrene, in the crystalline form. Task 3 investigated photorefractive polymeric composites, while task 4 covered sol-gel processed nonlinear optical materials. DTIC

THE ANL X6B BEAMLINE AT NSLS: A VERSATILE FACILITY
K. G. Huang, M. Ramanathan, and P. A. Montano (Illinois Univ., Chicago, IL.) Jul. 1994 14 p Presented at the International Meeting on Synchrotron Radiation Instrumentation, Stony Brook, NY, 18-22 Jul. 1994
(Contracts W-31-109-eng-38; DE-AC02-76CH-00016)
(DE94-018379; ANL/MSD/CP-82679; CONF-940714-21) Avail: CASI HC A03/MF A01

We have described the x ray optics and beamline performance of the ANL X6B beam line at the NSLS. Considerable flexibility has been built into the beam line to accommodate a wide range of x ray diffraction, scattering, and spectroscopy experiments with various requirements. We presented selected examples of experimental results and showed that with the high intensity, high energy resolution, high-q resolution, and energy tunability, the X6B beam line has become a versatile facility. TECHNICAL DIGEST: EIGHTH SYMPOSIUM ON OPTICAL FIBER MEASUREMENTS
G. W. Day, ed., D. L. Franzen, ed., and R. K. Hickernell, ed. Sep. 1994 233 p Symposium held in Boulder, CO, 13-15 Sep. 1994; sponsored by IEEE and Optical Society of America See also PB93-102259
(PB94-207636; NIST/SP-864) Avail: CASI HC A11/MF A03; SOD HC

The Digest contains the manuscripts of 50 papers, 10 invited and 40 contributed, presented at the eighth Symposium on Optical Fiber

Measurements, September 13-15, 1994 in Boulder, Colorado. The most significant theme of the symposium is the present importance of polarization measurements. More than 20% of the papers are concerned either with polarization measurements, especially polarization mode dispersion and polarization dependent loss, or the characterization of fibers and components with special polarization properties. Optical time-domain reflectometry (OTDR) measurements are another important theme, as they have been since the first Symposium in 1980, and the characterization of optical fiber amplifiers continues to be important. Nonlinear processes in fibers seem to be a growing interest. Approximately two thirds of the papers come from outside of the United States, up from about half at the seventh Symposium. Ten countries are represented in the program. NTIS

VISIBLE LIGHT EMITTING MATERIALS AND INJECTION DEVICES Quarterly Progress Report, 1 Jun. - 31 Aug. 1994
Paul H. Holloway 31 Aug. 1994 29 p
(Contract N00014-92-J-1895)
(AD-A284796) Avail: CASI HC A03/MF A01

We completed an extensive investigation this quarter into the influence of growth parameters (including dopant source condition) on the free-hole concentration in p-type ZnSe:N epilayers which involved real-time in situ cathodoluminescence intensity measurements during growth as well as ex situ Hall-effect measurements on a number of selected samples. The parameters varied included nitrogen plasma integrated intensity, substrate temperature and II/VI beam equivalent pressure ratio. CL intensity measurements were made in situ during epilayer growth. These measurements could be made in real-time as the various growth parameters were modified. In addition, free-hole concentrations were measured in films growth under particular conditions using the sample configuration. The ohmic contact mesas were deposited in situ through a mechanical mask which was introduced over the sample following the growth of the p-doped epilayer. DTIC

AN INTENSITY INTERFEROMETER FOR SOFT X-RAYS
L. Yang, I. McNulty, and E. Gluskin 15 Jul. 1994 14 p Presented at the International Meeting on Synchrotron Radiation Instrumentation, Stony Brook, NY, 18-22 Jul. 1994
(Contracts W-31-109-eng-38; DE-AC02-76CH-00016)
(DE94-016370; ANL/XFD/CP-82881; CONF-940714-2) Avail: CASI HC A03/MF A01

We designed and built an intensity interferometer to characterize the spatial coherence of a soft x-ray undulator beam. The beam source size and shape can be determined from the measured coherence function. The instrument is 400 mm long and is mounted on a standard 204-mm diameter flange. This compact design is readily adaptable to other beamlines with sources of sufficient spectral brightness. Details of the interferometer design and performance are presented. We anticipate that when this technique is mature, it will provide a useful diagnostic for high brightness x-ray beams. DOE

OPTICAL MULTILAYERS WITH AN AMORPHOUS FLUOROPOLYMER
R. Chow, G. E. Loomis, and E. F. Lindsey Jul. 1994 8 p Presented at the Annual Meeting of the Society of Photo-Optical Instrumentation Engineers, San Diego, CA, 24-29 Jul. 1994
(Contract W-7405-eng-48)
(DE94-017693; UCRL-JC-114328; CONF-940723-17) Avail: CASI HC A02/MF A01

Multilayered coatings were made by physical vapor deposition (PVD) of a perfluorinated amorphous polymer, Teflon AF2400, together with other optical materials. A high reflector at 1064 run was made with ZnS and AF2400. An all-organic 1064-nm reflector was made from AF2400 and polyethylene. Oxide (HfO2, SiO2) compatibility was also tested. Each multilayer system adhered to itself. The multilayers were influenced by coating stress and unintentional temperature rises during PVD deposition. DOE

PRELIMINARY EVALUATION OF A DIGITAL OPTICAL SYSTOLIC PROCESSOR IMPLEMENTED WITH ACOUSTO-OPTIC CELLS Report, Jul. 1989 - Dec. 1992
James B. Rosetti, Rebecca J. Bussjager, David R. Christie, Stuart I. Libby, and Joanne H. Maurice Oct. 1994 24 p
(AF Proj. 4600)
(AD-A286377; RL-TR-94-157) Avail: CASI HC A03/MF A01

Two multichannel acoustic-optic cells were imaged onto one another, and the output was optically summed to a linear photodiode array. By sending periodic data streams into this primitive processor and monitoring the output data stream, an evaluation was made as to the potential feasibility of this type of architecture. It was shown that a 630 million logical instructions per second processor was feasible. However, there is considerable overhead in implementing higher order functions such as addition and multiplication which reduced the computational capability to 4.5 million additions per second and 260 thousand multiplications per second. CHARACTERIZATION OF AN EXPANDED-FIELD SCHWARZSCHILD OBJECTIVE FOR EXTREME ULTRAVIOLET LITHOGRAPHY
G. D. Kubiak, D. A. Tichenor, and A. K. Ray-Chaudhuri et al 1994 16 p Presented at the Electron Ion and Photon Beams Symposium, New Orleans, LA, Jun. 1994
(Contract DE-AC04-94AL-85000)
(DE94-016780; SAND-94-8619C; CONF-9406231-1) Avail: CASI HC A03/MF A01

The performance of a new 10x-reduction Schwarzschild system for projection imaging at 13.4 nm wavelength is reported. The optical design is optimized to achieve 0.1 (mu)m resolution over a 0.4 mm image field of view, an increase in area of a factor of 100 over previous designs. An off-set aperture, located on the convex primary, defines an unobscured 0.08 numerical aperture. The system is illuminated using extreme ultraviolet (EUV) radiation emitted from a laser plasma source and collected by an ellipsoidal condenser. A 450 turning mirror is used to relay the collected EUV radiation onto a near-normal reflecting mask. Multiple sets of primary and secondary elements were fabricated, matched and clocked to minimize the effects of small figure errors on imaging performance. Optical metrology indicates that the wave-front error within the subaperture used is within a factor of two of the design value. Images recorded in PMMA and ZEP 520 resists reveal good imaging fidelity over much of the 0.4 mm field with equal line/space gratings being resolved to 0.1 (mu)m. DOE

REFRACTIVE INDEX CHANGE IN DISSOCIATING SHOCKED BENZENE
D. J. Erskine Jun. 1994 23 p
(Contract W-7405-eng-48)
(DE94-019015; UCRL-ID-116660) Avail: CASI HC A03/MF A01

A calculation is made of the refractive index of a shocked solution of hydrocarbon species and spheroidal carbon particles that would be the dissociation products of benzene. The results are evaluated for benzene shocked to 15 GPa, both for an arbitrary endpoint distribution of products and reactant, and for a specific endpoint distribution suggested by a statistical-mechanical calculation. In the case of diamond particles, the refractive index is predicted to decrease by a small amount (from 1.96 to 1.75) as the dissociation proceeds. In the case of graphite particles of large oblateness, the refractive index could increase significantly through the dissociation (from 1.96 to 2.75 for infinitely oblate platelets). Thus the measurement of the time dependent refractive index through the dissociation of shocked benzene can indicate the morphology of the carbon particulates as well as the time scale for this reaction. We propose using the refractive index as a measure of completion of the dissociation reaction. This would allow a determination of the instantaneous amount of carbon in particulate form, information which is valuable in conjunction with Mie scattering experiments for example. DOE

HIGH PRECISION WOELTER OPTIC CALIBRATION FACILITY

R. I. Morales, B. A. Remington, and T. Schwinn 2 May 1994 14 p Presented at the 10th Topical Conference on High-Temperature Plasma Diagnostics, Rochester, NY, 8-12 May 1994
(Contract W-7405-eng-48)
(DE94-016973; UCRL-JC-116181; CONF-940552-27) Avail: CASI HC A03/MF A01

We have developed an off-line facility for very precise characterization of the reflectance and spatial resolution of the grazing incidence Woelter Type 1 x-ray optics used at Nova. The primary component of the facility is a high brightness, 'point' x-ray source consisting of a focussed DC electron beam incident onto a precision manipulated target/pinhole array. The data are recorded with a selection of detectors. For imaging measurements we use direct exposure x-ray film modules or an x-ray CCD camera. For energy-resolved reflectance measurements, we use lithium drifted silicon detectors and a proportional counter. An in situ laser alignment system allows precise location and rapid periodic alignment verification of the x-ray point source, the statically mounted Woelter optic, and the chosen detector. DOE

OPTICAL PROPERTIES OF SILICON CLUSTERS DEPOSITED ON THE BASAL PLANE OF GRAPHITE

L. N. Dinh, L. L. Chase, M. Balooch, L. J. Terminello, R. J. Tench, and F. Wooten Apr. 1994 12 p Presented at the Spring Meeting of the Materials Research Society, San Francisco, CA, 4-8 Apr. 1994
(Contract W-7405-eng-48)
(DE94-017529; UCRL-JC-116430; CONF-940411-51) Avail: CASI HC A03/MF A01

Laser ablation was used to deposit of silicon on highly oriented pyrolytic graphite surfaces in an ultra high-vacuum environment equipped with Auger electron spectroscopy (AES), scanning tunneling microscopy (STM) and luminescence spectroscopy. For deposition of up to several monolayers, post annealing produced silicon clusters, whose size distribution was determined vs annealing time and temperature using STM. Pure silicon clusters ranging from 1 to 10 nm showed no detectable photoluminescence in visible range. Exposure to oxygen at 10(exp -6) Torr and for up to 8 hours showed adsorption on the surface of the clusters without silicon oxide formation and no detectable luminescence. Hydrogen termination of these clusters was accomplished by exposing them to atomic hydrogen beam but did not result in any photoluminescence. Prolonged exposure of these clusters to ambient air, however, resulted in strong photoluminescence spectra with color ranging from red to greenish-blue depending on average cluster size. Auger electron spectra revealed the existence of partially oxidized silicon clusters. This luminescence could be due to either an oxide phase or to changes in electronic structure of the clusters as a result of quantum confinement effect. DOE

ANALYSIS OF DIRECT DETECTION LIGHTWAVE SYSTEMS WITH OPTICAL AMPLIFIERS M.S. Thesis

Enver Kucukerman Jun. 1994 71 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A284077) Avail: CASI HC A04

We provide a detailed analysis of direct detection lightwave systems employing an optical preamplifier at the receiver and derive the closed form expression for the bit error probability of WDM systems employing on-off keying (OOK) as modulation format. In our analysis, we consider various cases in which the receiver model uses either a finite-time integrator or Fabry-Perot filter operating in a single channel or multi-channel environment. We take into account the optical amplifier noise, the postdetection receiver noise, the shot noise, and the effect of the nonzero laser linewidth. DTIC

WHITE-LIGHT SPECTRAL ANALYSIS OF LITHIUM NIOBATE WAVEGUIDES

C. F. McConaghy, K. F. Hugenberg, D. Sweider, M. Lowry, and R. A. Becker (Integrated Optical Circuit Consultants, Cupertino, CA.) Jul. 1994 6 p Presented at the Symposium on Optical Fiber Measurements, Boulder, CO, 13-15 Sep. 1994 Revised
(Contract W-7405-eng-48)
(DE94-016692; UCRL-JC-115292-Rev-1; CONF-9409180-1-Rev-1) Avail: CASI HC A02/MF A01

Optical channel waveguides in lithium niobate are a very useful technique for building a variety of integrated optical components such as modulators, splitters, and frequency doublers. In many of these applications, single mode performance is essential in order to achieve the desired device performance. Determination of single-mode operation can be complicated by the fact that a multimode guide can support lower order modes and can appear single mode if the launch conditions for the light into the guide do not excite any of the higher order modes. Typical measurements often made to assure single-mode operation include optical mode spot imaging, and the 'blink test'. While these measurements are useful, they are strictly qualitative in nature, and thus do not provide the fine detail often desired in practice. In developing waveguide fabrication processes, it is more helpful to know how various process steps affect the wavelength at which the waveguide is single-mode, multi-mode and cut-off. In this paper, we show the usefulness of exciting waveguides with a broadband white-light source and observing the output of the guides over much of the visible and near IR spectrum with a spectrometer. Although this technique is not new, its usefulness in process development and control has not been emphasized. DOE

RESONANT TUNNELING QUANTUM WELL INTEGRATED OPTICAL WAVEGUIDE MODULATOR/SWITCH Final Report, 1 Dec. 1993 - 31 May 1994

Andrew Kostrzewski Jul. 1994 33 p
(Contract F49620-94-C-0008)
(AD-A285142; AFOSR-94-0573TR) Avail: CASI HC A03/MF A01

In this Phase 1 program, Physical Optics Corporation (POC) has investigated resonant tunneling double barrier quantum wells (RTDBQW) for application to all-optical communication networks. The RTDBQW can be used as a building block in superfast SONET/ATM network. The proposed concept relies on the integration of an optical guided wave modulator with the RTDBQW. Several waveguide modulator architectures have been investigated, including Mach-Zehnder directional couplers. A Mach-Zehnder interferometer has been selected for the final implementation and will provide high performance. The major advantage of the proposed integrated optical waveguide modulators/switch is that it uses low voltage due to the use of the high efficiency RTDBQW diode. This, in turn, increase the theoretical speed limit of the device to the femtosecond regime. One important feature of the RTDBQW device is that its response time is limited by quantum tunneling time, not by the conventional diode transit time, which leads to high speed operation. DTIC

A FRAMEWORK FOR SEGMENTATION USING PHYSICAL MODELS OF IMAGE FORMATION
Bruce A. Maxwell and Steven A. Shafer 10 Dec. 1993 36 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F33615-90-C-1465; ARPA Order 7597)
(AD-A279900; CMU-RI-TR-93-29) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Most approaches to computer image segmentation group sets of pixels according to visible features of an image such as edges, color, brightness, and curvature. Such approaches exploit specialized object properties to obtain satisfactory groupings, which can force those techniques to be domain specific. Furthermore, they do not provide a physical explanation for the image, nor do they group regions that have a single physical structure yet differing visible features. This paper presents a new approach to segmentation using explicit hypotheses about the physics that creates images. We propose an initial segmentation that identifies image regions exhibiting constant color, but possibly varying intensity. For each region, hypotheses are proposed that specifically model the illumination, reflectance, and shape of the 3-D patch which caused that region. An image region may have many hypotheses simultaneously, and each hypothesis represents a distinct, plausible explanation for the color and intensity variation of that patch. Hypotheses for adjacent patches can be compared for similarity and merged when appropriate, resulting in more global hypotheses for grouping elementary regions. This approach to segmentation has the potential to provide a list of possible explanations for a given image; to group together regions with coherent physical properties; and to provide a framework for applying specific operators such as shape-from-shading, color constancy, and roughness evaluation as part of the overall process of low-level vision. However, many profound unsolved problems are raised in determining the most plausible explanations for a given image region. In this paper, we present the approach, working through an example by hand, and discuss the implications of this approach for physics-based vision. DTIC

METHODS AND COMPONENTS FOR OPTICAL CONTENTION RESOLUTION IN HIGH SPEED NETWORKS Interim Report, 23 Feb. - 23 May 1994
Han Kim and Paul Melman 23 May 1994 15 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract MDA972-93-C-0057; ARPA Order 9339)
(AD-A280016) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

During the third quarter of the CORD project progress was made in the area of design and development of the various subunits of the system. Test and evaluation of the functional blocks built during the past quarter was the focus of the system group at Stanford University and the optoelectronics group at GTE Laboratories. Detailed Performance estimates were made with respect to signaling and its interference with the information channel. Progress was also made in the construction of the CRO module with detailed evaluation of the WDM components to be used and completion of the development of the high speed header detector module. Development of the logic control for CORD's contention resolution strategy was pursued further. Moreover, a 'Multi-Packet' CORD architecture was developed and shown that it can substantially reduce the packet loss probability. Logic control design was then provided also for this improved version of the CORD. DTIC

ANALOG PROCESSING OF OPTICAL WAVEFRONT USING INTEGRATED GUIDED-WAVE OPTICS Final Report, 1 Jun. 1990 - 31 Dec. 1993
Robert H. Rediker 30 Mar. 1994 55 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F49620-90-C-0036)
(AD-A279596; AFOSR-94-0306TR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Integrated Guided-Wave Optics has many advantages for the analog processing of optical wavefronts. These include small-size, high-speed, simplicity, reliability and reproducibility. The fabrication technique is similar to that of integrated circuits. The thrust of this program was to develop an integrated guide-wave optic system in GaAs and GaAlAs for use at GaAs laser wavelength, to remove aberrations from a laser beam and to steer the beam. The system would in addition have the capability to appropriately phase the outputs from a multiplicity of power amplifiers or injection locked lasers. It was also the intent of the program to design and build the optical circuits so they are compatible with on-chip electronic circuits in order to minimize the required number of off-chip leads. DEVELOPMENT, FABRICATION, AND METROLOGY OF THE ELECTRO-OPTICAL BREADBOARD MODEL FOR THE REFLECTION GRATING ARRAY OF THE XMM GRATING SPECTROMETER
T. A. Decker, R. C. Montesanti, J. V. Bixler, C. J. Hailey, and S. M. Kahn (California Univ., Berkeley, CA.) Jul. 1994 11 p Presented at the Annual Meeting of the Society of Photo-Optical Instrumentation Engineers, San Diego, CA, 24-29 Jul. 1994
(Contract W-7405-eng-48)
(DE94-016605; UCRL-JC-117808; CONF-940723-14) Avail: CASI HC A03/MF A01

A prototype array consisting of eight diffraction gratings has been fabricated for the XMM Reflection Grating Spectrometer. A component of the full spectrometer is an array of approximately 200 diffraction gratings. The diffraction gratings were produced using lightweight silicon carbide substrates and a replication technique. The prototype array was developed and assembled using the same tolerances as the flight arrays which have typical tolerances of 3 micrometers in translation and sub-arc seconds in rotation. The metrology applied during inspection and assembly included precision linear measurements, full aperture figure measurements, and angular interferometry. DOE

CONTROL OF CONTINUOUS PHASE PH USING VISIBLE LIGHT TO ACTIVATE PH-DEPENDENT FIBERS AND GELS IN A CONTROLLED AND REVERSIBLE MANNER Patent
Albert Zirino, inventor (to Navy) 2 Aug. 1994 11 p Filed 27 Aug. 1992
(AD-D016532; US-Patent-5,334,629; US-Patent-Appl-SN-936681; US-Patent-Class-523-137) Avail: US Patent and Trademark Office

A transparent polyelectrolyte fiber or gel, such as crosslinked polyacrylic acid, which contracts and expands upon the addition of an acid or base to an aqueous medium solution, is placed in the same solution with a pH dependent dye, a colored photochromatic indicator dye. The dye preferably has a pAa value that is the same as the pH at a null contraction point of the fiber. By irradiating the solution with light of a wavelength of the absorption band of either the acid or base form of the dye, the solution pH is made to change, and the fiber is made to expand or contract, depending upon the wavelength. Thus, light energy is readily converted to work energy and may be used to power a pump, for example or an artificial muscle can be powered via an optical fiber. DTIC

X-RAY MICROSCOPE FOR SOLIDIFICATION STUDIES Semiannual Report, 1 Mar. 1994 - 28 Feb. 1995
William Kaukler 28 Feb. 1995 6 p
(Contract NAS8-40185)
(NASA-CR-197375; NAS 1.26:197375) Avail: CASI HC A02/MF A01

This report covers the second 6 month period for the year March 1, 1994 to February 28, 1995. The material outlined in this semi-annual report continues from the previous semi-annual report. The Fein Focus Inc. x-ray source was delivered in September and coincides with the beginning of the second 6 month effort. As a result, and as outlined in the statement of work, this period was dedicated to the evaluation, testing and calibration of the x-ray source. In addition, in this period the modeling effort was continued and extended by the Tigêr series of Monte-Carlo simulation programs for photon and electron interactions with materials obtained from the Oak Ridge RISC Library. Some further calculations were also made with the absorption model. Author

This report summarizes the results of a 3-yr investigation into the role of light-scattering noise in nonlinear optical processes. These results span a full range - from physical and mathematical description and prediction of noise properties to experimental verification of the theory and interpretation of measurements. Light-scattering noise fluctuations are shown to set fundamental limits on device size and sensitivity and on beam power requirements for nonlinear optical processes. DTIC

The utility of organic salts related to 4-Dimethylamino-N-methyl Stilbazolium Tosylate, DAST, to display very useful optoelectronic properties has been broadly investigated and continues to yield new information. New materials have been developed having improved optical and physical properties. Methods for crystal growth and handling have been developed which allow the design and fabrication of useful optoelectronic devices. Design and fabrication of a linear array of high performance Fabry-Perot etalons is described. DTIC

S-D HYBRIDIZATION AND ANISOTROPY OF THE OPTICAL SECOND HARMONIC AT LOW FREQUENCIES Technical Report, Jun. 1993 - May 1994
Paul E. Bunson, Roger Haydock, and G. L. Richmond 13 May 1994 18 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-89-J-1261)
(AD-A279449; TR-10) Avail: CASI HC A03

Recent experiments show that the anisotropy of the optical second harmonic (SHG) response from noble metal surfaces persists at frequencies below those associated with interband transitions and plasma resonances. It is proposed that for noble metals this anisotropy is a consequence of the hybridization between s and d-orbitals. By taking advantage of a moment expansion and related path counting methods, the relative importance of the different contributions to SHG can be identified. To illustrate this result, the nonlinear polarizations are calculated using the recursion method. DTIC

PASSIVE RANGE MEASUREMENT SYSTEM Patent Application
Walter L. Harriman, inventor (to Navy) 27 Jul. 1992 14 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-D016222; US-Patent-Appl-SN-921863) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

A method and apparatus provides instantaneous passive range measurement onboard an aircraft for determining the range between the aircraft and a target. The target may either be stationary and on the earth's surface, or a slower moving vehicle. Calculation of the desired range is achieved using the formula: Range = (Sin a/Sin b) V; where 'a' = angle from aircraft heading to target, 'b' = turning rate; and 'V' ground velocity. The apparatus consists of an automatic video tracker, a video camera, and a servo controlled aiming platform. A resolver on the aiming platform is utilized to determine the angle from the aircraft axis to the target. This angle is added to the aircraft drift angle to determine the total angle from the aircraft heading to the target. The video tracker is utilized to determine the turning rate of the aiming platform. Using the difference in contrast between the target and the background of the video scene, the tracker provides error signals (azimuth and elevation) to keep the aiming platform pointed at the target. MAGNETOELECTRIC PROPERTIES OF RECIPROCAL BIANISOTROPIC MATERIALS WITH FOCUS ON THE POLARIZABILITY OF CHIRO-OMEGA SPHERES
Ari H. Sihvola and Ismo V. Lindell May 1994 25 p
(ISSN 0784-848X)
(PB95-127650; ISBN-951-22-2129-2) Avail: CASI HC A03/MF A01

The paper concentrates on magnetoelectric characteristics of bianisotropic materials using the concept of reciprocity as a criterion of classification. A dyadic matrix representation is followed, and the complementary operation for dyadic matrices is introduced which is shown to be a very useful operation in treating material parameters of bianisotropic media. The analysis goes further to treat the polarizability properties of bianisotropic spheres. The polarizability matrix, containing four dyadic elements, is derived in compact matrix form. The distinction between two types of reciprocal magnetoelectric coupling is interpreted in terms of helical and omega-type elements. These account for the symmetric and antisymmetric parts, respectively, of the magnetoelectric material dyadic in the bianisotropic relations. The components of the polarizability dyadics are calculated for an omega sphere and also for a chiro-omega sphere. It is found that the components of the material parameter dyadics become coupled in the polarizability components. The coupling details are described and these are shown to be different for the chiral magnetoelectric effects and the omega effects. NTIS

NONLINEAR FREQUENCY CONVERSION OPTICAL FILTER Patent
Bruce P. Boczar, inventor (to Navy) 16 Aug. 1994 7 p Filed 20 Sep. 1993 Supersedes AD-D016127
(AD-D016523; US-Patent-5,339,189; US-Patent-Appl-SN-123959; US-Patent-Class-359-326) Avail: US Patent and Trademark Office

The present invention is a method and system for performing optical filtering. Light energy in one frequency band is received in this system. The received light energy is filtered in one frequency band in order to provide filtered light which is applied to a nonlinear optical device. The nonlinear optical device provides frequency conversion preferably by forming a sum frequency or difference frequency. The frequency converted light energy is in a second frequency band. The energy in this second frequency band is applied to a further filter in a different frequency band wherein the two filter frequency bands are selected to prevent light energy from passing through both filters. The received light energy may contain information which is recoverable from the light energy which passes through the second filter. The nonlinear device is a crystal in which the index of refraction may be changed in order to tune the filter. DTIC

METHOD FOR CHARACTERIZATION OF OPTICAL WAVEGUIDE DEVICES USING PARTIAL COHERENCE INTERFEROMETRY Patent
Matthew N. McLandrich, inventor (to Navy), Donald J. Albares, inventor (to

Navy), and Stephen A. Pappert, inventor (to Navy) 23 Aug. 1994 28 p Filed 15 Jan. 1991
(AD-D016525; US-Patent-5,341,205; US-Patent-Appl-SN-643385; US-Patent-Class-356-73) Avail: US Patent and Trademark Office

An optical system and method includes a short coherence length edge, emitting LED, a fiber optic coupler probe, and a Michelson interferometer to measure the parameter of thickness of optical devices, such as thin silicon substrate samples and to characterize other parameters of optical waveguide devices such as absolute attenuation, effective refractive index, and changes in these parameters with the application of a modulation voltage or an external disturbance. The measurable thickness range from a few to hundreds of microns with a thickness precision exceeding 0.1 micron for a 10 micron sample. In situ localized measurements of samples in an etching chamber are obtainable to control processing and provide for thickness uniformity. DTIC

FIBER-OPTIC SENSORS FOR RAPID, INEXPENSIVE CHARACTERIZATION OF SOIL AND GROUND WATER CONTAMINATION
Fred P. Milanovich and Jesse L. Yow, Jr. Aug. 1994 7 p Presented at the Conference and Exposition on Petroleum Hydrocarbons, Houston, TX, 2-4 Nov. 1994
(Contract W-7405-eng-48)
(DE95-002471; UCRL-JC-118432; CONF-941152-1) Avail: CASI HC A02/MF A01

The extent and complexity of worldwide environmental contamination are great enough that characterization, remediation, and performance monitoring will be extremely costly and lengthy. Characterization techniques that are rapid, inexpensive, and simple and that do not generate waste are urgently needed. Towards this end LLNL is developing a fiber-optic chemical sensor technology for use in groundwater and vadose-zone monitoring. We use a colorimetric detection technique, based on an irreversible chemical reaction between a specific reagent and the target compound. The accuracy and sensitivity of the sensor (less than 5 ppb by weight in water, determined by comparison with gas chromatographic standard measurements) are sufficient for environmental monitoring of trichloroethylene (TCE) and chloroform. LIGHT OUTPUT AND RADIATION DAMAGE IN A YAlO3:Ce CRYSTAL
J. A. Kierstead, S. P. Stoll, and C. L. Woody 1994 5 p Presented at the Spring Meeting of the Materials Research Society, San Francisco, CA, 4-8 Apr. 1994
(Contract DE-AC02-76CH-00016)
(DE94-016815; BNL-60592; CONF-940411-47) Avail: CASI HC A01/MF A01

The optical absorption, light output, and effects of radiation damage have been studied in a 2.1 x 2.1 x 2.1 cm(exp 3) crystal of YAlO3:Ce. The light yield produces approximately 2867 photoelectrons per MeV on a photomultiplier tube with a bialkali photocathode. The scintillation and light transmission properties of the crystal were characterized before and after exposure to 1 Mrad of Co-60 gamma rays. Significant radiation induced optical absorption was observed near the optical band edge of the crystal, along with an extremely intense phosphorescence after irradiation. Partial spontaneous recovery from the damage occurred at room temperature, and it was possible to induce additional recovery by optical bleaching. DOE

FIBER-OPTIC ROTARY JOINT WITH BUNDLE COLLIMATOR ASSEMBLIES Patent Application
Gregory H. Ames, inventor 8 Aug. 1994 15 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-D016504; US-Patent-Appl-SN-287027) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

There is presented a fiber-optic rotary joint with first and second bundle collimator assemblies, the joint comprising a generally cup-shaped main rotor, a first bundle collimator assembly fixed in a central opening in a bottom wall of the main rotor, a generally cup-shaped stator disposed within the main rotor, the stator having a bottom wall opposed to the main rotor bottom wall, and a second bundle collimator assembly disposed in a central opening in the bottom wall of the stator. The joint further includes a prism mounted in a prism rotor in the joint between the first and second collimator assemblies, and gear means for causing rotation of the main rotor at twice the speed of rotation of the prism rotor. Azimuthal adjustment structure is disposed on one of the first and second collimator assemblies for azimuthal alignment of the one collimator assembly with the other of the collimator assemblies. HIGH FREQUENCY CURRENT SENSORS USING THE FARADAY EFFECT IN OPTICAL FIBERS
R. W. Cernosek Sep. 1994 239 p
(Contract DE-AC04-94AL-85000)
(DE95-001859; SAND-94-2572) Avail: CASI HC A11/MF A03

This study investigates the high frequency response of Faraday effect optical fiber current sensors that are bandwidth-limited by the transit time of the light in the fiber. Mathematical models were developed for several configurations of planar (collocated turns) and travelling wave (helical turns) singlemode fiber sensor coils, and experimental measurements verified the model predictions. High frequency operation above 500 MHz, with good sensitivity, was demonstrated for several current sensors; this frequency region was not previously considered accessible by fiber devices. Planar fiber coils in three configurations were investigated: circular cross section with the conductor centered coaxially; circular cross section with the conductor noncentered; and noncircular cross section with arbitrary location of the conductor. The helical travelling wave fiber coils were immersed in the dielectric of a coaxial transmission line to improve velocity phase matching between the field and light. Three liquids (propanol, methanol, and water) and air were used as transmission line dielectric. Complete models, which must account for liquid dispersion and waveguide dispersion from the multilayer dielectric in the transmission line, were developed to describe the Faraday response of the travelling wave sensors. Other travelling wave current sensors with potentially greater Faraday sensitivity, wider bandwidth and smaller size are investigated using the theoretical models developed for the singlemode fibers coils. HIGH RESOLUTION DESCRIPTIONS OF IRAS 12 AND 25 MICRONS CONFUSED REGIONS Final Report, 9 Jan. 1990 - 30 Sep. 1993
R. M. Kennealy, R. S. Sample, J. P. Kennealy, R. A. Gonsalves (Tufts

Univ., Medford, MA.), and R. Canterna (Wyoming Univ., Laramie, WY.) Apr. 1994 136 p
(Contract F19628-90-C-0110; AF Proj. 7670)
(AD-A285847; PL-TR-94-2197; AD-E202172) Avail: CASI HC A07/MF A02

12 and 25 micron IRAS Survey and AO footprint scan data in the galactic plane have been reprocessed as images for 2-dimensional point source extractions in an effort to provide a point source catalog supplement which is more complete than the IRAS PSC in the regions labeled 'confused' by IRAS. Approximately 3500 square degrees of sky are available as an atlas of high resolution galactic plane images (14.4 in.) pixels. For each region of the sky, there are separate background and point source images. Point source extraction results indicate that the 2-D processing improves completeness over the PSC everywhere in the plane, and increases source counts by a factor of 2-4 over the PSC. DTIC

A COMPUTER-BASED MULTIMEDIA PROTOTYPE FOR NIGHT VISION GOGGLES M.S. Thesis
Bobby Bryant and Glenroy E. Day, Jr. Sep. 1994 44 p
(AD-A286208) Avail: CASI HC A03/MF A01

Naval aviators who employ night vision goggles (NVG) face additional risks during nighttime operations. In an effort to reduce these risks, increased training with NVG's is suggested. Our goal was to design a computer-based, interactive multimedia system that would assist in the training of pilots who use NVG's. This thesis details the methods and techniques used in the development of the NVG multimedia prototype. It describes which hardware components and software applications were utilized as well as how the prototype was developed. Several facets of multimedia technology (sound, animation, video, and three dimensional graphics) have been incorporated into the interactive prototype. For a more robust successive prototype, recommendations are submitted for future enhancements that include alternative methodologies as well as expanded interactions. DTIC

TECHNIQUE FOR INTRACAVITY SUM FREQUENCY GENERATION Patent
Richard Scheps, inventor (to Navy) 26 Jul. 1994 16 p Filed 12 Aug. 1993
(AD-D016478; US-Patent-5,333,142; US-Patent-Appl-SN-108131; US-Patent-Class-372-22) Avail: US Patent and Trademark Office

A means for intracavity sum frequency generation is described in which a laser operates simultaneously at two wavelengths. The laser resonator further contains a sum frequency generating nonlinear crystal which is oriented for efficient sum frequency generation of the two fundamental wavelengths. The optical alignment of the resonator provides a region where both fundamental wavelengths are overlapped and are focused. The nonlinear sum frequency generating crystal is placed near this focus in the region where both wavelengths are spatially superimposed, producing the sum frequency of the two wavelengths. Line narrowing of the individual two fundamental wavelengths produces a line narrowed sum frequency generated output. Mirror coatings on all reflective elements are highly reflective for both fundamental wavelengths to produce a high intracavity fluence at both of these frequencies. Sum frequency generation at 459 nm is demonstrated in a non-critically phase matched type II KTP crystal by operating a Ti:sapphire laser simultaneously at 808 nm and 1.064 microns. In order to achieve simultaneous operation at both wavelengths a 1.064 microns signal may be injected into the resonator from an external source, such as a Nd:YAG laser. A doubled Nd:YAG laser may be used to optically excite the Ti:sapphire laser while simultaneously injecting 1.064 microns radiation into the laser cavity. DTIC

SUBMICROSECOND, SYNCHRONIZABLE X-RAY SOURCE Patent
Robert R. Whitlock, inventor (to Navy) 2 Aug. 1994 7 p Filed 31 Mar. 1993
(AD-D016497; US-Patent-5,335,258; US-Patent-Appl-SN-041388; US-Patent-Class-378-122) Avail: US Patent and Trademark Office

In the submicrosecond, synchronizable x-ray source a high intensity pulsed laser is focused onto a negatively biased laser target, at high irradiance in a vacuum, producing high temperature plasma from which electrons are emitted. The emitted electrons are accelerated in a electric field formed by impressing a potential difference across a laser target-electron target gap. The positively biased electron target collects the emitted electrons, which upon impact with the electron target cause x-rays to be emitted synchronously with the incident laser pulse. DTIC

THE OPTICAL PROPERTIES OF PARTICLES DEPOSITED ON A SURFACE Final Report
F. Borghese Sep. 1994 29 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DAJA45-93-C-0043)
(AD-A286258; R/D-7130-EN-09) Avail: CASI HC A03

In recent years the optical properties of particles near or on a plane surface have been the subject of several papers that deal with both the theoretical and the experimental aspects of the problem. This interest from the scientific community can be easily understood because revealing through optical measurements the presence of particles on a surface that is expected to be clean is of great importance both for industry and for medicine. Among the theoretical techniques that have been proposed to deal with the problem the method of the images proved to be the most fruitful when the plane surface is a perfectly reflecting one, a condition that is met to a high degree of accuracy by many polished metallic surfaces. According to the theory of the images the problem of scattering from a particle in the vicinity of a perfectly reflecting plane surface is quite equivalent to the problem of the dependent scattering from the compound object that is composed by the actual particle and by its mirror image when excited by the superposition of the fields that come from the actual source and from its image. Of course, the method of the images is advantageous provided one is able to solve, without undue computational effort, the problem of scattering from the compound scatterer. In fact, the lack of an efficient technique to deal with this problem forced several researchers to solve the problem for limiting cases only, e. g. normal incidence, or through approximations, such as the assumption of smallness of the scattering particle. CHARACTERIZATION EQUIPMENT FOR ELECTROOPTICS AND ACTUATORS Final Report, 30 Sep. 1993 - 30 Sep. 1994

Gene Haertling, Eugene Furman, and Feiling Wang 17 Oct. 1994 5 p
(Contract N00014-93-1-1129)
(AD-A286285) Avail: CASI HC A01/MF A01

The goal of the ONR sponsored grant is to enhance the characterization capabilities of the Electroceramic Group in the Ceramics Department of Clemson University in the areas of electrooptics and electromechanical actuators. These are core research areas, so the instrumentation acquired through this grant benefits the majority of current research projects. This report summarizes research which directly benefits from the acquired instrumentation. The new equipment strengthens dielectric, piezoelectric, and electrooptic characterization capabilities for both thin film and bulk devices. Dielectric and piezoelectric characterization of materials is especially useful in current studies of actuator devices such as Rainbow devices. Electrooptic characterization equipment is used mainly to study transparent PLZT thin film ceramics. DTIC

FACTORS AFFECTING THE PERCEPTION OF LUNING IN MONOCULAR REGIONS OF PARTIAL BINOCULAR OVERLAP DISPLAYS
Victor Klymenko, Robert W. Verona, John S. Martin, Howard H. Beasley, and William E. McLean Aug. 1994 54 p
(DA Proj. 3E1-62787-A-879)
(AD-A286287; USAARL-94-47) Avail: CASI HC A04/MF A01

Luning is a detrimental visual effect characterized by a subjective darkening of the visual field in the monocular regions of partial binocular overlap displays. The effect of a number of factors on the magnitude of luning was investigated. These factors include: (1) the convergent versus the divergent display modes for presenting a partial binocular overlapping field-of-view; (2) the display luminance level; (3) the placement of either black or white contours versus no (null) contours on the binocular overlap border; and (4) the increasing or decreasing of the luminance of the monocular side regions relative to the binocular overlap region. Eighteen Army student aviators served as subjects in a repeated measures design. The percentage of time luning was seen was the measure of the degree of luning. The results indicated that the divergent display mode systematically induced more luning than the convergent display mode under the null contour condition. Adding black contours reduced luning in both the convergent and divergent display modes, where the convergent mode retained its relatively lower magnitude of luning. The display luminance level had no effect on luning for the null or black contour conditions. DTIC

APPLICATION OF OPTICAL SECOND HARMONIC GENERATION TO SURFACE ANALYSIS Technical Report, Jun. 1993 - May 1994
G. L. Richmond 13 May 1994 6 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-89-J-1261)
(AD-A279445; TR-12) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Understanding surface and interfacial properties remains a challenging task, particularly when these interfacial regions are under relatively reactive conditions. This is particularly true of semiconductor surfaces which can be highly reactive under ambient or processing conditions. One of the studies to be described in this presentation is our recent work on Si electrode surfaces. In recent years significant progress has been made in characterizing the Si/electrolyte interface by infrared reflectance, ultra-high vacuum UHV transfer experiments, and scanning tunneling microscopy STM and AFM imaging. These studies have taken advantage of the relative stability of Si surface prepared in a hydrogen terminated state. The more usual form in either air or in water is a heavily oxidized Si surface for which much less is known because of the inapplicability of many of the above techniques to examining the Si/SiO2 interfacial region. The presence of the oxide can significantly alter the electrochemistry and the electronic properties of the semiconductor. In this paper we discuss our application of optical second harmonic generation (SHG) to studying the Si/electrolyte and Si/SiO2/electrolyte interfaces for which oxides have been photoanalytically grown on the surface. OPTICAL FIBER PRESSURE SENSOR FOR LIQUID LEVEL MONITORING Patent Application
Frank Cuomo, inventor (to Navy) 22 Feb. 1994 14 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-D016246; US-Patent-Appl-SN-199868) Avail: CASI HC A03

An apparatus for continuously monitoring changes in a liquid level in accordance with a differential pressure is provided. A sensor body immersed in the liquid supports two thin-filmed metallic diaphragms that are independently, axially responsive to pressure of the liquid. Each diaphragm has a different modulus of elasticity. Two fiber optic pressure sensors are mounted within an air space encased by the sensor body in combination with the two diaphragms. Each of the two fiber optic pressure sensors detects the axial response of one of the two diaphragms. The displacement difference between the two diaphragms is an indication of differential pressure related to the liquid level. DTIC

EMBEDDED OPTICAL FIBRES AS STRAIN SENSORS IN POLYMER MATRIX FIBRE COMPOSITES: THE INFLUENCE OF ADHESION IN STRAIN TRANSFER |INBAEDDADE OPTISKA FIBRER SOM TOEJNINGSSENSORER I POLYMERBASERADE FIBERKOMPOSITER: VIDHAEFTNINGENS INVERKAN PA TOEJNINGSOEVERFOERINGEN|
M. Ekroth Jun. 1994 34 p In SWAHILI
(PB95-133617; FOA-C-20983-2.4) Avail: Issuing Activity (National Technical Information Service (NTIS))

Optical fibers can serve as strain sensors embedded in load carrying polymer matrix fiber composites. The aim of the study was to investigate the influence of chemical bonding between the optical fiber, its protective polyimide coating and the surrounding composite, in strain transfer from the composite to the optical fiber. The degree of adhesion was determined by measuring the force during debonding and pull-out of the optical fiber from the composite. Debonding occurred between the quartz fiber and the coating for both untreated and ammonia modified fibers. The PTFE coated fibers debonded between the coating and the composite. The modified fibers debonded at a lower applied load than the untreated fibers. The strain during tensile loading was measured both with conventional resistance strain gages mounted on the specimen surfaces, and optically with a Mach-Zehnder-interferometer. The optically measured strains, obtained with the untreated fiber and the modified fibers, were all in good agreement with the response from the resistance strain gages. It is concluded that the chemical bonding between the quartz fiber/coating/composite consequently has little or no influence on the strain transfer. Internal stresses (mechanical pressure and friction forces) arising from the laminate fabrication process are sufficient for strain transfer. NTIS

(AD-A286416; RL-TR-94-185) Avail: CASI HC A03

Diffractive optical element designs are presented for a free-space focused optical interconnect whereby a 4x4 array of LED's is focused onto a 4x4 array of photodetectors. Process development for highly efficient diffractive elements is presented. Fabrication tolerances for binary level alignment and etch depth are determined. Eight-level diffractive elements are fabricated using electron beam lithography and reactive ion etching. Continuously graded gratings are fabricated using focused ion beam milling. Device fabrication is characterized by scanning electron microscopy and atomic force microscopy, and device performance is determined by measuring diffraction efficiencies. DTIC

A two-dimensional opto-electronic diffraction grating based on PLZT ceramic material for optical switching and reconfigurable optical interconnect applications is demonstrated. Integratable chips are fabricated consisting of numerous fine interleaved transparent indium-tin oxide (ITO) electrodes on a polycrystalline PLZT ceramic substrate. The chips measure one centimeter square. The electrode features are scaled and measure from 12.5 micrometers to 100 micrometers. Reported here are chip material and fabrication details. DTIC

ELECTRO-OPTIC EFFECT IN THE PESO ACOUSTO-OPTIC MODULATOR
Renzhong Tai, Futun Lu, Shuzhong Yuan, Xin-An Guan, and Bing Li 9 Nov. 1994 15 p Transl. into ENGLISH from Wuli Xuebao (China), v. 41, no. 6, Jun. 1992 p 1012-1018
(AD-A286355; NAIC-ID(RS)T-0395-94) Avail: CASI HC A03/MF A01

With the theory of one-dimensional approximation, combined with the boundary conditions, an inhomogeneous electric field is derived from the fundamental equations of piezoelectric effect. This inhomogeneous electric field will lead to generation of electric grating, and high-order grating can also appear owing to coupling between electric grating and acoustic grating. Linear electro-optics effect in PESO modulator is helpful to the diffraction and modulation of the incident light beam. The experimental results verify our conclusions. Author (DTIC)

(DE94-631422; ANU-PRL-TP-93/01) Avail: CASI HC A03/MF A01 (US Sales Only)

The global asymptotic matching equations for multiple coupled resistive modes of arbitrary parity in a cylindrical plasma are derived. Three different variational principles are given for the outer region matching data, while the inner-region analysis features a careful treatment of the symmetry-breaking effect of a gradient in the equilibrium current for a zero-(beta) slab model. It is concluded that the usual constant-(psi) result remains valid and constrains the matrix matching formalism. The dispersion relation is compared with initial value calculations of a double tearing mode when there are small relative rotation velocities between the rational surfaces. In treating differential rotation within the asymptotic matching formalism, flow is ignored in the outer region and is assumed to affect the inner response solely through a Doppler shift. It is shown that the relative rotation can have a strong stabilizing effect by making all but one rational surface effectively ideal. DOE

(DE94-018653; SAIC-94/1098; DOE/ER-54124/1) Avail: CASI HC A04/MF A01

In this document the author describes an extension of the spatial gridding techniques to an MHD model suitable for the description of the dynamics of toroidal fusion devices. Since the dominant MHD modes in these devices have relatively long toroidal wavelength, the toroidal coordinate is approximated with finite Fourier series. The unstructured, triangular mesh is used to describe the details of the poloidal geometry. With some exceptions, the hydrodynamic variables are treated in a manner analogous to that used in CFD. These quantities (mass, energy, and momentum) are volume based densities that satisfy scalar or vector conservation laws. The electromagnetic variables (the magnetic flux density B and the electric current density J) are area based densities that satisfy pseudo-vector conservation laws, and have no counterpart in fluid dynamics. These variables are also constrained to remain solenoidal. These quantities are represented on the triangular mesh in a new manner that is an extension of that used on rectangular, structured meshes. In this work the author has chosen to solve the primitive MHD equations in order to make the resulting codes and techniques more generally applicable to problems beyond the narrow scope of tokamak plasmas. The temporal stiffness problems inherent in this description of tokamak dynamics that motivate the reduced MHD model are addressed here with the semi-implicit method of time integration. Finally, the author remarks that, while the present work deals strictly with the MHD equations, other volume based fluid descriptions, such as diffusive transport could easily be adapted to these techniques and coupled with the description of the electromagnetic field presented here. A design strategy for an integrated shaping and stability control algorithm for ITER is described. This strategy exploits the natural multivariable nature of the system so that all poloidal field coils are used to simultaneously control all regulated plasma shape and position parameters. A nonrigid, flux-conserving linearized plasma response model is derived using a variational procedure analogous to the ideal MHD Extended Energy Principle. Initial results are presented for the non-rigid plasma response model approach applied to an example DIII-D equilibrium. For this example, the nonrigid model is found to yield a higher passive growth rate than a rigid current-conserving plasma response model. Multivariable robust controller design methods are discussed and shown to be appropriate for the ITER shape control problem. DOE

This report summarizes the progress on the pulsed power approach to inertial confinement fusion. In 1989, the authors achieved a proton focal intensity of 5 TW/sq cm on PBFA-2 in a 15-cm-radius applied magnetic-field (applied-B) ion diode. This is an improvement by a factor of 4 compared to previous PBFA-2 experiments. They completed development of the three-dimensional (3-D), electromagnetic, particle-in-cell code QUICKSILVER and obtained the first 3-D simulations of an applied-B ion diode. The simulations, together with analytic theory, suggest that control of electromagnetic instabilities could reduce ion divergence. In experiments using a lithium fluoride source, they delivered 26 kJ of lithium energy to the diode axis. Rutherford-scattered ion diagnostics have been developed and tested using a conical foil located inside the diode. They can now obtain energy density profiles by using range filters and recording ion images on nuclear track recording film. Timing uncertainties in power flow experiments on PBFA-2 have been reduced by a factor of 5. They are investigating three plasma opening switches that use magnetic fields to control and confine the injected plasma. These new switches provide better power flow than the standard plasma erosion switch. Advanced pulsed-power fusion drivers will require extraction-geometry applied-B ion diodes. During this reporting period, progress was made in evaluating the generation, transport, and focus of multiple ion beams in an extraction geometry and in assessing the probable damage to a target chamber first wall. ANALYSIS METHODS FOR FAST IMPURITY ION DYNAMICS DATA
D. J. DenHartog, A. F. Almagri, S. C. Prager, and R. J. Fonck Aug. 1994 13 p Presented at the 10th Topical Conference on High-Temperature Plasma Diagnostics, Rochester, NY, 8-12 May 1994
(Contract DE-FG02-85ER-53198)
(DE95-000589; DOE/ER-53198/248; CONF-940552-32) Avail: CASI HC A03/MF A01

A high resolution spectrometer has been developed and used on the MST reversed-field pinch (RFP) to measure passively impurity ion temperatures and flow velocities with 10 (mu)s temporal resolution. Such measurements of MHD-scale fluctuations are particularly relevant in the RFP because the flow velocity fluctuation induced transport of current (the 'MHD dynamo') may produce the magnetic field reversal characteristic of an RFP. This instrument will also be used to measure rapid changes in the equilibrium flow velocity, such as occur during locking and H-mode transition. The precision of measurements made to date is less than 0.6 km/s. The authors are developing accurate analysis techniques appropriate to the reduction of this fast ion dynamics data. Moment analysis and curve-fitting routines have been evaluated for noise sensitivity and robustness. Also presented is an analysis method which correctly separates the flux-surface average of the correlated fluctuations in u and B from the fluctuations due to rigid shifts of the plasma column. DOE

FLUCTUATIONS AND TRANSPORT IN THE REVERSED FIELD PINCH: CHARACTERIZATION AND REDUCTION
J. S. Sarff, A. F. Almagri, J. D. Callen, M. Cekic, B. E. Chapman, N. Crocker, D. J. DenHartog, E. Fernandez, G. Fiksel, and R. W. Harvey (General Atomics Co., San Diego, CA.) et al Sep. 1994 11 p Presented at the 15th International Conference on Plasma Physics and Controlled Nuclear Fusion Research, Seville, Spain, 26 Sep. - 1 Oct. 1994
(Contract DE-FG02-85ER-53198)
(DE95-000590; DOE/ER-53198/249; IAEA-CN-60/C-1-I-5; CONF-940933-4) Avail: CASI HC A03/MF A01

Reduction via current profile control of the low frequency, resonant, tearing mode fluctuations responsible for the stochastic magnetic field in the core of the RFP has been demonstrated in MST using auxiliary inductive current drive. In making this reduction, sawteeth are stabilized, and the energy confinement time doubles. To enhance and maintain current profile control and improved confinement, non-inductive current drive is required. Analytical and numerical studies indicate that electrostatic and RF current drive can stabilize the tearing fluctuations. Experiments to test such methods are in preparation on MST. In a second key area relating to RFP confinement, recent theoretical initiatives have found that, in the presence of tearing fluctuations, the growth rates and mode widths of short wavelength turbulence increases. If such turbulence governs transport at the edge of the RFP, then reduction of tearing modes may improve edge confinement as well. DOE

Probe measurements in MST indicate that RFP particle and energy loss is governed by magnetic fluctuations inside r/a = 0.8, with energy carried out convectively by superthermal electrons. The radial loss rate is lower than the Rechester-Rosenbluth level, presumably due to the establishment of a restraining ambipolar potential. Several aspects of these measurements contradict the Kinetic Dynamo Theory, while the MHD dynamo EMF is measured to be large enough to drive the edge current carried by these superthermal electrons. ALT-2 ARMOR TILE DESIGN FOR UPGRADED TEXTOR OPERATION
B. L. Newberry (Michigan Univ., Ann Arbor, MI.), R. T. McGrath, R. D. Watson, W. Kohlhaas (Kernforschungsanlage, Juelich, Germany.), and K. H. Finken (Kernforschungsanlage, Juelich, Germany.) 1994 16 p Presented at the ISFNT-3: 3rd International Symposium on Fusion Nuclear Technology, Los Angeles, CA, 27 Jun. - 1 Jul. 1994
(Contract DE-AC04-94AL-85000)
(DE94-015749; SAND-94-1769C; CONF-940664-21) Avail: CASI HC A03/MF A01

The upgrade of the TEXTOR tokamak at KFA Juelich was recently completed. This upgrade extended the TEXTOR pulse length from 5 seconds

to 10 seconds. The auxiliary heating was increased to a total of 8.0 MW through a combination of neutral beam injection and radio frequency heating. Originally, the inertially cooled armor tiles of the full toroidal belt Advanced Limiter Test-2 (ALT-2) were designed for a 5-second operation with total heating of 6.0 MW. The upgrade of TEXTOR will increase the energy deposited per pulse onto the ALT-2 by abo ut 300%. Consequently, the graphite armor tiles for the ALT-2 had to be redesigned to avoid excessively high graphite armor surface temperatures that would lead to unacceptable contamination of the plasma. This redesign took the form of two major changes in the ALT-2 armor tile geometry. The first design change was an increase of the armor tile thermal mass, primarily by increasing the radial thickness of each tile from 17 mm to 20 mm. This increase in the radial tile dimension reduces the overall pumping efficiency of the ALT-2 pump limiter by about 30%. The reduction in exhaust efficiency is unfortunate, but could be avoided only by active cooling of the ALT-2 armor tiles. The active cooling option was too complicated and expensive to be considered at this time. The second design change involved redefining the plasma facing surface of each armor tile in order to fully utilize the entire surface area. The incident charged particle heat flux was distributed uniformly over the armor tile surfaces by carefully matching the radial, poloidal and toroidal curvature of each tile to the plasma flow in the TEXTOR boundary layer. This geometry redefinition complicates the manufacturing of the armor tiles, but results in significant thermal performance gains. In addition to these geometry upgrades, several material options were analyzed and evaluated.

Meyer (Lawrence Livermore National Lab., Livermore, CA.) et al Jul. 1994 4 p Presented at the European Conference on Controlled Fusion and Plasma Physics, Montpellier, France, 27 Jun. - 1 Jul. 1994 Submitted for publication
(Contracts DE-AC03-89ER-51114; W-7405-eng-48; GA Proj. 3466)
(DE94-017510; GA-A-21750; CONF-940635-10) Avail: CASI HC A01/MF A01

In our investigation of improved confinement in high poloidal beta (beta(sub p)= 2 to 4) advanced tokamak experiments, we observe that the internal MHD activity evolves from an m/n = 2/1 to a 3/1 structure coincident with q(sub o) rising above 2, and consistent with the GATO code stability analysis. The plasma eventually evolves to a quiescent state at which time the stored energy increases, mostly as a result of improved particle confinement. The bootstrap fraction rises to 80%. The measured plasma pressure profiles during this time are calculated to be stable to high-n ballooning modes consistent with operation of the core in the second stable regime. The sustained improvement in confinement is ultimately limited by our ability to control the toroidal current profile. DOE

(Contract W-7405-eng-48)
(DE94-016542; UCRL-ID-117344) Avail: CASI HC A03/MF A01

As part of the Conceptual Design Report (CDR) for the National Ignition Facility (NIF), scientists from Lawrence Livermore National Laboratory (LLNL), Los Alamos National Laboratory (LANL), Sandia National Laboratory (SNL), the University of Rochester's Laboratory for Laser Energetics (UR/LLE), and EG&G formed an NIF Target Diagnostics Working Group. The purpose of the Target Diagnostics Working Group is to prepare conceptual designs of target diagnostics for inclusion in the facility CDR and to determine how these specifications impact the CDR. To accomplish this, a subgroup has directed its efforts at constructing an approximate experimental plan for the ignition campaign of the NIF CDR. The results of this effort are contained in this document, the Experimental Plan for achieving fusion ignition in the NIF. This group initially concentrated on the flow-down requirements of the experimental campaign leading to ignition, which will dominate the initial efforts of the NIF. It is envisaged, however, that before ignition, there will be parallel campaigns supporting weapons physics, weapons effects, and other research. This plan was developed by analyzing the sequence of activities required to finally fire the laser at the level of power and precision necessary to achieve the conditions of an ignition hohlraum target, and to then use our experience in activating and running Nova experiments to estimate the rate of completing these activities.

The hardening of instruments to survive NIF target emission environments presents a significant challenge. Neutron flux is predicted to be as much as six orders of magnitude greater than the highest achieved neutron flux on NOVA. Not withstanding the high prompt radiation fields, the specifications for the instruments are demanding; requiring high resolution imaging and sub nanosecond transient measurements. We present an analysis of the sensitivity of the proposed NIF instrumentation design to EMP, X-rays, gamma rays, and neutrons. Major components assessed include fiber optic cable transport, high bandwidth cable and charge coupled detector (CCD) imaging systems. DOE

THE CONTROL SYSTEM POSITION TO THE ELECTRIC PROBE IN THE TOKAMAK NOVILLO Ph.D. Thesis [CONTROL DE POSICION DE LA SONDA ELECTRICA EN EL TOKAMAK NOVILLO]
A. M. SanchezGarcia 1993 112 p In SPANISH
(DE94-629938; MFIS-mf-13922) Avail: CASI HC A06/MF A02 (US Sales Only)

An electric probe is used to determine the parameters of electronic temperatures, the electron density and the plasma potential in Tokamak machines. On this machine the electric probes are used only in the plasma edge due to the intensive flow of high energy particles. This is the region in which the plasma density and temperature are relatively low. This work shows the design and construction of an electro mechanic system which is used to control the position of the probe into the discharge chamber. This system is called 'The control system position to the electric probe in the tokamak Novillo'. This controller is a minimum system to rule a step motor by a logic sequence commutation. This is done by sliding the probe in a radial way with millimetric precision into the discharge chamber. To this purpose it is used as step motor, due to its principal characteristic as the control of the end element position without needing a feedback of the error signal. The system function consists of reading, through a board, the data corresponding to the position where it is wanted to place the probe; it also displays by a numeric indicator the position in which the probe is located (in an interval from 0 to 100 mm), and provides the logic sequence commutation for the step motor. The minimum system is consists of the microcontroller 8748-8 that gives precision control of the electric probe position in the Tokamak Novillo, by programming, associated circuits, amplification unit bi-phase unipolar and switching power (they supply the power to the control circuit and to the step motor too), avoiding the destruction of the electric probe. Experiments to explore the interaction of Ion Cyclotron Range of Frequencies (ICRF) heating with the edge plasmas on the Tore Supra tokamak have been undertaken. The actively cooled, lateral protection (bumper limiters) on the three ICRF antennas in Tore Supra can experience overheating for power levels greater than 2 MW per antenna and pulse lengths greater than 2 seconds (depending on the power level) even when the antennas are operated in dipole mode. It appears that the local power fluxes on the lateral protection may exceed the nominally expected fluxes of 5 MW/m(sup 2). Concentrated heat fluxes can result in hot spots with temperatures greater than 1000 C and can result in damage to the carbon tiles that make up the armor on the lateral protection. Initial experiments with plasmas having I(sub p) = 0.8 - 1.6 MA, q(a) = 3 - 6, and P(sub RF) = 1 - 2 MW have been carried out to characterize the phenomena that could contribute to the overheating and develop the diagnostic tools to be used in more comprehensive studies. TARGET AREA STRUCTURAL SUPPORT SYSTEMS DESIGN TO ACHIEVE THE MICRON-LEVEL STABILITY REQUIREMENT OF THE NATIONAL IGNITION FACILITY (NIF)

D. S. Ng, V. P. Karpenko, and R. Wavrik (Sandia National Labs., Albuquerque, NM.) Jun. 1994 5 p Presented at the 11th Topical Meeting on the Technology of Fusion Energy, New Orleans, LA, 19-23 Jul. 1994
(Contract W-7405-eng-48)
(DE94-017696; UCRL-JC-115586; CONF-9407118-1) Avail: CASI HC A01/MF A01

The Target Area Structural Support (TASS) systems are designed to provide an optically stable support for the target area systems and personnel access platforms for the 192 laser beam configuration. The conceptual design of the TASS systems was an optimum configuration selected from three designs on which performance studies were conducted. The supporting bases for the design selection were the analytical results, operation, and cost effective. DOE

(AD-A286380; Rept-015FR; DNA-TR-93-190) Avail: CASI HC A05/MF A01

Recent models predict that individual wires in an array will form heterogeneous current channels when exploded by a current pulse. The resulting nonuniform magnetic forces will cause the outer current carrying corona to implode ahead of the core, in contrast to earlier models where the uniform current channel implodes as a unit. Laser based absorption and holographic techniques have been used to study the explosion characteristics of 33 micrometers C and 25 micrometers Al wire loads and the implosion dynamics of two wire Al loads on a 300 kA generator. X-ray techniques have been used to study the implosion and radiation characteristics of Mg coated Al wire arrays on the 4 MA Double Eagle generator. The high resolution laser diagnostics reveal a coronal plasma that implodes far in advance of the core in the two wire experiments. This preemptive implosion of the corona is exacerbated when a plasma opening switch (POS) shortens the current pulse. The Mg coated Al wire load experiments indicate that only the outer 30-50% of the load mass implodes to radiate in the K-shell. The load straggling implies a softened implosion and reduced radiation efficiency. The results demonstrate the importance of the early time current distribution on the implosion and radiation characteristics of the load and underscore the need for adequate modeling to scale present results up to larger machines. A METHOD FOR MEASURING THE INDUCTIVE ELECTRIC FIELD PROFILE AND NONINDUCTIVE CURRENT PROFILES ON D3-D

C. B. Forest, T. C. Luce, P. A. Politzer, L. L. Lao, K. Kupfer (Oak Ridge Inst. for Science and Education, TN.), and D. Wroblewski (Lawrence Livermore National Lab., Livermore, CA.) Jul. 1994 4 p Presented at the 21st European Conference on Controlled Fusion and Plasma Physics, Marseilles, France, 26 Jun. - 1 Jul. 1994 Submitted for publication
(Contracts DE-AC03-89ER-51114; W-7405-eng-48; GA Proj. 3466)
(DE94-016683; GA-A-21742; CONF-940635-7) Avail: CASI HC A01/MF A01

A new technique for determining the parallel electric field profile and noninductive current profile in tokamak plasmas has been developed and applied to two DIII-D tokamak discharges. Central to this technique is the determination of the current density profile, J(rho), and poloidal flux, psi(rho), from equilibrium reconstructions. From time sequences of the reconstructions, the flux surface averaged, parallel electric field can be estimated from appropriate derivatives of the poloidal flux. With a model for the conductivity and measurements of T(sub e) and Z(sub eff), the noninductive fraction of the current can be determined. Such a technique gives the possibility of measuring directly the bootstrap current profile and the noninductively driven current from auxiliary heating such as neutral beam injection or fast wave current drive. Furthermore, if the noninductively driven current is small or if the noninductive current profile is assumed to be known, this measurement provides a local test of the conductivity model under various conditions. RECENT RESULTS FROM FAST WAVE CURRENT DRIVE EXPERIMENTS ON DIII-D

R. I. Pinsker, S. C. Chiu, and F. W. Baity (Oak Ridge National Lab., TN.) Jul. 1994 4 p Presented at the European Conference on Controlled Fusion and Plasma Physics, Marseilles, France, 26 Jun. - 1 Jul. 1994
(Contracts DE-AC03-89ER-51114; DE-AC05-84OR-21400; DE-AC02-78ET-51013)
(DE94-016718; GA-A-21759; CONF-940635-8) Avail: CASI HC A01/MF A01

The goal of the ongoing DIII-D Fast Wave Current Drive (FWCD) experiments is to demonstrate fully noninductive sustainment of the tokamak discharge by direct electron absorption of the fast magnetosonic wave. Control of the current density profile obtained by combining FWCD with other noninductive current drive techniques (neutral beam injection, electron cyclotron current drive, bootstrap current) will permit extension to long pulse of the improved confinement regimes that have been obtained transiently in DIII-D by use of current and elongation ramps. A COMPARISON OF KINETIC AND MULTIFLUID SIMULATIONS OF LASER-PRODUCED COLLIDING PLASMAS

P. W. Rambo and R. J. Procassini Sep. 1994 6 p Presented at the 15th International Conference on the Numerical Simulation of Plasmas, Valley Forge, PA, 7-9 Sep. 1994
(Contract W-7405-eng-48)
(DE94-016447; UCRL-JC-117498; CONF-9409105-2) Avail: CASI HC A02/MF A01

The collision and subsequent interaction of counter-streaming plasmas occurs in several areas of laser-plasma research including double foil targets for x ray lasers and the plasma blow-off inside ICF hohlraums. Because a single fluid model allows for only one value of the flow velocity at any one spatial location, interpenetration of the plamas is not allowed resulting in immediate stagnation with complete conversion of the ion-streaming kinetic energy to thermal energy. Multifluid models have been developed which employ multiple ion fluid species that interact through the self-consistent electrostatic field and collisional coupling. Because they are approximations to a kinetic situation, the form of these coupling coefficients is not unique, with various workers using differing approximations. More recently, Larroche has implemented a finite difference approach to the ion Fokker-Planck equation while Jones and co-workers have performed two-dimensional simulations of colliding plasmas using a particle-in-cell code with a new collisional model. Our kinetic modeling also makes use of particle in cell (PIC) techniques with Monte Carlo (MC) particle-particle collisions algorithm that is equivalent to the Fokker-Planck collision operator. We have made direct comparison of this MC-PIC model to multifluid simulations on both simple slowing-down and equilibration problems as well as problems characteristic of laser generated colliding plasmas. These comparisons have established the validity of the multifluid model as well as aided in the development of the kinetic capability for more challenging geometries. DOE

(DE94-018549; UCRL-JC-115555; CONF-940618-79) Avail: CASI HC A01/MF A01

A series of small-scale experiments has been proposed to study critical physics issues of a circular induction accelerator for heavy-ion fusion. Because the beam dynamics will be dominated by space charge, the experiments require careful design of the lattice and acceleration schedule. A hierarchy of codes has been developed for modeling the experiments at different levels of detail. The codes are discussed briefly, and examples of the output are presented. DOE

Significant exhaust of thermal helium in a diverted, H-mode deuterium plasma has been demonstrated for the first time on the DIII-D tokamak using an in-vessel cryopump conditioned with an argon frost. The helium, introduced via gas puffing, is observed to reach the plasma core and then is readily removed from the plasma with a time constant of (approximately) 8-15 energy confinement times. Detailed analysis of the helium profile evolution indicates that the exhaust rate is limited by the exhaust efficiency of the pump (approximately 5%) and not by the intrinsic helium transport properties of the plasma. Additional studies focusing on the recycling properties of helium relative to deuterium in the divertor region indicate some dependence of the helium concentration in the divertor pumping plenum on the divertor outer strike-point (OSP) position in Ohmic discharges. However, the helium concentration in the plenum appears to have little dependence on OSP position in beam-heated, ELMing H-mode discharges. DOE

NEW HIGH TEMPERATURE PLASMAS AND SAMPLE INTRODUCTION SYSTEMS FOR ANALYTICAL ATOMIC EMISSION AND MASS SPECTROMETRY
A. Montaser 1994 9 p
(Contract DE-FG02-93ER-14320)
(DE94-018580; DOE/ER-14320/2) Avail: CASI HC A02/MF A01

This research follows a multifaceted approach, from theory to practice, to the investigation and development of novel helium plasmas, sample introduction systems, and diagnostic techniques for atomic and mass spectrometries. During the period January 1994 - December 1994, four major sets of challenging research programs were addressed that each included a number of discrete but complementary projects: (1) The first program is concerned with fundamental and analytical investigations of novel atmospheric-pressure helium inductively coupled plasmas (He ICPS) that are suitable for the atomization-excitation-ionization of elements, especially those possessing high excitation and ionization energies, for the purpose of enhancing sensitivity and selectivity of analytical measurements. (2) The second program includes simulation and computer modeling of He ICPS. The aim is to ease the hunt for new helium plasmas by predicting their structure and fundamental and analytical properties, without incurring the enormous cost for extensive experimental studies. (3) The third program involves spectroscopic imaging and diagnostic studies of plasma discharges to instantly visualize their prevailing structures, to quantify key fundamental properties, and to verify predictions by mathematical models. (4) The fourth program entails investigation of new, low-cost sample introduction systems that consume micro- to nanoliter quantity of sample solution in plasma spectrometries. A portion of this research involves development and applications of novel diagnostic techniques suitable for probing key fundamental properties of aerosol prior to and after injection into high-temperature plasmas. These efforts, still in progress, collectively offer promise of solving singularly difficult analytical problems that either exist now or are likely to arise in the future in the various fields of energy generation, environmental pollution, material science, biomedicine and nutrition. [DESIGN AND CONSTRUCTION OF THE HSX EXPERIMENT] Progress Report
1 May 1994 7 p
(Contract DE-FG02-93ER-54222)
(DE94-018657; DOE/ER-54222/1) Avail: CASI HC A02/MF A01

Brief statements on the progress of the design and construction of the HSX experiment are reported. Topics covered include the modular and auxiliary coil systems, the coil support structure, vacuum vessel, the ECH system, the magnet power supply and site. The proposed budget for Year 2 (August 1, 1994 through July 31, 1995) is presented. The effects of a flat funding profile (based on Year 2 budget level of $1137K) on out-years and the HSX project schedule are discussed. The stretching out of the program to accommodate the reduced funding profile should result in only a slight delay in HSX operations. DOE

ION TEMPERATURE MEASUREMENT OF INDIRECTLY-DRIVEN IMPLOSIONS USING A GEOMETRY-COMPENSATED NEUTRON TIME-OF-FLIGHT DETECTOR
T. J. Murphy, R. A. Lerche, C. Bennett, and G. Howe May 1994 15 p Presented at the 10th Topical Conference on High-Temperature Plasma Diagnostics, Rochester, NY, 8-12 May 1994
(Contract W-7405-eng-48)
(DE94-016967; UCRL-JC-116199; CONF-940552-23) Avail: CASI HC A03/MF A01

A geometry-compensated neutron time-of-flight detector has been constructed and used on Nova to measure ion temperatures from indirectly-driven implosions with yields between 2.5 and 5 x 10(exp 9) DD neutrons. The detector, which has an estimated response time of 250 ps, was located 150 cm from the targets. Due to the long decay time of the scintillator, the time-of-flight signal must be unfolded from the measured detector signal. Several methods for determining the width of the neutron energy spectrum from the data have been developed and give similar results. Scattered x rays continue to be a problem for low yield shots, but should be brought under control with adequate shielding. DOE

CHARACTERIZATION OF NOVA PLASMAS USING AN X-RAY SPECTROMETER WITH TEMPORAL AND SPATIAL RESOLUTION
C. A. Back, R. L. Kauffman, P. Bell, and J. D. Kilkenny May 1994 13 p Presented at the 10th Topical Conference on High-Temperature Plasma Diagnostics, Rochester, NY, 8-12 May 1994
(Contract W-7405-eng-48)
(DE94-016970; UCRL-JC-116211; CONF-940552-22) Avail: CASI HC A03/MF A01

Spectroscopic diagnostics have great potential to obtain high temperature measurements of plasmas created in ICF targets. The plasmas may be over 1 mm in size and therefore, one of the first steps in making accurate spectroscopic measurements has been to improve the resolution of the instrument. A spectrograph is now available for Nova experiments which takes advantage of gated technology by coupling a Bragg crystal to a microchannel plate that can record data over a 250 ps time frame. The crystal disperses the x-rays, while slits add the ability to image the plasmas in the perpendicular direction. The characteristics of this diagnostic, TSPEC, will be evaluated for laser-produced plasmas. Recent data will be presented from colliding plasmas and large-scale hohlraums which indicate that imaging can greatly enhance the ability to diagnose these plasmas. DOE

A NEW ALPHA PARTICLE DIAGNOSTIC USING KNOCK-ON ION TAILS
R. K. Fisher, P. B. Parks, J. M. McChesney, and M. N. Rosenbluth (California Univ., San Diego, CA.) Jun. 1994 14 p Presented at the 10th Topical Conference on High-Temperature Plasma Diagnostics, Rochester, NY, 8-12 May 1994
(Contracts DE-FG03-92ER-54150; DE-AC03-89ER-51114)
(DE94-015856; GA-A-21715; CONF-940552-16) Avail: CASI HC A03/MF A01

We propose a new method of measuring the fast confined ct-particle distribution in a reacting plasma. The presence of ct-particles in a D-T plasma will create a high energy tail on the deuterium and tritium ion energy distributions. A 3.5 MeV alpha can transfer 3.4 MeV to a tritium ion in a single elastic scattering interaction. Calculations of the size of these knock-on tails in tokamaks such as TFTR, JET, and ITER show that it may be possible to measure these tails and provide information on the fast confined alphas. The knock-on tail ions will produce D-T neutrons with energies up to 20.7 MeV, so that D-T neutron spectroscopy can be used to monitor the alpha population. Neutron spectroscopy looks especially attractive for ITER. A collimated array of threshold neutron activation detectors could be used to deduce the confined alpha density profile. Tests of this diagnostic can also be done on TFTR and JET. Existing high energy neutral particle analyzers may allow observation of the ion tails directly via passive and/or active charge exchange. (AD-A279630; WL-TR-93-2116) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The present report describes experimental and analytical studies of energy transfer and chemical reaction in diatomic and small polyatomic gases under conditions of extreme disequilibrium of the vibrational modes. Primary emphasis is on collision-dominated environments with relatively low translational/rotational mode temperatures, which are characteristic of a variety of gas discharges, plasma chemical reactors and high enthalpy supersonic gas dynamic expansions. Some additional work has also been directed to the complementary environment in which the translational/rotational mode temperatures are high, and the vibrational mode energy content is initially low. This latter environment is characteristic of strong shock waves in gases, such as occurs during planetary entry of hypersonic aerospace vehicles. The report details vibration-translation (V-T), vibration-electronic (V-E), associative ionization, and dissociation processes in CO and NO. There are some data and rate models for related diatomic and small polyatomic species. Emphasis is placed on energy transfer processes involving high quantum states. DTIC

APPROXIMATE RIEMANN SOLVER FOR MAGNETOHYDRODYNAMICS (THAT WORKS IN MORE THAN ONE DIMENSION)
K. G. Powell Mar. 1994 15 p
(PB95-135802; CWI-NM-R9407) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

An approximate Riemann solver is developed for the governing equations of ideal magnetohydrodynamics (MHD). The Riemann solver has an eight-wave structure, where seven of the waves are those used in previous work on upwind schemes for MHD, and the eighth wave is related to the divergence of the magnetic field. The structure of the eighth wave is not immediately obvious from the governing equations as they are usually written, but arises from a modification of the equations that is presented in this paper. The addition of the eighth wave allows multi-dimensional MHD problems to be solved without the use of staggered grids or a projection scheme, one or the other of which was necessary in previous work on upwind schemes for MHD. A test problem made up of a shock tube with rotated initial conditions is solved to show that the two-dimensional code yields answers consistent with the one-dimensional methods developed previously. We propose hybrid model equations in toroidal (or more general) geometry for magnetically confined plasmas. This is suitable for low frequency toroidal modes, for example, the trapped electron and current diffusive ballooning instabilities. This model consists of fluid ions and drift kinetic electrons. We discuss the numerical algorithm of these model equations. The linear dispersion relation of this model equations that defines the requirements of the model for describing these modes is also discussed. DOE

PLASMA SHAPE EXPERIMENTS FOR AN OPTIMIZED TOKAMAK
A. W. Hyatt, T. H. Osborne, and E. A. Lazarus (Oak Ridge National Lab., TN.) Jul. 1994 4 p Presented at the European Conference on Controlled Fusion and Plasma Physics, Marseilles, France, 26 Jun. - 1 Jul. 1994
(Contracts DE-AC03-89ER-51114; DE-AC05-84OR-21400)
(DE94-017508; GA-A-21761; CONF-940635-11) Avail: CASI HC A01/MF A01

In this paper we present results from recent experiments at DIII-D which measured the plasma stability and confinement performance product, beta(tau)(sub E), in one previously studied and three new plasma shapes. One important goal of these experiments was to identify performance vs. shape trends which would identify a shape compatible with both high performance and the planned effort to decrease the power flux to the divertor floor using a closed 'slot' divertor geometry. The closed divertor hardware must be designed for a reduced set of plasma shapes, so care must be taken to choose the shape that optimizes beta(tau)(sub E) and divertor performance. The four shapes studied form a matrix of moderate and high elongations (kappa congruent to 1.8 and 2.1) and low and high triangularities (delta congruent to 0.3 and 0.9). All configurations were double-null diverted (DND), held fixed during a shot, with neutral beam heating. The shapes span a range of X-point locations compatible with the envisioned closed divertor. We find that from shape to shape, a shot's transient normalized performance, beta(sub N)H, where beta(sub N) is equivalent to beta/(I(sup p)/aB(sub T)) and H is equivalent to tau(sub E)/tau(sub E)(sup ITER-89P), increases strongly with triangularity, but depends only weakly on elongation. However, the normalized performance during quasi stationary ELMing H-mode, to which these discharges eventually relax, is insensitive to both triangularity and elongation. The moderate elongation, high triangularity DND shape is shown to be near optimum for future studies on DIII-D. DOE

Wroblewski (Lawrence Livermore National Lab., Livermore, CA.), and O. Sauter (Centre de Recherches en Physique des Plasmas, Lausanne, Switzerland.) Jul. 1994 4 p Presented at the European Conference on Controlled Fusion and Plasma Physics, Marseilles, France, 26 Jun. - 1 Jul. 1994
(Contracts DE-AC03-89ER-51114; W-7405-eng-48)
(DE94-017509; GA-A-21754; CONF-940635-9) Avail: CASI HC A01/MF A01

Recent high beta discharges in DIII-D, reaching values up to beta = 12.5%, demonstrate that a resistive wall can stabilize low-n MHD modes in a rotating plasma. The maximum beta values reached in discharges with broad current profiles (internal inductance ell(sub i) approximately equal to 0.7) are up to 40% greater than the limit predicted by ideal MHD stability calculations in the absence of a wall, but are consistent with predicted limits assuming a perfectly conducting wall at the position of the vacuum vessel. This wall stabilization is observed for time scales long compared with the resistive penetration time of the wall. Plasma rotation is essential to the stabilization, and instabilities with characteristics of the predicted 'resistive wall' mode are observed only when the rotation velocity approaches zero at the mode rational surface. DOE

POWER BALANCE IN D3-D DURING SINGLE-NULL ELMing H-MODE PLASMAS
A. W. Leonard, C. J. Lasnier (Lawrence Livermore National Lab., Livermore, CA.), and J. W. Cuthbertson (Sandia National Labs., Albuquerque, NM.) Jul. 1994 16 p Presented at the 11th International Conference on Plasma Surface Interactions in Controlled Fusion Devices, Mito, Japan, 23-27 May 1994
(Contracts DE-AC03-89ER-51114; DE-AC04-76DP-00789; W-7405-eng-48)
(DE94-016680; GA-A-21693; CONF-940580-13) Avail: CASI HC A03/MF A01

We account for greater than or equal to 85% of the injected power in DIII-D during single-null diverted ELMing H-mode discharges. Core plasma radiation accounts for less than or equal to 18% with the rest flowing through the scrape-off layer to the inboard and outboard divertors. The total power roughly splits in an in:out ratio of 1:1.3. Of the power entering the outboard divertor 75% leaves as direct heat flux to the divertor target plates with the rest in the form of radiation. In the inboard divertor, however, 75% of the power leaves as radiation with the rest as divertor target plate heat flux and charge exchange losses. The in:out ratio remains constant over a range of injected power and plasma current and even as divertor conditions change due to gas puffing. DOE

ENHANCED SCRAPE-OFF LAYER PLASMA IN D3-D DOUBLE-NULL DISCHARGES
J. G. Watkins (Sandia National Labs., Albuquerque, NM.), R. A. Jong (Lawrence Livermore National Lab., Livermore, CA.), and R. A. Moyer (California Univ., Los Angeles, CA.) Jul. 1994 14 p Presented at the 11th International Conference on Plasma Surface Interactions in Controlled Fusion Devices, Mito, Japan, 23-27 May 1994
(Contracts DE-AC03-89ER-51114; DE-FG03-89ER-51121; DE-AC04-94AL-85000; W-7405-eng-48)
(DE94-017977; GA-A-21708; CONF-940580-18) Avail: CASI HC A03/MF A01

In this paper, the authors examine a denser and broader scrape-off layer (SOL) plasma, first seen in VH mode, in the D3-D tokamak. The enhanced SOL appears in many types of double-null (DN) discharges and is not a property of VH-mode only. The DN enhanced SOL density and temperature profiles exhibit a 5-6 cm broad profile outside the separatrix. For DN and single-null (SN) boundary geometry with similar core plasma conditions, the enhanced SOL is only observed in high triangularity discharges. The origin of the enhanced SOL is, however, not yet understood. DOE

A compact self contained portable probe system has been designed and developed to diagnose the edge plasma of devices of different sizes and configurations. The system measures both the mean and the fluctuation quantities of density, temperature and potential from a standardized Langmuir probe array using a fast reciprocating probe drive. It can also be used for other fluctuation diagnostics, such as magnetic probes. The data acquisition and analysis is performed on a Macintosh IIfx which provides a user-friendly environment. The results obtained by the signal processing routines are stored in a tabloid format to allow comparative studies. The resulting database is a core part of the portable signal analysis system. To date measurements have been performed on the stellarator ATF, the reversed field pinch ZT40(M), and the tokamaks TEXT, Versator, Phaedrus-T and TFTR. The data are presently being analyzed and the results collected into the database for the purpose of edge turbulence and transport studies. Existing published data are also being included. The edge database, an output of this project, will provide readily available information for other experimental groups to compare their results with, and for theoretical groups to validate (or otherwise) the predictions of their models. CURRENT DIFFUSIVE BALLOONING MODE IN SECOND STABILITY REGION OF TOKAMAKS
M. Yagi (Japan Atomic Energy Research Inst., Naka, Japan.), K. Itoh, S. Itoh, A. Fukuyama, and M. Azumi Sep. 1993 20 p
(DE94-770690; NIFS-246) Avail: CASI HC A03/MF A01

Stability of the current diffusive ballooning mode in tokamaks with high toroidal mode number is analyzed in the region of second-stability against the ideal magnetohydrodynamic mode. It is found that the growth rate of the current diffusive ballooning mode is decreased by the reduction of the geodesic curvature driving force. The reduction of thermal conductivity in the limit of very weak shear or negative shear in comparison with standard shear is also shown. DOE

SIMULATION OF TEARING MODE STABILIZATION BY USING ECH
Gen-Ichi Kurita (Japan Atomic Energy Research Inst., Naka, Japan.), Takashi Tuda, Masafumi Azumi, and Tatsuoki Takeda Nov. 1993 39 p
(DE94-770700; JAERI-M-93-224) Avail: CASI HC A03/MF A01

Nonlinear simulations based on the reduced set of resistive MHD equations with the transport equation of electron temperature are carried out to investigate the effect of electron temperature perturbation induced by local heating of ECH on a tearing mode activity. Effect of poloidal plasma rotation is also considered in the simulations. It is shown that the local heating can suppress low-m tearing mode instability when O-point of the rotating magnetic island is effectively heated. Large parallel heat conduction causes the radially extending heat deposition profile for small width of magnetic island and magnitude of parallel heat conduction determines the heat power necessary for complete stabilization of the tearing mode. OBSERVATION OF STRONG EMISSION FROM NeIX AND NeX TRANSITIONS IN A LASER-DRIVEN PLASMA
John K. Crane, Todd Ditmire, Hoang Nguyen, and Michael D. Perry Jul. 1994 7 p Presented at the 4th International Colloquium on X-ray Lasers, Williamsburg, VA, 16-20 May 1994
(Contract W-7405-eng-48)
(DE95-002265; UCRL-JC-116774; CONF-940592-8) Avail: CASI HC A02/MF A01

The authors observe strong emission from the 1s(exp 2)-1snp Rydberg series in Helium-like neon and from the Lyman-(alpha) transition in Helium -like neon. These emissions are observed when 1.05 micrometers light from a 650 femtosecond laser is focused into the dense, localized output of a pulsed, supersonic nozzle. The maximum focal irradiance of the laser was measured at full power in a vacuum to be 2 x 10(exp 18) W/sq cm. Although emissions from lower charge states such as Ne6(+) and Ne7(+) closely follow rates predicted by tunneling theory, emissions from Ne8(+) and Ne9(+) are observed at irradiances two order of magnitude below tunneling theory estimates (e.g. the He-(alpha) line appears at 2 x 10(exp 17) W/sq cm). They discuss the origins of these anomalously high charge states and the implications to recombination-pumped x rays lasers. DOE

IDEAL MAGNETOHYDRODYNAMIC STABILITIES IN JT-60 AND D3-D TOKAMAK PLASMAS
Takahisa Ozeki (Japan Atomic Energy Research Inst., Naka, Japan.) Oct. 1993 226 p
(DE94-770684; JAERI-M-93-184) Avail: CASI HC A11/MF A03

Magnetohydrodynamic (MHD) instabilities of plasmas with a good (enhanced) energy confinement, obtained in the H-mode or after pellet injection in JT-60 and DIII-D tokamaks, are investigated. In enhanced-confinement plasmas, many kinds of MHD instabilities occurred and they inhibit further improvement. In the present thesis, therefore, the mechanism of MHD stability is investigated by computational analysis, and ways to further improve the confinement by suppression of MHD instabilities are discussed. (DE94-770685; NIFS-240) Avail: CASI HC A03/MF A01

The ion heat pulse after sawtooth crash is studied with the time-of-flight neutral measurement on the JFT-2M tokamak. The rapid change of the bulk ion energy distribution near the edge is observed after sawtooth crash. The delay time is measured and the effective measuring position is estimated by a neutral transport code, then the thermal conductivity, chi(sub i)(exp HP), of about 15 +/- 10 sq m/sec is evaluated for the L-mode plasma. The simple diffusive model with constant chi(sub i)(exp HP), however, does not explain the amplitude of the pulse in the ion energy distribution. DOE

OBSERVATION OF NON DIFFUSIVE TERM OF TOROIDAL MOMENTUM TRANSPORT IN THE JFT-2M TOKAMAK
K. Ida, Y. Miura, T. Matsuda, and K. Itoh Aug. 1993 22 p
(DE94-770686; NIFS-241) Avail: CASI HC A03/MF A01

Toroidal rotation velocity profiles are measured with multi-chord charge-exchange spectroscopy to show that from the discharge the neutral beams are interchanged from parallel (co) to anti-parallel (counter) to the direction of the plasma current. Transport analysis of toroidal momentum in the transient phase suggests the existence of a non-diffusive term in the toroidal momentum transport. This non-diffusive term appears as a spontaneous source of the toroidal momentum in the direction that is anti-parallel to the plasma current. DOE

EXTENDED THEORY OF MAIN ION AND IMPURITY ROTATION AND BOOTSTRAP CURRENT IN A SHEAR LAYER
Y. B. Kim, F. L. Hinton, H. St.John, T. S. Taylor, D. Wroblewski (Lawrence Livermore National Lab., Livermore, CA.), and J. Kim Nov. 1993 5 p Presented at the IAEA Meeting on H-Mode Physics, Naka, Japan, 15-17 Nov. 1993
(Contracts DE-FG03-92ER-54150; DE-AC03-89ER-51114; W-7405-eng-48; Proj. 3938; Proj. 3466)
(DE94-015857; GA-A-21522; CONF-9311147-10) Avail: CASI HC A01/MF A01

In this paper, standard neoclassical theory has been extended into the shear layer. Main ion and impurity ion rotation velocity and bootstrap current within shear layer in H-mode are discussed. Inside the H-mode shear layer, standard neoclassical theory is not valid since the ion poloidal gyroradius becomes comparable to pressure gradient and electric field gradient scale length. To allow for arbitrary ratio of rho theta(sub i)/L(sub n) and rho theta(sub i)/L(sub Er) a new kinetic theory of main ion species within electric field shear layer has been developed with the assumption that rho theta(sub i)/R(sub o) is still small. As a consequence, both impurity flows and bootstrap current have to be modified. We present modified expressions of impurity flows and bootstrap current are presented neglecting ion temperature gradient. Comparisons with DIII-D measurements are also discussed. DOE

The VH-mode regime of high confinement has been observed in both DIII-D and JET. VH-mode is characterized by thermal confinement twice that seen in H-mode, with the edge transport barrier penetrating deeper into the plasma. Two mechanisms have been identified as important in achieving this high level of confinement. Expansion of the E x B velocity shear turbulence suppression zone is important in allowing reductions in local transport, while access to the second ballooning stability regime in the edge allows avoidance or elimination of ELMs which impede the confinement improvement. The high performance phase of these discharges is usually terminated by an MHD event which removes energy from a large portion of the plasma cross-section, and is followed by an H-mode phase. DOE

EXPERIMENTAL MEASUREMENTS AND MODELING OF IMPURITY TRANSPORT IN THE DIVERTOR AND BOUNDARY PLASMA OF D3-D

W. P. West, N. H. Brooks, and S. L. Allen (Lawrence Livermore National Lab., Livermore, CA.) Jul. 1994 4 p Presented at the European Conference on Controlled Fusion and Plasma Physics, Marseilles, France, 26 Jun. - 1 Jul. 1994
(Contracts DE-AC03-89ER-51114; W-7405-eng-48; DE-AC04-76DP-00789)
(DE94-016519; GA-A-21762; CONF-940635-5) Avail: CASI HC A01/MF A01

Analysis of trace impurity injection experiments on D3-D during a beam power scan is presented. Spectroscopic measurements indicate that as beam power is increased, and concomitantly ELM frequency and scrape-off-layer thickness increase while energy confinement decreases, the core impurity content decreases only slightly. Modeling of the edge plasma using the UEDGE 2D and NEWT1D plasma fluid codes indicate that as beam power is increased, the parallel forces on an impurity ion increase in the direction from the divertor and toward the core plasma. Experiments using the divertor cryopump to induce higher parallel particle flow toward the divertor demonstrate significant reduction in core impurity content. These results indicate that parallel forces on impurity ions in the scrape off layer are playing a significant role in core impurity content. DOE

THE PARAMETRIC DEPENDENCE OF THE SPATIAL STRUCTURE OF THE RADIAL ELECTRIC FIELD AT THE PLASMA EDGE IN THE D3-D TOKAMAK

P. Gohil, K. H. Burrell, R. J. Groebner, J. Kim, and R. P. Seraydarian Jul. 1994 4 p Presented at the European Conference on Controlled Fusion and Plasma Physics, Marseilles, France, 26 Jun. - 1 Jul. 1994
(Contract DE-AC03-89ER-51114)
(DE94-016520; GA-A-21756; CONF-940635-6) Avail: CASI HC A01/MF A01

Much recent theoretical and experimental work has focused on the mechanisms controlling the transition from L-mode to H-mode and the subsequent improvement in transport and confinement. Measurements of the radial electric field, E(sub r), with high spatial and time resolution at the L-H transition have led to an understanding of the improved confinement of the plasma edge in H-mode plasmas based on the stabilization of plasma turbulence by sheared E x B flow. The radial electric field just inside the last closed flux surface (LCFS) changes dramatically at the L-H transition and a well-like structure in E(sub r) forms simultaneously at the transition. At present, there is no accepted theory which gives the spatial structure of E(sub r) near the plasma edge and which can predict its time evolution. Present theories propose mechanisms for the generation of a negative E(sub r) at the L-H transition, the bifurcation conditions for the transition and the stabilization of turbulence by sheared E x B flow. Although the various theories invoke different mechanisms to derive the negative E(sub r) (e.g., ion orbit losses, Stringer spin-up, nonlinear transport theory, self-regulating turbulence) they have as yet to come into full agreement with the observed experimental results and, in particular, the observed behavior of the poloidal rotation and pressure gradient of the main ions at the transition. Furthermore, these theories need to be extended to explain the formation of the spatial structure of E(sub r) at the transition and its temporal development into the H-mode. In order to help development of theories on the E(sub r) profile, we have examined the dependence of the radial profile of E(sub r) on different plasma parameters. DOE

NUMERICAL ANALYSIS OF ENERGETIC PARTICLE STABILIZATION OF BALLOONING MODES IN FINITE-ASPECT-RATIO TOKAMAKS

Qibing He (Southwestern Inst. of Physics, Chengdu, China.), Qiyang Peng (Southwestern Inst. of Physics, Chengdu, China.), and Wenxiao Qu (Southwestern Inst. of Physics, Chengdu, China.) Sep. 1993 12 p
(DE94-631397; CNIC-00792; SIP-0067) Avail: CASI HC A03/MF A01
(US Sales Only)

The effect of energetic trapped particles on the stabilization of ballooning modes in finite-aspect-ratio tokamaks is numerically analyzed. The numerical solution of boundary value problem of an integro-differential equation is successfully obtained by RKF integral method with variable step size. The results show that the instability domain of ballooning modes becomes small along with the increase of energetic particles pressure. The energetic trapped particles can partially or completely suppress the instability of ballooning modes. DOE

N95-21165# China Nuclear Information Centre, Beijing (China).

EXPERIMENTAL INVESTIGATION OF MOLECULAR BEAM INJECTION IN HL-1 TOKAMAK

Jul. 1993 12 p
(DE94-631456; CNIC-00783; SIP-0065) Avail: CASI HC A03/MF A01
(US Sales Only)

A new method of gas puffing is presented. The molecular beam, formed by high pressure deuterium gas through Larval nozzle and skimmer slit, is injected into the HL-1 vacuum vessel. The deuterium molecular current from the nozzle passing through the skimmer is about 3 x 10(exp 20)/s. At the line average electron density of 5.2 x 10(exp 19)/cu m, the beam velocity is about 100 m/s. As the plasma density and temperature increases, the influxes of deuterium particles attenuate quickly. When the molecular beam injection (MBI) just returned to normal gas puffing, the D(sub alpha) emission rapidly decreases, meanwhile, the particles move toward plasma center, the electron density is continuously peaking. The line average electron density rising lasts 45 ms. The thermal energy of plasma and confinement time for particles and energy are also increasing. The MBI is a direct and efficient gas fuelling mode, and the injected particles can reach to inside about 8 cm of plasma and q approximately equals 2 confinement region. Its efficiency of injection is about 50%. After the MBI, the particle recycling coefficient R on the wall is 0.6 which is 10% lower than that of normal gas puffing. DOE

PLASMA ELECTRODE POCKELS CELLS FOR THE BEAMLET AND NIF LASERS
M. A. Rhodes, B. Woods, J. DeYoreo, and J. Atherton May 1994 8 p Presented at the 11th Topical Meeting on the Technology of Fusion Energy, New Orleans, LA, 19-24 Jun. 1994
(Contract W-7405-eng-48)
(DE94-016541; UCRL-JC-115579; CONF-940630-37) Avail: CASI HC A02/MF A01

We describe Plasma Electrode Pockels Cells (PEPC) for the Beamlet laser and the proposed National Ignition Facility (NIF) laser. These PEPC's, together with passive polarizers, function as large aperture (greater than 35 x 35 sq cm) optical switches enabling the design of high-energy (greater than 5 kJ), multipass laser amplifiers. In a PEPC, plasma discharges form on both sides of a thin (1 cm) electro-optic crystal (KDP). These plasma discharges produce highly conductive and transparent electrodes that facilitate rapid (less than 100 ns) and uniform charging of the KDP up to the half-wave voltage (17 kV) and back to zero volts. We discuss the operating principles, design, and optical performance of the Beamlet PEPC and briefly discuss our plans to extend PEPC technology for the NIF. DOE

USE OF THE NATIONAL IGNITION FACILITY FOR THE DEVELOPMENT OF INERTIAL FUSION ENERGY
M. Tobin, G. Logan, A. Anderson, and T. DeLaRubiaDiaz Jun. 1994 13 p Presented at the 11th Topical Meeting on the Technology of Fusion Energy, New Orleans, LA, 19-24 Jun. 1994
(Contract W-7405-eng-48)
(DE94-016696; UCRL-JC-117395; CONF-940630-36) Avail: CASI HC A03/MF A01

The primary purpose of the workshop was to gather input from the inertial confinement fusion (ICF) laboratories, private industry, and universities on the potential use of the NIF to conduct experiments in support of the development of Inertial Fusion Energy (IFE). To accomplish this, we asked over 60 workshop participants to identify key credibility and development issues for IFE in four areas: Target Physics --Issues related to the design and performance of targets for IFE; Chamber Dynamics -- Issues in IFE chambers resulting from the deposition of x-rays and debris; Inertial Fusion Power Technology -- Issues for energy conversion, tritium breeding and processing, and radiation shielding; interactions of neutrons with materials; and chamber design; Target System -- Issues related to automated, high-production-rate manufacture of low-cost targets for IFE, target handling and transport, target injection, tracking, and beam pointing. These topics are discussed in this report. DOE

TARGET AREA DESIGN BASIS AND SYSTEM PERFORMANCE FOR THE NATIONAL IGNITION FACILITY
M. Tobin, V. Karpenko, K. Hagans, A. Anderson, J. Latkowski, R. Warren, R. Wavrik (Sandia National Labs., Albuquerque, NM.), R. Garcia (Sandia National Labs., Albuquerque, NM.), and J. Boyes (Sandia National Labs., Albuquerque, NM.) Jun. 1994 10 p Presented at the 11th Topical Meeting on the Technology of Fusion Energy, New Orleans, LA, 19-24 Jun. 1994
(Contract W-7405-eng-48)
(DE94-016697; UCRL-JC-115583; CONF-940630-32) Avail: CASI HC A02/MF A01

A description of Target Area systems performance shows that the target area conceptual design can meet its performance criteria. Before the shot, the target area provides a vacuum of less than 5 x 10(exp -5) Torr within 2 hours. A target, cryogenic or non-cryogenic, is placed to within 1 cm of chamber center with a positioner that minimizes vibration of the target. The target is then aligned to less than or equal to 7 microns by using the Target Alignment Sensor (TAS) system. The viewers in this system will also determine if the target is ready for illumination. Diagnostics are aligned to the necessary specifications by the alignment viewers. The target is shot and data is collected. Nearly all tritium (if present) is passed through the vacuum system and into the collection system. The analysis that supports the target area design basis is a combination of careful assumptions, data, and calculations. Some uncertainty exists concerning certain aspects of the source terms for x-rays and debris, material responses to this energy flux, and the full consequences of the material responses that do occur. For this reason, we have selected what we believe are conservative values in these areas. Advanced conceptual design activities will improve our understanding of these phenomena and allow a more quantitative assessment of the degree of conservatism inherent to the system. However, the results of this preliminary survey of target area operations indicate an annual shot rate of greater than 600 is feasible for this set of target area systems. DOE

REVIEW OF RECENT D-T EXPERIMENTS FROM TFTR
R. J. Hawryluk (Princeton Univ., NJ.), H. Adler (Princeton Univ., NJ.), P. Alling (Princeton Univ., NJ.), P. Alling (Princeton Univ., NJ.), C. Ancher (Princeton Univ., NJ.), H. Anderson (Princeton Univ., NJ.), J. L. Anderson, J. W. Anderson (Princeton Univ., NJ.), V. Arunasalam (Princeton Univ., NJ.), and G. Ascione (Princeton Univ., NJ.) et al 1994 22 p Presented at the 15th International Conference on Plasma Physics and Controlled Nuclear Fusion Research, Seville, Spain, 26 Sep. - 1 Oct. 1994
(Contract W-7405-eng-36)
(DE95-002755; LA-UR-94-3665; CONF-940933-14) Avail: CASI HC A03/MF A01

An extensive set of deuterium-tritium (D-T) experiments has been carried out on the Tokamak Fusion Test Reactor (TFTR), using nearly equal concentrations of deuterium and tritium. The fusion power has been increased to 9.3 MW, using 34 MW of neutral-beam heating, in a supershot discharge and to 6.7 MW in a high-(beta)(sub p) discharge following a current rampdown. Extensive lithium pellet injection has increased the confinement time to 0.27 s and enabled higher current operation in both supershot and high-(beta)(sub p) discharges. The energy confinement time, (tau)(sub E), was observed to increase in D-T, relative to D plasmas, by 20% and the n(sub i)(0) T(sub i)(0) (tau)(sub E) product by 55%. The improvement in thermal confinement was caused primarily by a decrease in ion heat conductivity in both supershot and limiter-H-mode discharges. ICRF heating of a D-T plasma, using the second harmonic of tritium, has been demonstrated. First measurements of the confined alpha particles have been performed and found to be in good agreement with TRANSP simulations. Initial measurements of the alpha ash profile have been compared with simulations using particle transport coefficients from He gas puffing experiments. The loss of alpha particles to a detector at the bottom of the vessel is well described by the first-orbit loss mechanism. No loss due to alpha-particle-driven instabilities has yet been observed. The TFTR experiments were able to challenge and confirm several of the underlying assumptions of the ITER design. DOE

Jassby (Princeton Univ., NJ.), L. C. Johnson (Princeton Univ., NJ.), D. R. Mikkelsen (Princeton Univ., NJ.), C. H. Skinner (Princeton Univ., NJ.), and J. D. Strachan (Princeton Univ., NJ.) et al 1994 14 p Presented at the 15th International Conference on Plasma Physics and Controlled Nuclear Fusion Research, Seville, Spain, 26 Sep. - 1 Oct. 1994
(Contracts W-7405-eng-36; DE-AC02-76CH-03073)
(DE95-002756; LA-UR-94-3667; CONF-940933-13) Avail: CASI HC A03/MF A01

Up to 9.3 MW of fusion power has been produced from deuterium-tritium (DT) fusion reactions in the Tokamak Fusion Test Reactor (TFTR). The total fusion yield from a single plasma pulse has reached 6.5 MJ. The experiments in TFTR with deuterium-tritium plasmas fueled and heated by neutral beam injection span wide ranges in plasma and operating conditions. Through the use of lithium pellet conditioning to control the edge recycling, the plasma confinement in TFTR has been improved to the point where the stability of the plasma to pressure driven modes is limiting the fusion power for plasma currents up to 2.5 MA. The central energy and fusion power densities in these plasmas are comparable to those expected in a thermalized DT reactor, such as ITER. DOE

The confinement and heating of supershot plasmas are significantly enhanced with tritium beam injection relative to deuterium injection in TFTR. The global energy confinement and local thermal transport are analyzed for deuterium and tritium fueled plasmas to quantify their dependence on the average mass of the hydrogenic ions. The radial profiles of the deuterium and tritium densities are determined from the DT fusion neutron emission profile. DOE

MHD PRESSURE DROP IN DUCTS WITH IMPERFECTLY INSULATING COATINGS
Siegfried Malang and Leo Buehler (Kernforschungszentrum G.m.b.H., Karlsruhe, Germany.) Aug. 1994 29 p Sponsored by European Fusion Technology Program
(Contract W-31-109-eng-38)
(DE95-002852; ANL/FPP/TM-269) Avail: CASI HC A03/MF A01

Liquid metal cooled blankets in fusion tokamak's are feasible only with electrically insulating coatings at the coolant channel walls. The requirements of such coatings are investigated and a simple analytical model is developed to determine the influence of imperfections in the coatings on the magneto-hydrodynamic pressure drop. This model is compared with the results of a 3D-MHD code based on the core flow approach. Both methods are in good agreement as long as the imperfections do not increase the pressure drop by more than 20%. The analytical model over-estimates the pressure drop for values larger than 20%. The importance of self-healing of coatings in case of cracking or flaking is quantified and an equation for the equilibrium conditions between the generation of imperfection and the healing of such spots is provided. DOE

SHOT-TO-SHOT COMPARISON OF THE FIRST Li-BEAM DRIVEN HOHLRAUM EXPERIMENTS
M. S. Derzon, G. E. Rochau, G. A. Chandler, A. R. Moats, and R. J. Leeper 1994 10 p Presented at the 10th Topical Conference on High-Temperature Plasma Diagnostics, Rochester, NY, 8-12 May 1994
(Contract DE-AC04-94AL-85000)
(DE94-016558; SAND-94-0385C; CONF-940552-17) Avail: CASI HC A02/MF A01

Shot-to-shot comparison of the first Li-beam Hohlraum experiments on PBFA 2 provides an opportunity to measure and determine the factors that affect the on-axis reproducibility of the Li ion beam. Both inner shell and thermal x-ray emission are used to estimate the relative beam power on target from shot to shot. The M- and L-shell Au x-ray yield measurements were made with an array of 11 filtered PIN detectors, and the thermal emission measurements were made with an array of three filtered bolometers. The analysis shows that the beam intensity on target varied by more than a factor of ten during the shot series. By correlating the results of the beam on target with other diagnostics and events, we have identified some potential causes for these variations. A slight difference in top-to-bottom timing appears critical in affecting relative peak power on target. DOE

ASSESSMENT OF DATABASE FOR INTERACTION OF TRITIUM WITH ITER PLASMA FACING MATERIALS
T. J. Dolan and R. A. Anderl Sep. 1994 137 p
(Contract DE-AC07-76ID-01570)
(DE95-002038; EGG-FSP-11348) Avail: CASI HC A07/MF A02

The present work surveys recent literature on hydrogen isotope interactions with Be, SS and Inconels, Cu, C, and V, and alloys of Cu and V. The goals are: (1) to provide input to the International Thermonuclear Experimental Reactor (ITER) team to help with tritium source term estimates for the Early Safety and Environmental Characterization Study and (2) to provide guidance for planning additional research that will be needed to fill gaps in the present materials database. Properties of diffusivity, solubility, permeability, chemical reactions, Soret effect, recombination coefficient, surface effects, trapping, porosity, layered structures, interfaces, and oxides are considered. Various materials data are tabulated, and a matrix display shows an assessment of the quality of the data available for each main property of each material. Recommendations are made for interim values of diffusivity and solubility to be used, pending further discussion by the ITER community. DOE

THEORY OF THE L-H TRANSITION
F. L. Hinton Sep. 1994 11 p Presented at the ISPP Workshop on the Theory of Fusion Plasmas, Varenna, Italy, 22-26 Aug. 1994
(Contract DE-AC03-89ER-51114)
(DE95-001389; GA-A-21778; CONF-9408176-1) Avail: CASI HC A03/MF A01

The theory of the L-H transition in tokamaks is discussed. A transport bifurcation model is presented, which predicts reasonably well several properties of the L-H transition in the DIII-D tokamak, including the evolution in time of the density and temperature profiles. A bifurcation in the radial transport occurs because of a nonlinear feedback mechanism involving the radial electric field. A spontaneous transition is predicted when certain conditions are met; no trigger mechanism is necessary. The predicted profile evolution in H-mode can include a transition to VH-mode, with its characteristically wider transport barrier at the plasma edge. Trigger mechanisms are discussed, as well as the idea of considering the L-H transition as a phase transition. DOE

PLASMA MODEL FOR CHARGING DAMAGE
M. C. Vella (Electro-Graph, Inc., Carlsbad, CA.), W. Lukaszek (Wafer Charging Monitors, Woodside, CA.), M. I. Current (Applied Materials, Santa Clara, CA.), and N. H. Tripsas (Advanced Micro Devices, Sunnyvale, CA.) Jul. 1994 11 p Presented at the IIT 1994 Conference, Catania, Italy, 13-17 Jun. 1994
(Contract DE-AC03-76SF-00098)
(DE95-000788; LBL-35964; CONF-9406267-1) Avail: CASI HC A03/MF A01

The mechanism responsible for charging damage is treated as beam/plasma driven differences in local floating potentials on the process surface. A cold plasma flood is shown to limit these potential differences. Beam/plasma J-V characteristics obtained with CHARM2 in a high current implanter are fit with the theory. With flood OFF, the fit corresponds to plasma buildup over the target surface. DOE

LOW DENSITY GAS AND FOAM TARGETS FOR ICF LONG SCALE LENGTH PLASMA EXPERIMENTS: FABRICATION AND CHARACTERIZATION
P. L. Gobby, M. A. Mitchell, N. E. Eliott, M. A. Salazar, J. C. Fermandez, W. W. Hsing, J. E. Moore, and V. M. Gomez 1994 6 p Presented at the Laser Interaction With Matter, Oxford, England, Oct. 1994

(Contract W-7405-eng-36)
(DE95-000935; LA-UR-94-3221; CONF-9410224-1) Avail: CASI HC A02/MF A01

Recent ICF experiments performed by the laser-matter interaction group at Los Alamos using the Nova laser to investigate long scale length plasmas required two types of special targets: gas-filled hohlraums and free-standing low density foams, both with densities in the range of 3-5 mg/cc. The mass in each case was provided by hydrogen and carbon - in the form of polymethylpentyene for the foam case and 2.2-dimethylpropane (i.e., neopentane, C_5H_{12}) at 1 atmosphere for the gas case. Dopants of Cl, Ti, Cr and Mn were added to the foams, while Ti and Cr coated carbon fibers were added to the hohlraums - both for isoelectronic x-ray spectroscopic temperature measurements. DOE

Reed Jul. 1994 22 p Presented at the ISFNT-3: 3rd International Symposium on Fusion Nuclear Technology, Los Angeles, CA, 27 Jun. - 1 Jul. 1994
(Contract W-31-109-eng-38)
(DE94-018370; ANL/TD/CP-83927; CONF-940664-29) Avail: CASI HC A03/MF A01

A review of experimental results is presented for magnetohydrodynamic (MHD) flow in rectangular channels with conducting walls and high aspect ratios (longer side parallel to the applied magnetic field), which are called slotted channels. The slotted channel concept was conceived at Efremov Institute as a method for reducing MHD pressure drop in liquid metal cooled blanket design. The experiments conducted by the authors were aimed at studying both fully developed MHD-flow, and the effect of a magnetic field on the hydrodynamics of 3-D flows in slotted channels. Tests were carried out on five models of the slotted geometry. A good agreement between test and theoretical results for the pressure drop in slotted channels was demonstrated. Application of a 'one-electrode movable probe' for velocity measurement permitted measurement of the M-shape velocity profiles in the slotted channels. Suppression of 3-D inertial effects in slotted channels of complex geometry was demonstrated based on potential distribution data. DOE

(DE95-002960; UCRL-ID-116263) Avail: CASI HC A19/MF A04

The MTX experiment was proposed in 1986 to apply high frequency microwaves generated by a free-electron laser (FEL) to electron cyclotron resonance heating (ECRH) in a high field, high density tokamak. As the absorption of microwaves at the electron cyclotron resonance requires high frequencies, the opportunity of applying a free-electron laser has appeal as the device is not limited to frequencies in the microwave or long millimeter wavelength regions, in contrast to many other sources. In addition, the FEL is inherently a high power source of microwaves, which would permit single units of 10 MW or more, optimum for reactors. Finally, it was recognized early in the study of the application of the FEL based on the induction linear accelerator, that the nonlinear effects associated with the intense pulses of microwaves naturally generated would offer several unique opportunities to apply ECRH to current drive, MHD control, and other plasma effects. It was consequently decided to adapt the induction accelerator based FEL to heating and controlling the tokamak, and to conduct experiments on the associated physics. To this end, the Alcator C tokamak was moved from the Massachusetts Institute of Technology (MIT) to the Lawrence Livermore National Laboratory where it was installed in Building 431 and operated from March, 1989, until the conclusion of the experiment in October, 1992. The FEL, based on the ETA-11 accelerator and IMP wiggler was brought into operation by the LLNL Electron Beam Group and power injected into the tokamak during an experimental run in the Fall, 1989. Following an upgrade by the MTX group, a second experimental run was made lasting from the Winter, 1992 through the end of the experiment. Significant contributions to the ECRH experiments were made by the Japan Atomic Energy Research Institute (JAERI). DOE

TIME-RESOLVED DIAGNOSTICS OF EXCIMER LASER-GENERATED ABLATION PLASMAS USED FOR PULSED LASER DEPOSITION
D. B. Geohegan 1994 37 p Presented at the NATO Advanced Study Institute: Linking the Gaseous and Condensed Phases of Matter - the Behavior of Slow Electrons, Patras, Greece, 5-18 Sep. 1993
(Contract DE-AC05-84OR-21400)
(DE94-018950; CONF-930993-4) Avail: CASI HC A03/MF A01

Characteristics of laser plasmas used for pulsed laser deposition (PLD) of thin films are examined with four in situ diagnostic techniques: Optical emission spectroscopy, optical absorption spectroscopy, ion probe studies, and gated ICCD (intensified charge-coupled-device array) fast photography. These four techniques are complementary and permit simultaneous views of the transport of ions, excited states, ground state neutrals and ions, and hot particulates following KrF laser ablation of YBCO, BN, graphite and Si in vacuum and background gases. The implementation and advantages of the four techniques are first described in order to introduce the key features of laser plasmas for pulsed laser deposition. Aspects of the interaction of the ablation plume with background gases (i.e., thermalization, attenuation, shock formation) and the collision of the plasma plume with the substrate heater are then summarized. The techniques of fast ICCD photography and gated photon counting are then applied to investigate the temperature, velocity, and spatial distribution of hot particles generated during KrF ablation of YBCO, BN, Si and graphite. Finally, key features of fast imaging of the laser ablation of graphite into high pressure rare gases are presented in order to elucidate internal reflected shocks within the plume, redeposition of material on a surface, and formation of hot nanoparticles within the plume. STELLARATOR TRANSPORT OPTIMIZATION WITH SELF-CONSISTENT ELECTRIC FIELDS
J. F. Lyon, S. L. Painter, L. M. Kovrizhnykh, and K. Gulec 1994 5 p Presented at the European Conference on Controlled Fusion and Plasma Physics, Marseilles, France, 26 Jun. - 1 Jul. 1994
(Contract DE-AC05-84OR-21400)
(DE94-019151; CONF-940635-16) Avail: CASI HC A01/MF A01

Future large stellarators will operate in the low-collisionality regime where neoclassical helical-ripple-induced transport is an important, if not dominant, element in the transport. In this regime, E x B poloidal orbit rotation can drastically change the terms in the 1-D particle and heat flow equations. Usually, values for the electron and ion densities (n(sub e)(rho) and N(sub i)(rho)) and the radial component of the electric field (E(sub r)(rho)) are assumed, and the 1-D heat flow equations are solved for the electron and ion temperatures (T(sub 0)(rho) and T(sub i)(rho)): here (rho) = r/a(sub p) is the normalized plasma radius. Previous studies assumed parabolic potential profiles (E(sub r) is proportional to (rho)) for different assumed profiles for n(rho). Solutions with negative electric field led to a lower temperature and higher density than those with positive electric field, but required more initial hearing to reach ignition. No solutions were possible for some choices of parameters. In this paper, steady-state (1-D) integral-differential equations for the heat and particle fluxes for the ions (D,T) and electrons are solved for n(sub e)(r), n(sub i)(r), T(sub e)(r), T(sub i)(r), and E(sub r)(r). The electric field is determined from the ambipolarity condition. The electric field E enters both through an E/B drift term in the denominators of (chi) and D, and directly through the sign-dependent (del)(phi) term. The volumetric heat sources (and sinks) are the usual alpha-particle hearing, electron-ion heat transfer, and radiation terms. The form for the particle source rate (s) is chosen to represent shallow or deep fueling of the plasma. DOE

QUASI-LINEAR EQUATION FOR MAGNETOPLASMA OSCILLATIONS IN THE WEAKLY RELATIVISTIC APPROXIMATION M.S. Thesis

F. B. Rizzato 1985 87 p

(DE94-628932; INIS-BR-3340) Avail: CASI HC A05/MF A01 (US Sales Only)

Some limitations which are present in the dynamical equations for collisionless plasmas are discussed. Some elementary corrections to the linear theories are obtained in a heuristic form, which directly lead to the so-called quasi-linear theories in its non-relativistic and relativistic forms. The effect of the relativistic variation of the gyrofrequency on the diffusion coefficient is examined in a typically perturbative approximation. DOE

ATOMIC PROCESSES IN PROCESSING PLASMAS

M. E. Riley, G. A. Hebner, and K. E. Greenberg 1994 4 p Presented at the Department of Energy Basic Energy Sciences Atomic Physics Workshop, Lexington, KY, 14-15 Oct. 1994

(Contract DE-AC04-94AL-85000)

(DE94-019177; SAND-94-2332C; CONF-9410198-1) Avail: CASI HC A01/MF A01

The goal of this project is to gain an understanding of the fundamental mechanisms and processes occurring in low pressure, partially ionized plasmas and their interactions with materials. Emphasis is placed on: understanding the basic atomic and molecular physics that is occurring within the plasma bulk and sheath, understanding the relation of the collective plasma dynamics to the internal atomic processes, developing the ability to perform computer simulations of the plasmas as to both collective dynamics and inclusion of atomic properties, and analyzing the response of the materials to the plasma and how the plasma might be tailored to obtain a given effect at the material surface. THE ITER IN-VESSEL SYSTEM

D. C. Lousteau 1994 8 p Presented at the 11th Topical Meeting on the Technology of Fusion Energy, New Orleans, LA, 19-24 Jun. 1994

(Contract DE-AC05-84OR-21400)

(DE94-018053; CONF-940630-44) Avail: CASI HC A02/MF A01

The overall programmatic objective, as defined in the ITER Engineering Design Activities (EDA) Agreement, is to demonstrate the scientific and technological feasibility of fusion energy for peaceful purposes. The ITER EDA Phase, due to last until July 1998, will encompass the design of the device and its auxiliary systems and facilities, including the preparation of engineering drawings. The EDA also incorporates validating research and development (R&D) work, including the development and testing of key components. The purpose of this paper is to review the status of the design, as it has been developed so far, emphasizing the design and integration of those components contained within the vacuum vessel of the ITER device. The components included in the in-vessel systems are divertor and first wall; blanket and shield; plasma heating, fueling, and vacuum pumping equipment; and remote handling equipment. DOE

INTENSE PROTON BEAM SOURCE FOR ITER NEUTRAL-BEAM SPECTROSCOPY DIAGNOSTICS

R. R. Bartsch, H. A. Davis, I. Henins, and J. B. Greenly (Cornell Univ., Ithaca, NY.) 1994 7 p Presented at the 10th International Conference on High Power Particle Beams, San Diego, CA, 20-24 Jun. 1994

(Contract W-7405-eng-36)

(DE94-018092; LA-UR-94-2559; CONF-940634-17) Avail: CASI HC A02/MF A01

An intense proton beam has been developed to evaluate a gas-cell neutralizer for use in an intense-neutral beam source for Tokomak Spectroscopy diagnostics. The allowed energy range of the proton stream is determined to be 50 to 70 keV from neutralization and reionization cross-sections and from the alpha particle charge exchange recombination intensity as a function of energy (baseline diagnostic). The neutralization evaluation source uses a flashover anode, magnetized, ion-diode. Neutral probes sensitive to energetic atomic and molecular hydrogen, developed to evaluate neutralizer performance, show neutral fluence from the ion-diode during the beam pulse. An array of Rogowski current probes, used to study the evolution of the current path, suggests that expansion of the anode plasma along the radial insulating magnetic field leads to impedance collapse. DOE

EVALUATION OF PUMPING AND FUELING REQUIREMENTS FOR THE ITER EDA

W. A. Houlberg and S. E. Attenberger 1994 21 p Presented at the 11th Topical Meeting on the Technology of Fusion Energy, New Orleans, LA, 19-24 Jun. 1994

(Contract DE-AC05-84OR-21400)

(DE94-018117; CONF-940630-43) Avail: CASI HC A03/MF A01

The relationships between fueling (gas injection and pellets of various sizes and velocities), pumping in the divertor chamber (constrained by fuel processing and divertor design), core density (constrained by the desired fusion power and helium ash accumulation), separatrix density (constrained by divertor operation and density limits) and plasma confinement models are examined for the International Engineering Tokamak Reactor (ITER) Engineering Design Activity (EDA) for guidance in the definition of design requirements for the pumping and fueling systems. Various combinations of gas and pellet injection are found to meet the constraints for operation at 1,500 MW of fusion power and 1 bar(center dot)l/s (5.3 x 10(exp 22) atoms/s) of DT pumping. Very low pumping reduces fuel processing requirements, but can lead to excessive helium accumulation depending on the particle transport properties. Isotopic tailoring of the fuel sources, e.g., 20-30% of the input fuel stream as tritium pellets and the rest as deuterium gas, can maintain the core fuel species mixture in the optimum range for fusion production (at least a 40-60 mixture) while reducing the tritium concentration in the edge region to 20-30%. This should reduce the tritium inventory in the plasma facing components, since that is typically governed by the fuel density mix near the plasma edge. A high density, low temperature ignited regime supported by deep pellet injection is shown to exist under some low confinement conditions. DOE

JOULE HEATING OF THE ITER TF COLD STRUCTURE: EFFECTS OF VERTICAL CONTROL COIL CURRENTS AND ELMS

A. Radovinsky and R. D. Pillsbury, Jr. Nov. 1993 55 p

(Contract DE-FC02-93ER-54186)

(DE95-001817; DOE/ER-54186/T2; PFC/RR-93-7) Avail: CASI HC A04/MF A01

The toroidal field coil and support structures for ITER are maintained at cryogenic temperatures. The time-varying currents in the poloidal field coil system will induce eddy currents in these structures. The associated Joule dissipation will cause local heating and require heat removal which will show up as a load on the cryogenic system. Studies of Joule heating of the ITER TF cold structure (TFCS) due to the currents in the poloidal field coil system are presented. The two regimes considered in this study are the plasma vertical stability control and the Edge Loss Mode (ELM) events. The 3-D, thin-shell, eddy current program, EDDYCUFF was used to analyze the eddy currents and Joule losses in the cold structure. The current versus time scenarios were defined. Four control coil options were studied. All schemes use coils external to the TF cold structure. Analyses of power depositions during the plasma vertical stability control were performed for each of the four options. For each of these options three different recovery times were assumed. The times were 3, 1, and 1/3 seconds. Sets of four sequential ELMs, as well as isolated ELM's have been studied for various sets of active PF coils. The results showed that the lowest average power dissipation in the TF cold structure occurs when a subset of PF2 and PF7 are active, and all the other PF coils are passive. The general conclusion is that to minimize power dissipation in the TF cold structure it is preferable that only coils PF2 and PF7 are active. The other coils (PF3-PF6) should be passive and driven by a condition of constant flux. It is recommended in particular, that coils PF3 and PF5 be allowed to change currents to conserve flux, since they provide the maximum shielding of the TFCS from the fields caused by the active coils. DOE

COLLISIONAL DRIFT WAVES IN THE H-MODE EDGE
S. Sen Jan. 1994 17 p
(DE94-628950; IC-94/41) Avail: CASI HC A03/MF A01 (US Sales Only)

The stability of the collisional drift wave in a sheared slab geometry is found to be severely restricted at the H-mode edge plasma due to the very steep density gradient. However, a radially varying transverse velocity field is found to play the key role in stability. Velocity profiles usually found in the H-mode plasma stabilize drift waves. On the other hand, velocity profiles corresponding to the L-mode render collisional drift waves unstable even though the magnetic shear continues to play its stabilizing role. DOE

A SYNCOPATED LEAP-FROG ALGORITHM FOR ORBIT CONSISTENT PLASMA SIMULATION OF MATERIALS PROCESSING REACTORS
J. W. Cobb and J. N. Leboeuf 1994 5 p Presented at the 15th International Conference on the Numerical Simulation of Plasmas, Valley Forge, PA, 7-9 Sep. 1994
(Contract DE-AC05-84OR-21400)
(DE95-000954; CONF-9409105-4) Avail: CASI HC A01/MF A01

The authors present a particle algorithm to extend simulation capabilities for plasma based materials processing reactors. The orbit integrator uses a syncopated leap-frog algorithm in cylindrical coordinates, which maintains second order accuracy, and minimizes computational complexity. Plasma source terms are accumulated orbit consistently directly in the frequency and azimuthal mode domains. Finally they discuss the numerical analysis of this algorithm. Orbit consistency greatly reduces the computational cost for a given level of precision. The computational cost is independent of the degree of time scale separation. DOE

CURRENT STATUS OF FUSION-RELEVANT COVARIANCE DATA
D. W. Muir 12 Sep. 1994 6 p Presented at the Improved Evaluations and Integral Data Testing for FENDL, Garching, Germany, 12-16 Sep. 1994
(Contract W-7405-eng-36)
(DE95-000865; LA-UR-94-3105; CONF-9409221-2) Avail: CASI HC A02/MF A01

The following review of the current status of formatted data covariance files and their multigroup processing is a contribution to the IAEA Advisory Group Meeting on 'Improved Evaluations and Integral Data Testing for FENDL,' to be held at the Max-Planck-Institut fuer Plasmaphysik, Garching, Germany, 12-16 September 1994. The draft agenda of this meeting lists as Item 6 the 'assessment of present status and role of uncertainty files, their processing and sensitivity studies related to FENDL.' We conclude that this is an important and timely topic and recommend needed actions in this field. DOE

ADVANCED DIAGNOSTICS FOR PLASMA CHEMISTRY
Charles H. Kruger Mar. 1994 13 p
(Contract DE-FG03-88ER-13957)
(DE94-018936; DOE/ER-13957/T1) Avail: CASI HC A03/MF A01

Since July 15, 1992, the High Temperature Gasdynamics Laboratory in the Department of Mechanical Engineering at Stanford University has been engaged in a four-year research program on Advanced Diagnostics for Plasma Chemistry. The goal of this program is to develop state-of-the-art laser-based diagnostics of molecular species in harsh chemical environments, particularly those encountered in plasma synthesis of new materials. Emphasis has been placed on exploiting a new nonlinear spectroscopy, degenerate four wave mixing, as well as linear laser induced fluorescence to accomplish these goals. The present submittal is a proposal for the continuation funding for the third year of this program, from July 15, 1994, until July 14, 1995. Section 2 summarizes the research accomplished during the first eighteen months of the program. Section 3 discusses the plans for continuing research activities. Publications and presentations to date resulting from this program are listed in Section 4. The proposed budget for the third year is given in Section 5. DOE

MEASUREMENTS OF THE AUBURN ECE OPTICAL SYSTEM PARAMETERS FOR TEMPERATURE FLUCTUATION MEASUREMENTS ON TEXT-U
M. Koltonyuk (Columbia Univ., New York, NY.) and C. Watts 29 Aug. 1994 14 p
(Contract DE-FG03-94ER-54241)
(DE94-019217; DOE/ER-54241/134; FRCR-449) Avail: CASI HC A03/MF A01

Calibration measurements were performed on Auburn ECE antenna system to determine the beam waist size and location at several characteristic frequencies typically used in TEXT-U experiments, and compare these with known manufacturer's specifications. A halogen bulb, acting as a microwave source, swept a grid of points in a plane parallel to antenna lens' surface. The intensity of the collected signal was recorded and later fitted to a Gaussian for several values of the radial distance from the lens, thus enabling us to estimate the beam waist size and position. Knowledge of the minimum spot size possible allows us to determine the maximum resolution in measuring the wavelength of the tilde-T(sub e) fluctuations in the plasma. Results indicate that the Auburn optical system produces the beam with the waist size bigger than was originally expected. DOE

LABORATORY CHARACTERIZATION OF WOELTER X RAY OPTICS
B. A. Remington and R. I. Morales Apr. 1994 15 p Presented at the 10th Topical Conference on High-Temperature Plasma Diagnostics, Rochester, NY, 8-12 May 1994
(Contract W-7405-eng-48)
(DE94-016969; UCRL-JC-116182; CONF-940552-28) Avail: CASI HC A03/MF A01

We have conducted an extensive series of characterization measurements of a Woelter incidence x-ray microscope. The measurements were carried out on 5% sectors of the Woelter x-ray optic in a laboratory utilizing a high brightness, 'point' x-ray source and fall into two categories. (1) Absolute reflectance measurements as a function of x-ray energy were made with Si(Li) detectors to acquire continuum spectra prior to and after reflecting off the Woelter optic. (2) Spatial resolution measurements were made using back-illuminated pinholes or grids imaged onto film or an x-ray CCD camera. The depth of field was mapped out by varying the distance between the Woelter optic and the backlit grid. DOE

HEAT LOSS BY HELICITY INJECTION IN SPHEROMAKS
T. K. Fowler 17 Mar. 1994 24 p
(Contract W-7405-eng-48)
(DE95-003473; UCRL-ID-116975) Avail: CASI HC A03/MF A01

A model is presented for spheromak buildup and decay including thermal diffusivity associated with magnetic turbulence during helicity injection. It is shown that heat loss by magnetic turbulence scales more favorably than gyroBohm transport. Thus gyroBohm scaling for the proposed ignition experiment would be the conservative choice, though present experiments may be dominated by magnetic turbulence. Because of a change in boundary conditions when the gun is turned off, the model may account for the observed increase in electron temperature in CTX after turnoff. DOE

APPLICATION OF IRIS TO SEMICONDUCTOR PLASMA PROCESSING Final Technical Report
Pauline Ho, Kevin P. Killeen, Carl F. Melius, and Richard J. Buss Nov. 1994 27 p
(Contract DE-AC04-94AL-85000)
(DE95-003591; SAND-94-2439) Avail: CASI HC A03/MF A01

This report describes technical work done at Sandia National Laboratories (SNL) under CRADA No. 1031, a Technology Transfer Initiative (TTI) collaborative project with Texas Instruments, Inc. (TI). The overall objective of the work was to improve specific semiconductor processing technologies by the use of numerical modeling and in situ sensors. On a technical level, this collaboration was very successful. The project had three parts, unequal in size. The first part involved the use of the IRIS (Imaging of Radicals Interacting with Surfaces) technique to measure the reactivities of radical species at surfaces. The second, and smallest, part of the work involved the evaluation and transfer of sensor technologies for monitoring source stability in MOCVD (metal-organic CVD) of compound semiconductors. The third part of the work involved experimental and theoretical investigations into the chemical reactions occurring during the CVD of SiO2 from TEOS (tetraethoxysilane). DOE

THE SUPERCONDUCTING MAGNET SYSTEM FOR THE TOKAMAK PHYSICS EXPERIMENT
Dwight D. Lang, R. J. Bulmer, M. R. Chaplin, T. G. OConner, D. S. Slack, R. L. Wong, J. P. Zbasnik, J. H. Schultz, N. Diatchenko, and D. B. Montgomery et al 18 Jun. 1994 9 p Presented at the 11th Topical Meeting on the Technology of Fusion Energy, New Orleans, LA, 19-24 Jun. 1994
(Contract W-7405-eng-48)
(DE94-018329; UCRL-JC-116879; CONF-940630-47) Avail: CASI HC A02/MF A01

The superconducting magnet system for the Tokamak Physics eXperiment (TPX) will be the first all superconducting magnet system for a Tokamak, where the poloidal field coils, in addition to the toroidal field coils are superconducting. The magnet system is designed to operate in a steady state mode, and to initiate the plasma discharge ohmically. The toroidal field system provides a peak field of 4.0 Tesla on the plasma axis at a plasma major radius of 2.25 m. The peak field on the niobium 3-tin, cable-in-conduit (CIC) conductor is 8.4 Tesla for the 16 toroidal field coils. The toroidal field coils must absorb approximately 5 kW due to nuclear heating, eddy currents, and other sources. The poloidal field system provides a total of 18 volt seconds to initiate the plasma and drive a plasma current up to 2 MA. The poloidal field system consists of 14 individual coils which are arranged symmetrically above and below the horizontal mid plane. Four pairs of coils make up the central solenoid, and three paris of poloidal ring coils complete the system. The poloidal field coils all use a cable-in-conduit conductor, using either niobium 3-tin (NB3Sn) or niobium titanium (NbTi) superconducting strands depending on the operating conditions for that coil. All of the coils are cooled by flowing supercritical helium, with inlet and outlet connections made on each double pancake. The superconducting magnet system has gone through a conceptual design review, and is in preliminary design started by the Lawrence Livermore National Laboratory; Massachusetts Institute of Technology; and the Princeton Plasma Physics Laboratory (LLNL/MIT/PPPL) collaboration. A number of changes have been made in the design since the conceptual design review, and are described in this paper. DOE

THE FINAL STATUS OF A METAL SURFACE AFTER MULTIPULSE LASER IRRADIATION IN AN AMBIENT GAS
C. Boulmer-Leborgne (Orleans Univ., France.), J. Hermann (Orleans Univ., France.), B. Dubreuil (Orleans Univ., France.), M. Dinescu (Academia R. P. R., Bucharest, Romania.), N. Chitica (Academia R. P. R., Bucharest, Romania.), I. N. Mihailescu (Academia R. P. R., Bucharest, Romania.), and I. Ursu Nov. 1993 14 p
(DE94-629000; IC-93/390) Avail: CASI HC A03/MF A01 (US Sales Only)

We have investigated the role of the ambient gas nature and pressure, and the influence of the laser pulse total duration and temporal shape in the coupling of the incident laser light of lambda = 10.6 micro m wavelength to a metallic surface at intermediate laser intensities of 10(exp 7) - 10(exp 8) W/sq cm. A plasma is accompanying then the action of the laser pulse. It is acting as an active moderator among laser beam and target thus determining the final status of the contact surface. DOE

PIC SIMULATION OF SURFACE WAVES Annual Report
Charles K. Birdsall 1993 2 p
(Contract N00014-93-1-1389)
(AD-A285358) Avail: CASI HC A01/MF A01

Surface waves are investigated via electrostatic particle simulation of a warm, unmagnetized, bounded 2 1/2 d plasma. The study focuses on a slab configuration in which the y direction is periodic and the x direction is bounded by grounded conducting walls. In order to further the study of surface waves as a mechanism for sustaining plasma discharges, a Monte Carlo collision code was modified to allow simulation particles to have their own variable weights. Defect characterization, identifications, and their influence on material properties and device performance are a major subject in the physics and applications of semiconductors. This volume focuses on defects in advanced semiconductors or precisely quantum wells, superlattices, and heterostructures. In Part 1 of this proceedings the invited and contributed papers deal with defects in type 1 and type 2 superlattices based on III-V semiconductors such as GaAs/AlGaAs multiple quantum wells (MQWs). Some of the topics include optical spectroscopy of defects in GaAs/AlGaAs MQWs, defects injections and diffusions in heterostructures and impurity effects on the electronic states in quantum wires and quantum dots. Part 2 deals with defects and impurities in bulk and epitaxial InP and related compounds, for example, the semi-insulating behavior of undoped InP is discussed. Recently, SiGe/Si quantum wells and heterostructures have been the subject of an increasing interest due to their applications in electronic and opto-electric devices. Defects, dislocation distributions, and doping in these heterostructures are discussed in Part 3. DTIC

MATRIX FORMULATION OF THE PARTICLE MOTION IN CRYSTALLINE BEAMS
A. F. Haffmans, D. Maletic, and A. G. Ruggiero 1994 4 p Presented at the 4th European Particle Accelerator Conference, London, England, 27 Jun. - 1 Jul. 1994
(Contract DE-AC02-76CH-00016)
(DE94-017301; BNL-49993; CONF-940618-54) Avail: CASI HC A01/MF A01

To investigate the properties of crystalline beams in their ground state, the equations of motion of a single ion and the envelope equations are derived. It is possible to express the status of motion with a set of transfer matrices associated to each of the magnet elements of the storage ring. By inspection of the eigenvalues of the total transfer matrix one then determines the onset of crystalline structures and the stability limits. An analytical approach is also possible, based on the estimate of the shifting of the frequencies of oscillation, betatron and longitudinal, and on the approaching of a major half-integral stopband resonance driven by the space charge. DOE

OPTIMIZATION OF InAsSb/InGaAs STRAINED-LAYER SUPERLATTICE GROWTH BY METAL-ORGANIC CHEMICAL VAPOR DEPOSITION FOR USE IN INFRARED EMITTERS
R. M. Biefeld, K. C. Baucom, D. M. Follstaedt, and S. R. Kurtz 1994 5 p Presented at the 21st International Symposium on Compound Semiconductors, San Diego, CA, 18-22 Sep. 1994
(Contract DE-AC04-94AL-85000)
(DE94-016557; SAND-94-0864C; CONF-940981-1) Avail: CASI HC A01/MF A01

We have prepared InAsSb/InGaAs strained-layer superlattices (SLSs) by metal-organic chemical vapor deposition using a variety of growth conditions. Presence of an InGaAsSb interface layer was indicated by x-ray diffraction. This interface effect was minimized by optimizing the purge times, reactant flows, and growth conditions. The optimized growth conditions involved the use of low pressure, short purge times between the growth of the layers, and no reactant flow during the purges. Electron diffraction indicates that CuPt-type compositional ordering occurs in InAs(sub 1 - x)Sb(sub x) alloys and SLSs which explains an observed bandgap reduction from previously accepted alloy values. DOE

HIGH PRECISION TRACE NEUTRON TRANSMUTATION DOPING OF DETECTOR-GRADE HIGH RESISTANCE ZONE-REFINED SILICON MONO-CRYSTAL
Bingxian Chen (Academia Sinica, Beijing, China.), Jijin Gao (Academia Sinica, Beijing, China.), Xiuqing Gao (Academia Sinica, Beijing, China.), Heqin Dong (Academia Sinica, Beijing, China.), and Shiling Li (Academia Sinica, Beijing, China.) Aug. 1993 8 p
(DE94-631463; CNIC-00776; IAE-0122) Avail: CASI HC A02/MF A01 (US Sales Only)

The technique of high precision trace neutron transmutation doping of detector grade high resistance zone-refined Si mono-crystal is introduced. The key technique is to precisely control the doping element. It includes the determination of rho(sub 0) value according to theoretical calculation and experimental results, the selection of irradiation channel and improvement of irradiation devices, the regulation of doping coefficient K, the simulation experiment of silicon crystal, strict control of irradiation time and the study on mechanism of radiation damage and its elimination. The developed N-type (10 approx. 100) k(Omega)cm NTD FZ Si has excellent uniformity of specific resistance, long life of minority carrier and high-purity of the crystal. DOE

CRYSTALLINE BEAM IN A STORAGE RING: HOW LONG CAN IT LAST?
Xiao-Ping Li (Biosym Technologies, Inc., San Diego, CA.), A. M. Sessler (Lawrence Livermore National Lab., Livermore, CA.), and Jie Wei 1994 4 p Presented at the 4th European Particle Accelerator Conference, London, England, 27 Jun. - 1 Jul. 1994
(Contract DE-AC02-76CH-00016)
(DE94-017303; BNL-49852; CONF-940618-53) Avail: CASI HC A01/MF A01

The ground state of a crystalline beam in a realistic storage ring is well understood by now. No crystalline beam exists in a constant gradient storage ring, but in an alternating gradient (AG) ring crystalline beams exist at all density as long as the beam energy is smaller than the transition energy. However, since the Hamiltonian is time dependent, the total energy of the beam is not a constant of motion. As a result, the crystalline beam will gradually heat up and eventually melt if not refrigerated. Here, we show that if the frequency due to the AG lattice is lower than twice the betatron frequency, heat will transfer into the system extremely fast so that a crystalline beam can not last a meaningful period of time (except at very low density). On the other hand, if the AG lattice frequency is higher than twice the betatron frequency, the heat transfer is slow, and the crystalline beam can last for a long time. We therefore arrive at the conclusion that in order for a crystalline beam to be conveniently observed, the storage ring should be designed such that the AG lattice frequency is as high as possible while the betatron frequency is kept as low as possible. OBrien (Texas Univ., Austin, TX.) et al 1994 4 p Presented at the 10th International Conference on Positron Annihilation, Beijing, China, 23-29 May 1994
(Contracts W-31-109-eng-38; DE-FG02-84ER-45170)
(DE94-018371; ANL/CHM/CP-83942; CONF-9405170-7) Avail: CASI HC A01/MF A01

The positron lifetimes of two organic superconductors, (kappa)-(ET)(sub 2)Cu(NCS)(sub 2) and (kappa)-(ET)(sub 2)Cu(N(CN)(sub 2))Br, are measured as a function of temperature across (Tc). A drop of positron lifetime below (Tc) is observed. Positron-electron momentum densities are measured by using 2D-ACAR to search for the Fermi surface in (kappa)-(ET)(sub 2)Cu(N(CN)(sub 2))Br. Positron density distributions and positron-electron overlaps are calculated by using the orthogonalized linear combination atomic orbital (OLCAO) method to interprete the temperature dependence due to the local charge transfer which is inferred to relate to the superconducting transition. 2D-ACAR results in (kappa)-(ET)(sub 2)Cu(N(CN)(sub 2))Br are compared with theoretical band calculations based on a first-principles local density approximation. Importance of performing accurate band calculations for the interpretation of positron annihilation data is emphasized. DOE

GENERATION OF MICRO-DOMAINS IN AT-CUT QUARTZ BY THERMAL PROCESSING AND THE EFFECT ON RESONATOR MODES
L. Weisenback, S. J. Martin, G. C. Frye, T. V. Bohuszewicz, and D. H. Doughty 1994 5 p Presented at the Annual Frequency Control Symposium, Boston, MA, 1-3 Jun. 1994
(Contract DE-AC04-94AL-85000)
(DE94-017344; SAND-94-0165C; CONF-9406199-2) Avail: CASI HC A01/MF A01

The fabrication of acoustic sensors with sol-gel selective coatings requires the deposition of thin films on quartz resonators using solution chemistry techniques. Oxide films are spin-cast, then heat treated. A variety of film compositions are deposited, requiring a variety of firing schedules. Network analysis of the untreated AT-cut quartz devices revealed a resonant frequency of 5.0 MHz, corresponding to a pure thickness-shear mode resonance. For devices that were rapidly fired to 400 C and rapidly air cooled, network analysis showed the shear-mode response at 5.0 MHz disappeared, while a predominantly compressional mode response at 7.3 MHz emerged. Structural analysis explored the crystal structure changes induced by processing which resulted in this new mode. DOE

CARRIER DOPING AND INTERLAYER COUPLING IN HTSC SINGLE CRYSTALS
K. Kishio (Tokyo Univ., Japan.), J. Shimoyama (Tokyo Univ., Japan.), T. Kimura (Tokyo Univ., Japan.), Y. Kotaka (Tokyo Univ., Japan.), K. Kitazawa (Tokyo Univ., Japan.), K. Yamafuji (Kyushu Univ., Fukuoka, Japan.), Q. Li, and M. Suenaga 1994 5 p Presented at the Meeting on Materials and Mechanisms of Superconductivity: High Temperature Superconductors, Grenoble, France, 4-9 Jul. 1994
(Contract DE-AC02-76CH-00016)
(DE94-018637; BNL-60756; CONF-940701-20) Avail: CASI HC A01/MF A01

Experimental results of the effect of carrier doping on the irreversibility lines in (La,Sr)2CuO(4-delta) and Bi2Sr2CaCu2O(8+delta) single crystals are summarized. As a function of Sr or oxygen contents, systematic and dramatic widening of the irreversible regions in the B - T phase diagram was observed in both systems. The present study suggests the critical importance of carrier concentration which directly affects the interlayer coupling strength and dimensionality of the flux line lattice in all the layered HTSC compounds as a universal feature. CHIRAL SYMMETRY AND LATTICE GAUGE THEORY
M. Creutz Aug. 1994 12 p Presented at the International Conference on Quark Confinement and the Hadron Spectrum, Como, Italy, 20-24 Jun. 1994
(Contract DE-AC02-76CH-00016)
(DE94-018676; BNL-60750; CONF-9406111-1) Avail: CASI HC A03/MF A01

The problem of formulating chiral symmetry in lattice gauge theory is reviewed. Recent approaches involving an infinite tower of additional heavy states to absorb fermion doublers are discussed. For hadronic physics this provides a natural scheme for taking quark masses to zero without requiring a precise tuning of parameters. A mirror fermion variation provides a possible way of extending the picture to chirally coupled light fermions. DOE

THE MODIFIED EMBEDDED ATOM METHOD
M. I. Baskes 1994 13 p Presented at the American Society of Mechanical Engineers' Winter Annual Meeting, Chicago, IL, 9-11 Nov. 1994
(Contract DE-AC04-94AL-85000)
(DE94-015746; SAND-94-8704C; CONF-941142-16) Avail: CASI HC A03/MF A01

Recent modifications have been made to generalize the Embedded Atom Method (EAM) to describe bonding in diverse materials. By including angular dependence of the electron density in an empirical way, the Modified Embedded Atom Method (MEAM) has been able to reproduce the basic energetic and structural properties of 45 elements. This method is ideal for examining interfacial behavior of dissimilar materials. This paper explains in detail the derivation of the method, shows how parameters of MEAM are determined directly from experiment or first principles calculations, and examine the quality of the reproduction of the database. Materials with fcc, bcc, hcp, and diamond cubic crystal structure are discussed. A few simple examples of the application of the MEAM to surfaces and interfaces are presented. Calculations of pullout of a SiC fiber in a diamond matrix as a function of applied stress show nonuniform deformation of the fiber. DOE

NONLINEAR FARADAY EFFECT IN CdS SEMICONDUCTOR IN AN ULTRAHIGH MAGNETIC FIELD
V. V. Druzhinin, O. M. Tatsenko, and A. I. Bykov et al 1994 8 p Presented at the 4th International Symposium on Research in High Magnetic Fields, Nijmegen, Netherlands, 29-31 Aug. 1994
(Contract DE-AC08-93NV-11265)
(DE94-016804; EGG-11265-2051; CONF-940831-2) Avail: CASI HC A02/MF A01

A significant nonlinearity in the angle of rotation polarization plane was observed in CdS at wavelengths of 494 in the presence of high magnetic fields (0.5-5 MG). The onset significant nonlinearity also depended on sample temperature. An absorption study with probe wavelength of approximately 494 nm revealed an increase in optical transmission associated with a splitting of the conduction band. Dispersion, field and temperature curves indicate a low conduction electron mass m(sub e) = 0.3 m(sub o). A numerical calculation and interpretation of the observed effects was carried out using band theory. The optical and magnetooptical properties of semiconducting crystals of CdS were studied. This article describes joint American-Russian experiments to study the optical and magnetooptical properties of CdS in ultrahigh fields to approximately 7 MG. DOE

PROPERTIES OF MOLECULAR SOLIDS AND FLUIDS AT HIGH PRESSURE AND TEMPERATURE
R. D. Etters Jun. 1994 7 p
(Contract DE-FG02-86ER-45238)
(DE94-017594; DOE/ER-45238/7) Avail: CASI HC A02/MF A01

The main thrust of this work was directed to the task of determining the thermodynamic behavior of condensed solids and fluids containing simple molecules. Properties calculated include specific heats, equations of state, compressibilities, sound velocities, virial coefficients, viscosities, and thermal expansion. In addition, details of the structural, orientational, and magnetic phase transitions were determined. Dynamical quantities calculated include the lattice, libron, and vibron mode frequencies at various pressures and temperatures. Also, we developed new techniques required to meet our objectives. One was a method for accurately calculating the Gibbs free energy of various phases. Another is the multiple-histogram Monte Carlo which can dramatically reduce computing time and can provide a continuous map of thermodynamic averages over a range of some thermodynamical variable. SIMULATIONS OF THE DISLOCATION ARRAY AT Ge/Si INTERFACES
T. Kaplan, M. F. Chisholm, and M. Mostoller Dec. 1993 5 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract DE-AC05-84OR-21400)
(DE94-017680; CONF-931108-104) Avail: CASI HC A01/MF A01

When Ge is grown epitaxially on Si(001), the 4% mismatch between the lattice parameters of Ge and Si can produce a regular two-dimensional grid of (a/2) (1,+/-1,0) edge dislocations at the interface, a checkerboard with a spacing of approximately 100 Angstrom. We have performed classical molecular dynamical simulations of this checkboard in large microcrystals. Results show the expected 5-fold plus 7-fold ring structure at the cores of the individual dislocations, and a new closed symmetric structure of 18 atoms at their intersections. Tetrahedral coordination is everywhere retained, with relatively small changes in the bond lengths of less than 10 and in the bond angles of less than 25%. The energetics and dislocation offset of the system are explored for the Stillinger-Weber and Tersoff potentials. DOE

SURFACE STRESS, MORPHOLOGICAL DEVELOPMENT, AND DISLOCATION NUCLEATION DURING STRAINED-LAYER EPITAXY
D. E. Jesson, S. J. Pennycook, J. M. Baribeau (National Research Council of Canada, Ottawa, Ontario.), and D. C. Houghton (National Research Council of Canada, Ottawa, Ontario.) Dec. 1993 7 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract DE-AC05-84OR-21400)
(DE94-017682; CONF-931108-108) Avail: CASI HC A02/MF A01

Utilizing marker layer experiments and Z-contrast imaging, we have observed the formation of surface cusps during Si(x)Ge(1-x) alloy growth. The formation of cusps can be understood in terms of stress-driven surface diffusion, and we consider the large stress build-up at the cusp tip as a potential source for the nucleation of misfit dislocations. LIGHT OUTPUT AND RADIATION DAMAGE IN A LEAD TUNGSTATE CRYSTAL
J. A. Kierstead, S. P. Stoll, and C. L. Woody 1994 7 p Presented at the Spring Meeting of the Materials Research Society, San Francisco, CA, 4-8 Apr. 1994
(Contract DE-AC02-76CH-00016)
(DE94-016814; BNL-60591; CONF-940411-49) Avail: CASI HC A02/MF A01

The optical absorption, light output and effects of radiation damage have been studied in a 2.2 x 2.2 x 12.8 cm(exp 3) crystal of lead tungstate. The crystal exhibits a longitudinal attenuation length which varies from roughly 13 cm to 1.5 m over the region where the scintillation emission occurs (400--800 nm). The light yield produces approximately 10 photoelectrons per MeV on a photomultiplier tube with a bialkali photocathode. The scintillation and light transmission properties of the crystal were characterized before and after exposure to 1 Mrad of C-60O gamma rays. Significant radiation induced optical absorption was observed in this crystal, along with a considerable amount of phosphorescence after irradiation. Partial spontaneous recovery from the damage occurred at room temperature, and it was possible to induce additional recovery by optical bleaching. DOE

IMPEDANCE CHARACTERISTICS OF MULTISTAGE ION DIODES
M. Desjarlais 1994 5 p Presented at the 10th International Conference on High Power Particle Beams, San Diego, CA, 20-24 Jun. 1994
(Contract DE-AC04-94AL-85000)
(DE94-018887; SAND-93-3893C; CONF-940634-20) Avail: CASI HC A01/MF A01

We further develop a theory of multistage diodes that includes the possibility of emission of ions in the final stage. The exact solutions are extremely cumbersome and are not practical for most applications. We have developed approximate solutions that are very accurate, require no integrations, and may be rapidly calculated using a simple iterative scheme. These solutions for the total current as a function of voltage are used in time-dependent modeling of a two-stage diode. DOE

ENHANCED IONIC CONDUCTION AT THE FILM/SUBSTRATE INTERFACE IN LiI THIN FILMS GROWN ON SAPPHIRE(0001)
D. Lubben and F. A. Modine Dec. 1993 7 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract DE-AC05-84OR-21400)
(DE94-017884; CONF-931108-107) Avail: CASI HC A02/MF A01

The ionic conductivity of LiI thin films grown on sapphire(0001) substrates has been studied in-situ during deposition as a function of film thickness and deposition conditions. LiI films were produced at room temperature by sublimation in an ultra-high-vacuum system. The conductivity of the LiI parallel to the film/substrate interface was determined from frequency-dependent impedance measurements as a function of film thickness using Au interdigital electrodes deposited on the sapphire surface. The measurements show a conduction of (approximately)5 times the bulk value at the interface which gradually decreases as the film thickness is increased beyond 100 nm. This interfacial enhancement is not stable but anneals out with a characteristic log of time dependence. Fully annealed films have an activation energy for conduction (sigma)T of (approximately)0.47 +/- .03 eV, consistent with bulk measurements. The observed annealing behavior can be fit with a model based on dislocation motion which implies that the increase in conduction near the interface is not due to the formation of a space-charge layer as previously reported but to defects generated during the growth process. This explanation is consistent with the behavior exhibited by CaF2 films grown under similar conditions. DOE

ENERGY GAP STRUCTURE OF LAYERED SUPERCONDUCTORS
S. H. Liu and R. A. Klemm (Argonne National Lab., IL.) Dec. 1993 13 p Presented at the OE/LASE 1994: Conference on Optics, Electro-Optics, and Laser Applications in Science and Engineering, Los Angeles, CA, 22-29 Jan. 1994
(Contracts DE-AC05-84OR-21400; W-31-109-eng-38)
(DE94-017885; CONF-940142-45) Avail: CASI HC A03/MF A01

We report the energy gap structure and density-of-states (DOS) of a model layered superconductor with one superconducting layer and one normal layer in a unit cell along the c-axis. In the physically interesting parameter range where the interlayer hopping strengths of the quasiparticles are comparable to the critical temperature, the peaks in the DOS curve do not correspond to the order parameter (OP) of the superconducting layer, but depend on the OP and the band dispersion in the c-direction in a complex manner. In contrast to a BCS superconductor, the DOS of layered systems have logarithmic singularities. Our simulated tunneling characteristics bear close resemblance to experimental results. DOE

Different Monte Carlo schemes for modeling positron and electron implantation in solids have been briefly reviewed. Results (mean depth, backscattered fraction, profile shapes) of the Monte Carlo schemes are compared with experimental data and each other. Qualitatively, results of the different Monte Carlo schemes are the same; the most significant difference is in the value of the mean implantation depth. The scaled profiles (for positron implantation in any material) generated by the different Monte Carlo schemes can be superimposed on a universal curve which can be appropriately parameterized. Shapes of the scaled profiles, and the mean depth parameters A and n, are found to be material-dependent. DOE

MEAN FIELD ANALYSIS OF ORIENTATION SELECTIVE GRAIN GROWTH DRIVEN BY INTERFACE-ENERGY ANISOTROPY
J. A. Floro and C. V. Thompson (Massachusetts Inst. of Tech., Cambridge, MA.) 1994 6 p Presented at the Spring Meeting of the Materials Research Society, San Francisco, CA, 4-8 Apr. 1994
(Contract DE-AC04-94AL-85000)
(DE94-015797; SAND-94-0360C; CONF-940411-45) Avail: CASI HC A02/MF A01

Abnormal grain growth is characterized by the lack of a steady state grain size distribution. In extreme cases, the size distribution becomes transiently bimodal, with a few grains growing much larger than the average size. This is known as secondary grain growth. In polycrystalline thin films, the surface energy gammas and film/substrate interfacial energy gammas vary with grain orientation, providing an orientation-selective driving force that can lead to abnormal grain growth. We employ a mean field analysis that incorporates the effect of interface energy anisotropy to predict the evolution of the grain size/orientation distribution. While abnormal grain growth and texture evolution always result when interface energy anisotropy is present, whether secondary grain growth occurs will depend sensitively on the details of the orientation dependence of (gamma)i. CHARACTERISTICS OF OXYNITRIDES GROWN IN N2O
N. S. Saks (Naval Research Lab., Washington, DC.), D. I. Ma (Naval Research Lab., Washington, DC.), M. E. Twigg (Naval Research Lab., Washington, DC.), and D. M. Fleetwood 1994 10 p Presented at the 185th Electrochemical Society Meeting, San Francisco, CA, 22-27 May 1994
(Contract DE-AC04-94AL-85000)
(DE94-015798; SAND-94-1742C; CONF-940529-22) Avail: CASI HC A02/MF A01

MOS oxides have been fabricated by oxidation of silicon in N2O. Processes studied include oxidation in N2O alone, and two-step oxidation in O2 followed by N2O. For both oxides, a nitrogen-rich layer with a peak N concentration of approximately 0.5 at. % is observed at the Si-SiO2 interface with SIMS. Electrical characteristics of N2O oxides, such as breakdown and defect generation, are generally improved, especially for the two-step process. Drawbacks typically associated with NH3-nitrided oxides such as high fixed oxide charge and enhanced electron trapping, are not observed in N2O oxides, which is probably due to their smaller nitrogen content. DOE

We have developed a hybrid, parallel computer code for calculating the electronic structure of both ordered and substitutionally disordered materials. By using PVM3.3, we can integrate into our local computer environment multiple parallel and vector supercomputers as well as high performance workstations. Without this approach, calculations of materials properties of large systems would be otherwise untenable due to a lack of computer resources. For example, we have determined the short-range order intensity and its electronic origin for the Ag-Mg alloy system, including an estimate of the order-disorder (spinodal) temperature. DOE

A MECHANISTIC MODEL FOR RADIATION-INDUCED CRYSTALLIZATION AND AMORPHIZATION IN U3Si
J. Rest Jun. 1994 16 p Presented at the 17th Symposium on Effects of Radition on Materials, Sun Valley, ID, 20-23 Jun. 1994
(Contract W-31-109-eng-38)
(DE94-015028; ANL/ET/CP-83313; CONF-940657-2) Avail: CASI HC A03/MF A01

Radiation-induced amorphization is assessed. A rate-theory model is formulated wherein amorphous clusters are formed by the damage event. These clusters are considered centers of expansion (CE), or excess-free-volume zones. Simultaneously, centers of compression (CC) are created in the material. The CC's are local regions of increased density that travel through the material as an elastic (e.g., acoustic) shock wave. The CE's can be annihilated upon contact with CC's (annihilation probability depends on height of the energy barrier), forming either a crystallized region indistinguishable from the host material, or a region with a slight disorientation (recrystallized grain). Recrystallized grains grow by the accumulation of additional CC's. Full amorphization is calculated on the basis of achieving a fuel volume fraction consistent with the close packing of spherical entities. Amorphization of a recrystallized grain is hindered by the grain boundary. Preirradiation of U3Si above the critical temperature for amorphization results in nanometer-size grains. Subsequent reirradiation of these samples at temperatures below the critical level shows that the material has developed a resistance to radiation-induced amorphization (that is, a higher dose is needed to amorphize the preirradiated samples than for those that have not been preirradiated). In the model, it is assumed that grain boundaries act as effective defect sinks, and that enhanced defect annihilation is responsible for retarding amorphization at low temperature. The calculations have been validated against data from ion-irradiation experiments with U3Si. To obtain additional validation, the model has also been applied to the ion-induced motion of the interface between crystalline and amorphous phases of U3Si. Results of this analysis are compared to data and results of calculations for ion bombardment of Si. DOE

SPIN-SPECIFIC PHOTOELECTRON DIFFRACTION USING MAGNETIC X RAY CIRCULAR DICHROISM
J. G. Tobin, G. D. Waddill, X. Guo (Wisconsin Univ., Milwaukee, WI.), and S. Y. Tong (Wisconsin Univ., Milwaukee, WI.) Apr. 1994 8 p Presented at the Intermag: 6th Joint Conference on Magnetism and Magnetic Materials, Albuquerque, NM, 20-23 Jun. 1994
(Contract W-7405-eng-48)
(DE94-017527; UCRL-JC-115741; CONF-940629-9) Avail: CASI HC A02/MF A01

The first observation of spin-dependent photoelectron diffraction using circularly-polarized x-rays is reported for monolayer ferromagnetic fcc Fe films on Cu(001). Circularly polarized x-rays are used to produce spin polarized photoelectrons from the Fe 2p spin-orbit split doublet, and intensity asymmetries in the 2p3/2 level of approximately 3% are observed. The asymmetry is dependent on the relative orientation of the x-ray polarization vector and the Fe magnetic moment. This spin-dependent technique promises the direct, element-specific determination not only of local atomic structure, but magnetic structure as well. DOE

A STRUCTURAL DETERMINATION USING MAGNETIC X RAY CIRCULAR DICHROISM IN SPIN-POLARIZED PHOTOELECTRON DIFFRACTION
G. D. Waddill, J. G. Tobin, X. Guo (Wisconsin Univ., Milwaukee, WI.), and S. Y. Tong (Wisconsin Univ., Milwaukee, WI.) 26 May 1994 11 p Presented at the 4th European Vacuum Conference and the 1st Swedish Vacuum Meeting, Uppsala, Sweden, 13-17 Jun. 1994
(Contracts W-7405-eng-48; DE-FG02-84ER-45076)
(DE94-017528; UCRL-JC-117539; CONF-9406201-2) Avail: CASI HC A03/MF A01

The first structural determination with spin-polarized, energy-dependent photoelectron diffraction using circularly-polarized x-rays is reported for Fe films on Cu(001). Circularly-polarized x-rays produce spin-polarized photoelectrons from the Fe 2p doublet, and intensity asymmetries in the 2p(sup 3/2) level are observed. Fully spin-specific multiple scattering calculations reproduce the experimentally determined energy and angular dependences. A new analytical procedure which focuses upon intensity variations due to spin-dependent diffraction is introduced. DOE

THE DYNAMICS OF FORMATION AND EVAPORATION OF MIXED ALKALI HALIDE NANOCRYSTALS: A CASE OF COMPARABLE LATTICE ENERGIES
Temer S. Ahmadi and Mostafa A. El-Sayed 21 Sep. 1994 22 p Submitted for publication
(Contract N00014-89-J-1350)
(AD-A285052; TR-79) Avail: CASI HC A03/MF A01

The relative intensity distribution of the (Rb(n)K(14-n)I13)(+) mixed nanocrystals containing a 'magic' number of 14 metal cations and 13 iodide anions is examined. These nanocrystals were generated through sputtering of mixed RbI/KI solids using fast atom bombardment, and analyzed by use of a double-focusing sector-field mass spectrometer. The relative intensities of the observed peaks is found to have a 'bimodal' distribution with a maximum near n=7. This observation is explained by assuming: (1) a rate of formation that is proportional to the number of isomers that can be formed for each mixed nanocrystal, and (2) a rate of dissociation that is insensitive to the composition of the mixed nanocrystal. The later assumption leads to the conclusion that the internal energies of these mixed nanocrystals are similar and independent of their composition. The conclusion is supported by the results of Monte Carlo simulation annealing as well as by the similarity of the known lattice energies of KI and RbI bulk crystals. Author (DTIC)

AN ATOMICALLY-RESOLVED STM STUDY OF THE THERMAL DECOMPOSITION OF DISILANE ON Si(001) Interim Report, 1 Jun. 1993 - 31 May 1994

Y. Wang, J. Bronikowski, and R. J. Hamers 27 May 1994 77 p
(Contract N00014-91-J-1629)
(AD-A279818; TR-20) Avail: CASI HC A05/MF A01

Scanning Tunneling Microscopy (STM) has been used to study the adsorption and thermal dissociation of disilane (Si2H6) on the Si(001) surface. At low coverage, disilane adsorbs dissociatively to produce adsorbed SiH3 groups which are randomly distributed on the surface. STM images show that these SiH3 groups spontaneously dissociate into SiH2 and H within several minutes of adsorption at room temperature, and images depicting individual dissociation events have been obtained. Thermal annealing leads to diffusion and dissociation of the SiH2 groups through an intermediate which consists of a hydrogenated dimer which has its dimer axis parallel to those of the underlying substrate, instead of rotated. The structure and chemical identity of the intermediates are discussed in terms of the overall dissociation mechanism. Diffusion of hydrogen atoms leads to the formation of segregated surface phase of clean Si and the Si(001)-(2x1) monohydride structure, and bias-dependent STM imaging permits these species to be identified on a dimer-by-dimer basis. At low temperatures the monohydride distribution is non-statistical, showing a preference for flat terraces over small epitaxial islands. The diffusion, desorption, segregation of hydrogen and its role in blocking diffusion of silicon atom is also discussed. DTIC

Nanostructured materials are usually defined as having some length scale smaller than 100 nm in at least one dimension. An important subset of this group of materials is powders with particle size less than 100 nm, and polycrystalline materials, made by consolidating these powders in such a way as to retain a grain size below this limit. The choice of 100 nm stems from the fact that many physical, optical, and magnetic properties have characteristic lengths in this range. As grain or particle size is reduced below this characteristic length, the properties associated with these phenomena are radically altered. A frequently cited example is the freezing out of mechanisms for generating glissile dislocations. Another reason for expecting remarkable properties in nanostructured polycrystalline materials is the very high proportion of atoms at, or near, grain boundaries (as high as fifty percent or greater for grain sizes below five or ten nanometers). This leads, for example, to very rapid diffusion coupled with very short diffusion distances. DTIC

Experimental K-edge NEXAFS (near edge X ray absorption fine structure) data for solid Ne are compared with theoretical results. Seven features in the experimental spectrum that are not reproduced by the theoretical results are found to be attributable to two-electron excitations. Five of them are usual one-center excitations, but the remaining two are found to be novel two-center excitations involving resonant orbitals as opposed to the usual bound orbitals. In contrast, two-center, two-electron excitations involving only bound orbitals are found to be absent in the experimental spectrum. DTIC

(Contract N00014-91-J-1629)
(AD-A279895; TR-17-ONR) Avail: CASI HC A03

The epitaxial growth of silicon on Si(001) from disilane at 720 K has been investigated using scanning tunneling microscopy. Epitaxy occurs by island nucleation and growth, with islands nucleating preferentially at antiphase boundaries between different regions on the substrate terraces. These islands begin as a single dimer string which grows to cover the entire antiphase boundary before lateral growth begins. The islands increase in size until they meet on the surface, forming new antiphase boundaries (50% of the time) for nucleation of the next layer. We find that islands nucleated at such boundaries account for approximately 94% of the area of a growing layer, indicating that essentially all epitaxial growth at this temperature occurs by this mechanism. GROWTH, CHARACTERIZATION AND DEVICE DEVELOPMENT IN MONOCRYSTALLINE DIAMOND FILMS Quarterly Technical Report, 1 Jul. - 30 Sep. 1994
Robert F. Davis, J. T. Glass, and R. J. Nemanich Sep. 1994 28 p
(Contract N00014-93-I-0437)
(AD-A285991) Avail: CASI HC A03/MF A01

Candidate substrate materials for the pseudomorphic growth Cu films as host templates on which to subsequently deposit diamond films have been selected. The selection criteria were: (1) high diamond nucleation density as a bulk substrate; (2) low strain energy density in the interlayer material upon 100% two dimensional matching with the substrate; (3) ease of deposition of the interlayer material; and (4) low solubility at growth temperatures. The most promising interlayer materials were Ni, Si, Hf and Ti. Experimentally, the deposition of 5A of Ti on Cu increased the diamond particle density relative to bare Cu by an order of magnitude. No appreciable diffusion to Ti into Cu occurred and only a thin carbide layer was necessary for diamond nucleation. Raman spectroscopy has been employed to analyze residual compressive stress in four diamond films. The line shape analysis indicated that the Raman band is mostly Lorentzian for all four samples and that the main broadening mechanism is via life-time shortening due to scattering from Si and N impurity concentrations. The line width increased linearly as a function of peak position, indicative of a correlation between the impurities and stress. DTIC

PHOTOLUMINESCENCE UNDER PRESSURE AND ANNEALING OF NITROGEN-DOPED ZnSe
A. L. Chen, W. Walukiewicz, and E. E. Haller Jul. 1994 4 p Presented at the 22d International Conference on Physics of Semiconductors, Vancouver, British Columbia, 15-19 Aug. 1994
(Contract DE-AC03-76SF-00098)
(DE95-002355; LBL-35358; CONF-9408155-9) Avail: CASI HC A01/MF A01

The authors report photoluminescence measurement of MBE-grown nitrogen-doped ZnSe under hydrostatic stress. They determined the pressure coefficients of two separate donor-acceptor pair transitions in these samples. The results indicate that the deeper transition is caused by a localized donor that moves further into the band gap with increasing pressure, confirming that it stems from a localized donor. They also show that annealing at temperatures above 325 C produces this donor and results in compensation of the acceptor. DOE

MICROSCOPY OF STRESS-INDUCED MORPHOLOGICAL DEVELOPMENT AND DISLOCATION NUCLEATION DURING SEMICONDUCTOR EPITAXY
D. E. Jesson, K. Chen, S. J. Pennycook, J.-M. Baribeau, and D. C. Houghton Mar. 1994 3 p Presented at the Microscopy Society of America and Microbeam Analysis Society Joint Meeting, New Orleans, LA, 31 Jul. - 5 Aug. 1994
(Contract DE-AC05-84OR-21400)
(DE94-017869; CONF-940753-22) Avail: CASI HC A01/MF A01

A Z-contrast image of a Si0.5Ge0.5 layer, in which 2 monolayer Ge marker layers were inserted during growth by molecular beam epitaxy, showed cusp-like features. The stress concentration at the cusp tip will continue to accelerate rapidly; there must be some mechanism to relieve this stress, and the most obvious solution is the emission of a dislocation half loop at the cusp tip. SYNTHESIS AND CHARACTERIZATION OF (Zn(SEt)Et)10, FORMED VIA INSERTION OF SULFUR INTO Zn-C BONDS: A NEW CLASS OF WURTZITE-LIKE CLUSTER FRAMEWORK
Mark J. Hampden-Smith, D. Zeng, and Eileen Duesler 6 May 1994 14 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-1258)
(AD-A279701; TR-15) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The reaction of a toluene solution of ZnEt2 with one equivalent of sulfur (1/8 S8) results in dissolution of the sulfur to form a colorless solution. After addition of n-pentane and cooling, colorless crystals of Zn10(SEt)10Et10 were isolated and characterized by a variety of spectroscopic characterization techniques and by single-crystal X-ray diffraction. Crystallographic data for Zn10(SEt)10Et10 at 293K: space group P(bar-I), a = 12.010 (2)A, b = 14.739 (3)A, c = 20.327 (4)A, a = 99.93 (3) deg, beta = 91.62 (3) deg, gamma = 107.79 (3) deg, V = 3362.2 (11) A3, Z = 2, d(calc) = 1.636 g/cu cm, R = 9.41%, Rw = 9.00%. Although the crystal deteriorated during data collection, the structural data show that Zn10(SEt)10Et10 exhibits a unique wurtzite-like ZnS core rather than a sphalerite-like core which is more common to zinc and cadmium alkylthiolate clusters. Thermal decomposition of Zn10(SE)10Et10 was studied by diffraction methods, microscopy, thermal analysis and elemental analysis. These data are consistent with the formation of a crystalline, cubic (sphalerite) ZnS at low temperatures, 250 C, providing evidence that the structure of the molecular precursor does not direct the crystallization of a particular polymorph on solid-state thermolysis in this system. (Contract DAAB07-88-C-F421)
(AD-A286605; NV-94-C11) Avail: CASI HC A07/MF A02

This final report covers the experimental and theoretical investigations of optical power limiting in liquid crystal systems. Both pure and composite systems were investigated. Evaluation of a variety of liquid crystal materials for optical power limiting applications is reported. Under this project, optical power limiting of several pure materials was demonstrated in the nanosecond regime, with the cyanobiphenyls being found most effective for passive OPL applications. For CW lasers, polymer dispersed liquid crystals in a polymer matrix were shown to be effective optical power limiters when used in an active configuration. Extensive research on the mechanisms causing optical nonlinear response in liquid crystals is reported. Additional work on a separate subproject to evaluate and develop the shuttering capability of polymer dispersed liquid crystals in the IR is reported. Work on a variety of polymer/liquid crystal materials is reported. Successful shuttering of IR radiation was shown. Author (DTIC)

The low energy states of a beam of charged particles subject to circumferentially varying guiding and focusing forces are studied by first deriving a Hamiltonian in the rest frame of the circulating reference particle, and then using the molecular dynamics method. In an alternating gradient structure, operating below the transition energy, (but not in a constant gradient ring), the lowest state is ordered. The nature of the ground state depends upon the beam, density and the ring parameters. At very low temperature the crystal remains intact for a long time, but as temperature increases it rapidly gains energy from the lattice. In order for the crystalline beam to last a meaningful length of time, the storage ring should be designed such that the lattice periodicity of the machine is at least twice as high as the betatron frequencies. A method for activation of high resistivity, (100) texture CVD diamond films with gold, to improve low field electron emission is described. A model based on the dielectric breakdown of the diamond film is proposed and a test experiment, which consists of heating the gold layer to a point where the gold forms sub-micron spheroids on the diamond surface, is described which supports the model. The deposition of carbon and sulfur on Mo(310) is characterized with scanning Auger Microscopy. Correlation between Photoelectron emission Microscopy, scanning Auger Microscopy and Auger spectroscopy can be made, so that individual features in PEEM and SAM images can be identified by elemental composition. The initial design of a Seeded Supersonic Molecular Beam system for diamond deposition is described. DTIC

A MONTE CARLO STUDY OF THE MINUS SIGN PROBLEM IN THE t-J MODEL USING AN INTEL iPSC/860 HYPERCUBE
M. D. Kovarik and T. Barnes 1993 15 p Presented at the Mardi Gras Conference on Concurrent Computing in the Physical Sciences, Baton Rouge, LA, 18-20 Feb. 1993 Prepared in cooperation with Tennessee Univ., Knoxville, TN
(Contract DE-AC05-84OR-21400)
(DE95-001072; CONF-9302112-4) Avail: CASI HC A03/MF A01

We describe a Monte Carlo simulation of the 2-dimensional t-J model on an Intel iPSC/860 hypercube. The problem studied is the determination of the dispersion relation of a dynamical hole in the t-J model of the high temperature superconductors. Since this problem involves the motion of many fermions in more than one spatial dimensions, it is representative of the class of systems that suffer from the 'minus sign problem' of dynamical fermions which has made Monte Carlo simulation very difficult. We demonstrate that for small values of the hole hopping parameter one can extract the entire hole dispersion relation using the GRW Monte Carlo algorithm, which is a simulation of the Euclidean time Schroedinger equation, and present results on 4 x 4 and 6 x 6 lattices. We demonstrate that a qualitative picture at higher hopping parameters may be found by extrapolating weak hopping results where the minus sign problem is less severe. Generalization to physical hopping parameter values will only require use of an improved trial wavefunction for importance sampling. DOE

Khan et al Jul. 1994 19 p Presented at the Ampere Workshop on Magnetic Resonance and Microwave Absorption in the High Tc Superconducting Materials, Poznan, Poland, 10-13 Apr. 1994 Submitted for publication
(Contract DE-AC05-84OR-21400)
(DE95-001073; CONF-9404104-1) Avail: CASI HC A03/MF A01

Hg-oxide ceramic high temperature superconductors were studied with Hg-199- and Cu-63,65-NMR spectroscopy. Room temperature spectra, spin-spin and spin-lattice relaxation times of samples with different superconducting transition temperatures are presented. A spin-lattice relaxation time of T(sub 1) = 35 msec and a spin-spin relaxation time of T(sub 2) = 1.6 msec is found for the Hg-199-NMR. All samples exhibit similar characteristic powder spectra caused by an axially symmetric Hg-199 spin interaction. The isotropic value and t he anisotropy of the tensor relative to solid HgCl2 as a standard substance is estimated. Furthermore results of Cu-63,65-NMR at a temperature of 4.2 K are presented. Also this signal shows a powder line shape (for I = 3/2). DOE

PHOTOINDUCED CHARGE TRANSFER BETWEEN FULLERENES AND TiO2 SEMICONDUCTOR COLLOIDS
P. V. Kamat, I. Bedja (Quebec Univ., Trois-Riveres, Quebec.), and S. Hotchandani (Quebec Univ., Trois-Riveres, Quebec.) 1994 12 p Presented at the 185th Electrochemical Society Meeting, San Francisco, CA, 22-27 May 1994
(Contract DE-AC02-76ER-00038)
(DE95-001447; DOE/ER-00038/3707; CONF-940529-26) Avail: CASI HC A03/MF A01

A photocatalytic method has been presented to carry out one-electron reduction of C60 and C70 in 50/50 (v/v) benzene/ethanol. The fullerene reduction was carried out in colloidal TiO2 suspension using UV excitation. The charge transfer between the excited TiO2 semiconductor colloid and fullerene molecule occurs with a quantum efficiency of 13% for C70 and 24% for C60. Laser flash photolysis measurements have been carried out to elucidate the mechanism of photocatalytic reduction. DOE

REACTIVE NANOPHASE OXIDE ADDITIONS TO MELT-PROCESSED HIGH-T(SUB c) SUPERCONDUCTORS
K. C. Goretta, B. P. Brandel, M. T. Lanagan, J. Hu, D. J. Miller, S. Sengupta, J. C. Parker (Nanophase Technologies Corp., Evanston, IL.), M. N. Ali (Nanophase Technologies Corp., Evanston, IL.), and Nan Chen (Illinois Superconductor Corp., Evanston, IL.) Oct. 1994 5 p Presented at the Applied Superconductivity Conference, Boston, MA, 16-21 Oct. 1994
(Contract W-31-109-eng-38)
(DE95-001470; ANL/ET/CP-82340; CONF-941013-2) Avail: CASI HC A01/MF A01

Nanophase TiO2 and Al2O3 powders were synthesized by a vapor-phase process and mechanically mixed with stoichiometric YBa2Cu3O(x) and TlBa2Ca2Cu3O(x) powders in 20 mole % concentrations. Pellets produced from powders with and without nanophase oxides were heated in air or O2 above the peritectic melt temperature and slow-cooled. At 4.2 K, the intragranular critical current density J(sub c)) increased dramatically with the oxide additions. At 35-50 K, effects of the oxide additions were positive, but less pronounced. At 77 K, the additions decreased J(sub c), probably because of inducing a depression of the transition temperature. DOE

ATMOSPHERE INFLUENCE ON IN SITU ION BEAM ANALYSIS OF THIN FILM GROWTH
Yuping Lin, A. R. Krauss, D. M. Gruen, and R. P. H. Chang (Northwestern Univ., Evanston, IL.) 1994 23 p Presented at the International Conference on Metallurgical Coatings and Thin Films, San Diego, CA, 25-29 Apr. 1994
(Contract W-31-109-eng-38)
(DE95-001507; ANL/CHM/CP-81118; CONF-940440-6) Avail: CASI HC A03/MF A01

In situ, nondestructive surface characterization of thin-film growth processes in an environment of chemically active gas at pressures of several mTorr is required both for the understanding of growth processes in multicomponent films and layered heterostructures and for the improvement of process reproducibility and device reliability. The authors have developed a differentially pumped pulsed ion beam surface analysis system that includes ion scattering spectroscopy (ISS) and direct recoil spectroscopy (DRS), coupled to an automated ion beam sputter-deposition system (IBSD), to study film growth processes in an environment of chemically active gas, such as required for the growth of oxide, nitride, or diamond thin films. The influence of gas-phase scattering and gas-surface interactions on the ISS and DRS signal intensity and peak shape have been studied. From the intensity variation as a function of ambient gas pressure, the authors have calculated the mean free path and the scattering cross-section for a given combination of primary ion species and ambient gas. Depending on the system geometry and the combination of primary beam and background, it is shown that surface-specific data can be obtained during thin-film growth at pressures ranging from a few mtorr to approximately 1 Torr. Detailed information such as surface composition, structure, and film growth mechanism may be obtained in real-time, making ion beam analysis an ideal nondestructive, in situ probe of thin-film growth processes. SCANNING TUNNELING MICROSCOPY OF SEMICONDUCTOR SURFACES Final Report, 1 Oct. 1991 - 30 Sep. 1993
Calvin F. Quate 30 Sep. 1993 11 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-90-J-1001)
(AD-A279982; GL-5188) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

In this final report, we discuss our recent results with the structure of metals on semiconductor surfaces. In particular, we focus our study on the use of surfactants for the epitaxial growth of germanium on silicon. A surfactant, such as tellurium, reduces the interfacial energy between the Si and Ge, as well as their surface free energies to change the growth mode to layer by layer, which is necessary to epitaxial growth. In addition to this summary of technical progress, we summarize some of the important events that took place in the Ginzton Lab during the period covered by this grant. These include the introduction of the force microscope and the transfer of this technology to industrial firms in such a way that instrument's based on the designs developed under this grant are now available in commercial form. Finally, we point out that our work on microfabrication of silicon cantilevers can be extended to the construction of parallel arrays where each cantilever is operated independently. Such an array will enable a large increase in speed for the new form of lithography based on patterning silicon with the E-field on the scanning tip. Such patterning can produce lines with widths less than 0.1 micrometer. This range, beyond the limits of optical lithography, is of crucial importance to the future of silicon microcircuits. DTIC

DEVELOPMENT OF FERROELECTRIC LIQUID CRYSTALS WITH ENHANCED NONLINEAR OPTICAL PROPERTIES Final Report, 15 Jul. 1993 - 15 Apr. 1994
Kenneth E. Arnett 24 Apr. 1994 26 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F49620-93-C-0045)
(AD-A279988; DTI-156F; AFOSR-94-0324TR) Avail: CASI HC A03

During our Phase 1 research, we advanced materials synthesis and evaluation techniques needed to develop ferroelectric liquid crystals into a useful second-order nonlinear optical material. We developed a technique for determining the second-order nonlinear susceptibility by measuring the electro-optic coefficient r22 at 633 nm, using modulation frequencies between 100 KHz-100 MHz. We evaluated two specially synthesized FLCs by measuring their r22 coefficients: previously existing MX-5679 and recently synthesized W-399, both based on a nitrobenzene hyperpolarizable moiety. Results show an increasing r22 with increasing spontaneous polarization. We also partially evaluated a new FLC material, W-371, with an ortho-situated nitroaniline hyperpolarizable moiety. Since the liquid crystalline and the linear and nonlinear materials parameters FLC's have a temperature dependence, we examined existing FLC polymers for a FLC to glass phase and discovered a polymeric/FLC system that potentially could be used to reduce temperature dependent materials properties. Our FLC synthesis efforts concentrated on synthesis of Hoffman-LaRoche compounds roche 1 and roche 2. Unfortunately, we were unable to duplicate their synthesis and instead developed an alternative core that could yield FLC's with a higher second-order nonlinear susceptibility. DTIC

Microstructural origins for reduced weak-link behavior in high-J(sup c) melt-processed YBCO, spray pyrolyzed thick films of Tl-1223, metallic precursor Y-124 polycrystalline powder-in-tube (PIT) wires and PIT Bi-2212/2223 are discussed. Since the materials studied are the highest J(sub c), polycrystalline, high-T(sub c) superconductors fabricated worldwide, the results provide important guidelines for further improvements in superconducting properties, thereby enabling practical applications of these materials. It is found that strongly linked current flow within domains of melt-processed 123 occurs effectively through a single crystal path. In c-axis oriented, polycrystalline Tl-1223 thick films, local in-plane texture has been found to play a crucial role in the reduced weak-link behavior. Formation of 'colonies' of grains with a common c-axis and modest in-plane misorientation was observed. Furthermore, a colony boundary in general has a varying misorientation along the boundary. Large regions comprised primarily of low angle boundaries were observed. Percolative transport through a network of such small angle boundaries appears to provide the non-weak-linked current path. Although powder-in-tube BSCCO 2212 and 2223 also appear to have a 'colony' microstructure, there are some important differences. Colonies in BSCCO consist of stacks of grains with similar c-axis orientation in contrast to colonies in Tl-1223 films where few grains are stacked on top of one another. In the case of Y-124 wires, weak macroscopic in-plane texture is found. Additional measurements are underway to determine if a sharper, local in-plane texture also exists. It is found that in three of the four types of superconductors studied, reduced weak-link behavior can be ascribed to some degree of biaxial alignment between grains, either on a 'local' or a 'global' scale. INTERLAYER MAGNETIC COUPLING IN EPITAXIAL Fe/Cr(211) AND (100) SUPERLATTICES
Eric E. Fullerton, J. E. Mattson, C. H. Sowers, and S. D. Bader Aug. 1994 12 p Presented at the Novel Magnetic Structures and Properties Conference, Santa Fe, NM, 24-25 Jun. 1994; sponsored by Acta Metallurgica, JEOL USA, Inc., Quantum Design, Inc., and Delaware Univ.
(Contract W-31-109-eng-38)
(DE95-002906; ANL/MSD/CP-83081; CONF-9406204-2) Avail: CASI HC A03/MF A01

The authors present magnetic characterization of epitaxial Fe/Cr(211) and Fe/Cr(100) superlattices grown simultaneously on MgO(110) and (100) substrates, respectively. At room temperature, the coupling for these two orientations oscillates in sign with the same period (18(angstrom)), phase and strength. These results indicate that the long-period oscillation is independent of the nested feature of the Cr Fermi-surface. They examine the temperature dependence of interlayer coupling and find a uniform AF bias develops in the (211) samples upon cooling and observe strongly temperature-dependent biquadratic coupling in the (100) samples. DOE

EXCITONS IN SEMICONDUCTING SUPERLATTICES, QUANTUM WELLS, AND TERNARY ALLOYS Technical Report, 15 Sep. 1987 - 31 Jan. 1994
M. D. Sturge, R. E. Nahory (Bell Communications Research, Inc., Red Bank, NJ.), and M. C. Tamargo (Bell Communications Research, Inc., Red Bank, NJ.) Feb. 1994 13 p
(Contract DE-FG02-87ER-45330)
(DE95-001867; DOE/ER-45330/T1) Avail: CASI HC A03/MF A01

Semiconducting layered structures can be fabricated with precisely defined layer thicknesses down to one monolayer; an example is superlattices (SL's), in which two semiconductors with different band gaps are interleaved. Research aims to understand optically excited states in SL's, particularly Type 2 indirect SL's (in which the excited electron and hole are separated both in real and in momentum space); time resolved tunable laser spectroscopy is used. Optical experiments were made in SL's with only a few atomic layers per period, to probe the interface quality. From the study of the exciton spectra of the mixed Type 1-Type 2 CdTe/CdZnTe SL's, the band offset at the CdTe/CdZnTe interface was obtained to high accuracy. Analysis of exciton-phonon coupling at isoelectronic traps, which provide a 3-D analog of the exciton traps formed by well width fluctuations in SL's, has corrected errors and given a self-consistent model of phonon-assisted transitions at these centers. NEUTRON DIFFRACTION STUDY OF THE MAGNETIC ORDERING OF BaCuO(2+x)
X. L. Wang, J. A. Fernandez-Baca, Z. R. Wang (Iowa State Univ. of Science and Technology, Ames, IA.), D. Vaknin (Iowa State Univ. of Science and Technology, Ames, IA.), and D. C. Johnston (Iowa State Univ. of Science and Technology, Ames, IA.) Aug. 1994 11 p Presented at the Neutron Scattering, Sendai, Japan, 11-14 Oct. 1994
(Contracts DE-AC05-84OR-21400; W-7405-eng-82)
(DE95-001357; CONF-9410165-8) Avail: CASI HC A03/MF A01

Neutron diffraction measurements have revealed that BaCuO(2+x) orders antiferromagnetically below T(sub N) = (15.0 +/- 0.5) with a magnetic propagating vector (kappa) = (1 1 1). The Cu atoms in the Cu6 ring clusters, located at the (1/4, 1/4, 1/4) positions, order ferromagnetically within these clusters while the clusters themselves order antiferromagnetically. The ordered magnetic moment of each of these Cu atoms is (0.69 +/- 0.05)mu(sub B) at T=4.2K. No evidence of long-range magnetic ordering of the Cu atoms in the Cu18 clusters, located at the (O, O, O) and (1/2, 1/2, 1/2) positions, was found down to a temperature T=2.5K. DOE

DEFECT PRODUCTION AND RECOMBINATION DURING LOW-ENERGY ION PROCESSING
B. K. Kellerman, J. A. Floro, E. Chason, D. K. Brice, S. T. Picraux, and J. M. White (Texas Univ., Austin, TX.) 1994 20 p Presented at the 41st Annual American Vacuum Society Symposium, Denver, CO, 24-28 Oct. 1994
(Contract DE-AC04-94AL-85000)
(DE95-001827; SAND-94-1280C; CONF-941001-3) Avail: CASI HC A03/MF A01

Low-energy ion processing produces damaged, microroughened semiconductor surfaces due to the production of point defects. The authors present a study of point defect production and annealing on the Ge(001)-2x1 surface during low-energy inert ion bombardment as a function of ion energy, ion mass and substrate temperature. Ion-induced surface point defect production was quantified experimentally in real time using in situ Reflection High Energy Electron Diffraction. The observed surface defect yield decreased abruptly around room temperature as the substrate temperature was increased from 175 K to 475 K. The authors have developed Monte Carlo simulations of defect diffusion to model defect recombination both in the bulk and on the surface. Bulk defect production statistics generated by a binary collision simulator, TRIMRC, were coupled with our bulk diffusion simulator to predict the number of ion-induced surface defects. A comparison between the experimental results and the simulation predictions indicated that defects produced in the bulk may represent a significant contribution to the observed surface defect yield and suggested that TRIMRC may overestimate the depth distribution of the defects. The simulations further indicated that the abrupt drop in the experimental yield with increasing substrate temperature does not arise from bulk defect recombination. The Monte Carlo simulations of surface diffusion (applicable to any crystalline surface) support a defect annealing mechanism (at low ion fluxes) that involves surface recombination of defects generated within a single cascade. DIFFRACTION APPLICATIONS USING THE ENERGY DISPERSIVE BEAMLINE, X6A, AT NSLS
P. L. Lee, M. A. Beno, G. S. Knapp, G. Jennings, and C. M. Ogata (Brookhaven National Lab., Upton, NY.) Aug. 1994 15 p Presented at the International Meeting on Synchrotron Radiation Instrumentation, Stony Brook, NY, 18-22 Jul. 1994
(Contract W-31-109-eng-38)
(DE94-019287; ANL/MSD/CP-82827; CONF-940714-30) Avail: CASI HC A03/MF A01

The energy dispersive beamline X6A, at the National Synchrotron Light Source (NSLS) employs a curved crystal monochromator (polychromator) which focuses a range (approximately 1 keV) of x-ray energies into a narrow (100-120 micron) line image. Although this beamline was constructed primarily for time dependent EXAFS experiments, the authors have begun to explore the use of this instrument for energy dispersive diffraction experiments with different types of sample including macromolecular crystals. The tunability (E = 6.5 keV to 21 keV) and flexibility ((Delta)E = 100-1,000 eV) of the instrument makes the beamline ideal as a test bed for the application of polychromatic single crystal diffraction techniques to different chemical or biological materials. A VERSATILE MASKING PROCESS FOR PLASMA ETCHED BACKSIDE VIA HOLES IN GaAs
A. J. Howard, R. J. Shul, M. L. Lovejoy, and J. C. Word 1994 6 p Presented at the Topical Conference on the Synthesis and Processing of Electronic Materials, San Francisco, CA, 13-18 Nov. 1994
(Contract DE-AC04-94AL-85000)
(DE94-019176; SAND-94-2200C; CONF-9411132-2) Avail: CASI HC A02/MF A01

We have developed a versatile backside via patterning process for a visible transmission modulator application. The vias are processed on mechanically thinned (approximately)100 micrometers thick GaAs using a (approximately)45 micrometers thick, negative tone, photo definable Polyimide mask and Reaction Ion Etch (RIE) plasma etching. The Polyimide masking process was found to be superior in both etch resistance and ease of use (more robust process, thicker, straighter sidewall Profile films, were more easily attained) to masking with standard optical photoresist. With the improved etch resistance (GaAs-to-polyimide etch selectivities of 10:1) we were able to Optimize Cl2-based plasma chemistries and etching conditions to achieve high GaAs etch rates in the RIE exceeding 5.0 micrometers/min. These etch optimization results along with our novel via patterning process are reported in this paper. DOE

TRANSLATIONAL-ENERGY-RESOLVED STUDIES OF PHOTOGRAPHED CARRIER-INDUCED REACTIONS ON SEMICONDUCTOR SURFACES
Richard M. Osgood, Jr. and Quingyun Yang Aug. 1994 10 p
(Contract DE-FG02-90ER-14104)
(DE95-002944; DOE/ER-14104/5) Avail: CASI HC A02/MF A01

Enhancement in carrier lifetime has made semiconductors of interest for applications in photocatalysis ranging from solar energy conversion to environmental remediation. The authors have focused recent experimental work on adsorbed methyl halide molecules (CH3X, X = Br,Cl , I) on GaAs(110). They have identified and observed for the first time several chemical processes which control photochemistry on semiconductor surfaces. During this last year, the authors have focused on relating the observed electron transfer processes to the structure of the adsorbate molecular layer. To accomplish this, they have had to expand the experimental work with new measurement techniques. The primary focus of the work has been in determining the orientation of the adsorbates with regard to the underlying surface correlation. An important result of this work has been that the authors have provided for the first time an unequivocal determination of the orientation of physisorbed molecules on semiconductor surfaces. In addition, the work has suggested that photostimulated desorption of energetic neutrals can provide a useful technique for determining adsorbate molecular orientation. The primary experimental technique has involved dynamic studies employing angle-resolved time-of-flight (TOF) mass spectrometry in concert with tunable laser excitation sources, to obtain information regarding the kinetic energy and angular distribution of reaction products. ANALYSIS OF EXPERIMENTALLY SHOCKED MINERALS BY NMR SPECTROSCOPY
Randall T. Cygan and Mark B. Boslough 1 Oct. 1994 110 p
(Contract DE-AC04-94AL-85000)
(DE95-002955; SAND-94-0294) Avail: CASI HC A06/MF A02

The shock-loading of natural materials by an impact or explosion can result in the formation of modified and altered phases. In order to characterize the resulting material and to evaluate the extent of shock modification, the authors have used nuclear magnetic resonance (NMR) spectroscopy to examine several experimentally shocked minerals. In three related NMR studies, they have (1) examined shocked clinoptilolite, (2) performed a preliminary analysis of shocked quartz, and (3) reproduced shocked quartz results with detailed spectral deconvolutions, and extended it with NMR analysis of shocked feldspar powders. STRUCTURE OF IONIC INTERFACES FROM AN ABSOLUTELY CONVERGENT SOLUTION OF THE MADELUNG PROBLEM
D. Wolf Sep. 1994 23 p Presented at the International Symposium on Interfaces in Ionic Materials, Schloss Ringberg, Germany, 6-11 Mar. 1994
(Contract W-31-109-eng-38)
(DE94-019268; ANL/MSD/CP-84189; CONF-9403159-1) Avail: CASI HC A03/MF A01

The classic Madelung problem, i.e., the divergence associated with the r(exp -1) term in the Coulomb potential of condensed ionic systems, was cast into an absolutely convergent form that is readily evaluated by direct lattice summation, revealing a net r(exp -5) range of this potential. The realization that Coulomb interactions in condensed systems can actually be rather short ranged (if the system is overall neutral) permits novel physical insights into their structure and energetics to be gained. As an example, it was demonstrated that an understanding of the range and the nature of the convergence of the Coulomb potential leads naturally to the prediction, verified by computer simulations for rocksalt-structured surfaces, that all surfaces in predominantly ionic materials should be fundamentally reconstructed. The work also provides a conceptual framework for the theoretical treatment of polar surfaces and interfaces, as demonstrated for the case of the (111) stacking fault and of the (111) twin boundary in the rocksalt structure. EFFECTS OF NEUTRON IRRADIATION ON THE LONDON PENETRATION DEPTH FOR POLYCRYSTALLINE Bi(1.8)Pb(0.3)Sr2Ca2Cu3O10 SUPERCONDUCTOR
J. G. Ossandon (Talca Univ., Chile), J. R. Thompson (Tennessee Univ., Knoxville, TN.), and Y. R. Sun (Tennessee Univ., Knoxville, TN.) Jul. 1994 7 p Presented at the 4th International Conference and Exhibition of the World Congress on Superconductivity, Orlando, FL, 27 Jun. - 1 Jul. 1994
(Contract DE-AC05-84OR-21400)
(DE94-019335; CONF-940627-5) Avail: CASI HC A02/MF A01

Magnetization studies of polycrystalline Bi(1.8)Pb(0.3)Sr2Ca2Cu3O10 superconductor, prior to and after neutron irradiation, showed an increase in J(sub c) due to irradiation damage. Analysis of the equilibrium magnetization revealed significant increases in other more fundamental properties. In particular, the London penetration depth increased by approximately 15% following irradiation with 8 x 10(exp 16) neutrons/sq cm. Corresponding changes were observed in the upper critical magnetic field H(sub c2). However, the most fundamental thermodynamic property, the superconductive condensation energy F(sub c), was unaffected by the moderate level of neutron-induced damage. DOE

STRUCTURE FUNCTIONS AND STRUCTURE FUNCTION RATIO F2(n)/F2(p) AT LOW X(Bj) AND Q2 IN INELASTIC MUON SCATTERING
A. V. Kotwal (Harvard Univ., Cambridge, MA.) Aug. 1994 5 p Presented at the Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM, 2-6 Aug. 1994
(Contract DE-AC02-76CH-03000)
(DE94-018979; FNAL/C-94/251-E; CONF-940816-14) Avail: CASI HC A01/MF A01

Preliminary measurements of the structure functions F(sub 2)(sup p) and F(sub 2)(sup d),and the structure function ratio F(sub 2)(sup n)/F(sub 2)(sup p), in inelastic mu N scattering are presented. The data were obtained by the Fermilab E665 experiment using a 465 GeV muon beam and liquid hydrogen and deuterium targets. The structure functions are presented in the range (chi)(sub Bj) greater than 8 x 10(exp -4) and Q(sup 2) greater than 0.2 GeV(sup 2)/sq c. This structure function ratio is presented as a function of (chi)(sub Bj) for (chi)(sub Bj) greater than 10(exp -6). DOE

Konczykowski (Ecole Polytechnique, Palaiseau, France.), and A. I. Larkin (Landau Inst. for Theoretical Physics, Moscow, USSR.) 1994 3 p Presented at the Meeting on Materials and Mechanisms of Superconductivity: High Temperature Superconductors, Grenoble, France, 4-9 Jul. 1994
(Contract W-7405-eng-82)
(DE95-001682; IS-M-797; CONF-940701-21) Avail: CASI HC A01/MF A01

A Bi2Sr2CaCu2O8 crystal selectively irradiated near the edges is studied using a Hall-sensor array. Vortices penetrating into the central J(sub c) = 0 region are 'focused' in the center of the sample on increasing the applied field. In decreasing field, vortices leave the center and a large vortex accumulation is observed on the inner rim of the irradiated region. Spatially resolved magnetization measurements confirm the developed theoretical model. DOE

NMR RELAXATION BEHAVIOR OF THE HEAD GROUP OF SHBS IN LAMELLAR LIQUID CRYSTALS Technical Report, 1 Jan. 1993 - 23 Apr. 1994
Joseph R. Duke and Frank D. Blum 23 Apr. 1994 28 p Submitted for publication Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-1274)
(AD-A279124; UMR-FDB-38) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Deuterium NMR relaxation-time constants T1Q and T1Z from spectra of a phenyl-ring-deuterated double-tailed surfactant, sodium 4-(1'-heptylnonyl) benzenesulfonate (SHBS) in liquid crystals formed with water were obtained from 0 to 80 C. The relaxation-time constants were determined for the 15 and 90 degree orientations of the powder sample. This data is compared to predicted relaxation time constants from two different models for molecular reorientation, including: (1) phenyl-rings undergoing uniaxial reorientation about the 1'-4' axis and (2) phenyl-rings rotating rapidly about the 1'-4' axis of a molecule which is reorienting about a space fixed director axis. Both models include an adjustable parameter that describes molecular motion about the 1'-4' axis that results from either strong collisions or small step free rotational diffusion. The results from both models indicate the rate of reorientation about the 1'-4' axis of the phenyl ring is approximately three times the nuclear Larmor frequency of the deuterium nucleus, 30 MHz, at room temperature. This rate increases with increasing temperature. The best fits of the data were determined using model (2). The predicted rate constants for motion about this axis differ slightly for each model, whereas, the type of motion predicted by the two models is very different. Model (1) indicates reorientation about the 1'-4' axis is more like strong collisions. Model (2) indicates that the motion is more like small step rotational diffusion. DTIC

STRAIN FIELDS IN CRYSTALLINE MATERIALS: METHODS OF ANALYSIS BASED ON X-RAY DIFFRACTION-LINE BROADENING Ph.D. Thesis [REKVELDEN IN KRISTALLIJNE MATERIALEN: ANALYSEMETHODEN GEBASEERD OP ROENTGENIFFRACTIE-LIJNVERBREDING]
J. G. M. vanBerkum 13 Jun. 1994 199 p
(PB95-108064; ISBN-90-9007196-2) Avail: CASI HC A09/MF A03

The mechanical properties of crystalline materials are often largely determined by the presence of crystal imperfections. All crystal imperfections, including the finite sizes of the grains or crystallites of the material, give rise to broadening of (X-ray) diffraction lines. In this thesis, the attention is concentrated on imperfections that are accompanied by microstrains, i.e. local distortions of the crystalline lattice. Examples of such crystal imperfections are dislocations, precipitates and inclusions. It is easily understood quantitatively that microstrains induce diffraction-line broadening. The aim of this thesis is to develop methods for the analysis of microstrains from (X-ray) diffraction-line broadening. Contents include: Determination of Instrumental Line Broadening; Separation of Size and Strain Broadening; Specific Models for Strain Broadening; and General Model for Strain Broadening. NTIS

ANGLE RESOLVED PHOTOEMISSION ON K(0.3)Mo3, TiTe2 AND Ti(1+x)S2
G. H. Gweon (Michigan Univ., Ann Arbor, MI.), J. W. Allen (Michigan Univ., Ann Arbor, MI.), Y. Zhang (Michigan Univ., Ann Arbor, MI.), R. Claessen (Saarland Univ., Saarbruecken, Germany.), W. P. Ellis, Z. X. Shen (Stanford Univ., CA.), and A. Matsurra (Stanford Univ., CA.) 1994 5 p
(Contracts W-7405-eng-36; DE-FG02-90ER-45416; NSF DMR-91-08015)
(DE94-018300; LA-UR-94-2864) Avail: CASI HC A01/MF A01

The authors have performed high resolution angle resolved photoemission spectroscopy (HRARPES) on samples of K(0.3)MoO3, TiTe2 and Ti(1+x)S2, materials which are a quasi-one dimensional metal, a quasi-two dimensional metal, and a quasi two-dimensional metal (x approaches 0) or semi-conductor (x = 0), respectively. They are interested in looking at these samples using HRARPES as part of the general program to assess the use of photoemission to determine whether a particular system behaves like a Fermi liquid or not. For one dimensional metallic systems, angle integrated photoemission studies to date, e.g., reveal that, contrary to higher dimensional cases where a sharp Fermi cutoff is seen at the Fermi level, there is very little weight at the Fermi level. It seems that there is yet no agreement why this is so. They think that detailed information they get from HRARPES will help them answer this question. The system Ti(1+x)S2 gives the possibility to control the filling of the Ti 3d conduction band by adjusting x. Interest in this system lies in measuring the spectra and the line shape of samples with different stoichiometry and correlating the spectroscopic data with the corresponding transport data. DOE

ULTRAFAST OPTICAL STUDIES OF SURFACE REACTION PROCESSES AT SEMICONDUCTOR INTERFACES
R. J. D. Miller 1994 21 p
(Contract DE-FG02-91ER-14185)
(DE95-001548; DOE/ER-14185/T1) Avail: CASI HC A03/MF A01

The DOE funded research has focused on the development of novel non-linear optical methods for the in situ study of surface reaction dynamics. In particular, the work has concentrated on interfacial charge transfer processes as this is the simplest of all surface reactions, i.e., no bonds are broken and the reaction is derived from nuclear repolarization. Interfacial charge transfer forms the basis for a number of important solar energy conversion strategies. In these studies, semiconductor liquid junctions provide a convenient system in which the interfacial charge transfer can be optically initiated. The all-optical approach necessitates that the dynamics of the charge transfer event itself be put in the proper context of the operating photophysical processes at the surface. There are at least four dynamical processes that are coupled in determining the overall rate of electron flux across the interface. In the limit that interfacial charge transfer approaches strong coupling, the time scale for transport of even field accelerated carriers within the space charge region becomes comparable to the charge transfer dynamics. The transport component needs to be convolved to probes of the carrier population at the surface. The other two dynamical processes, carrier thermalization and surface state trapping, determine the states which ultimately serve as the donor levels to the solution acceptor distribution. In terms of the hot carrier model, these latter two processes compete with direct unthermalized charge transfer. There is a fifth dynamical process which also needs consideration: the solvent modes that are coupled to the reaction coordinate. Ultimately, the dynamics of solvent relaxation determine the upper limit to the charge transfer process. Different optical techniques have been developed to follow all the above dynamical processes in which a real time view of charge transfer dynamics at semiconductor surfaces is emerging. These results are discussed here. DOE

ELECTRONIC STRUCTURE AND ENERGIES OF ALKALINE EARTH OXIDES: MgO, CaO AND SrO
M. Ahmed and A. Mookerjee Jul. 1993 12 p
(DE94-628990; IC-93/214) Avail: CASI HC A03/MF A01 (US Sales Only)

We have used the TB-LMTO scheme to study the electronic structure and the total energies of ceramic oxides MgO, CaO and SrO. All three of them have stable rocksalt structures. We find that although the local density approximation seems to work well for the first two, as the atomic number increases, the approximation begins to fail for SrO. Our calculations tend to show that the last is a metal, whereas experimentally it is as good an insulator as the other two. We suggest that for the larger Z oxides one has to bring in more accurate many-body techniques like the self-interaction correction to get the band gap correctly. DOE

ACOUSTOELECTRIC EFFECT IN SEMICONDUCTOR SUPERLATTICE
S. Y. Mensah, F. K. A. Allotey, and S. K. Adjepong Oct. 1993 5 p
(DE94-628994; IC-93/341) Avail: CASI HC A01/MF A01 (US Sales Only)

Acoustoelectric effect in semiconductor superlattice has been studied for acoustic wave whose wavelength lambda = 2pi/q is smaller than the mean free path of the electrons l (where ql approaches 1). Unlike the homogeneous bulk material where Weinreich relation is independent of the wave number q in the superlattice we observe a dependence on q i.e. spatial dispersion. In the presence of applied constant field E a threshold value was obtained where the acoustoelectric current changes direction. DOE

ANISOTROPIC TRANSPORT PROPERTIES OF BSCCO SINGLE CRYSTALS AND Ag-CLAD TAPES IN HIGH MAGNETIC FIELDS
M. P. Maley, J. H. Cho, S. Fleshler, and L. N. Bulaevskii 1994 25 p Presented at the 7th Conference on Superconductivity and Applications, Buffalo, NY, 7-9 Sep. 1994
(Contract W-7405-eng-36)
(DE95-000938; LA-UR-94-3235; CONF-940926-2) Avail: CASI HC A03/MF A01

We report measurements of resistivity and critical current density on single crystals of Bi-2212 with current flow both parallel and perpendicular to the CuO2 planes and in magnetic fields to 18T. For comparison, similar measurements were performed on samples of Bi-2223 tape conductors with the Ag cladding removed. For current flow along the c-axis of the crystals the semiconducting behavior (resistivity increasing with decreasing temperature) is extended to below 50K in a field of 18T, followed by a sharp transition to the superconducting state. From I-V curves of c-axis transport we extract the magnetic field and temperature dependencies of the interlayer critical current density J(sub c,c) and define a decoupling line H(sub D)(T) above which J(sub c,c) vanishes. H(sub D)(T) lies close to but above the irreversibility H(sub irr)(T) obtained from magnetic measurements. We also observe a decoupling induced below H(sub D)(T) by the application of a magnetic field starting from the zero field cooled state, ZFC. The resulting 'pancake vortex' density gradient causes a loss of c-axis phase coherence and produces a c-axis resistance that relaxes logarithmically with time as the magnetization decays. These results are contrasted with similar measurements performed on highly textured Bi-2223 tapes. For current flow along the tape normal (nominal c-axis) the resistivity is metallic and its temperature and field dependence scales with those for in-plane current flow. Similarly critical currents for the two directions show similar field and orientation dependence. These results are consistent with predominant percolative current paths along crystallographic ab planes even for transport normal to the tape plane. DOE

HOW TO IMPROVE J(c(T)) IN Ag/(BiPb)2Sr2Ca2Cu3O10 TAPES
M. Karkut and K. Fossheim 16 Jun. 1994 16 p
(PB95-110326; STF19-A94010) Avail: Issuing Activity (National Technical Information Service (NTIS))

We consider how to improve the magnetic field dependence of the critical current density J(c) in Ag/BSCCO superconducting tapes. First we look at mechanisms that provide pinning in the oxide superconductors and then consider the special problems that one encounters with Ag/BSCCO tapes. We propose several testable propositions to be performed in collaboration with NKT, Denmark and Tampere University, Finland. NTIS

RECIPROCAL SPACE MAPPING OF EPITAXIAL MATERIALS USING POSITION-SENSITIVE X-RAY DETECTION
S. R. Lee, B. L. Doyle, T. J. Drummond, J. W. Medernach, and R. P. Schneider, Jr. 1994 14 p Presented at the 43rd Annual Denver X-ray Conference, Steamboat Spring, CO, 1-5 Aug. 1994
(Contract DE-AC04-94AL-85000)
(DE95-001620; SAND-94-1071C; CONF-9408178-1) Avail: CASI HC A03/MF A01

Reciprocal space mapping can be efficiently carried out using a position-sensitive x-ray detector (PSD) coupled to a traditional double-axis diffractometer. The PSD offers parallel measurement of the total scattering angle of all diffracted x-rays during a single rocking-curve scan. As a result, a two-dimensional reciprocal space map can be made in a very short time similar to that of a one-dimensional rocking-curve scan. Fast, efficient reciprocal space mapping offers numerous routine advantages to the x-ray diffraction analyst. Some of these advantages are the explicit differentiation of lattice strain from crystal orientation effects in strain-relaxed heteroepitaxial layers; the nondestructive characterization of the size, shape and orientation of nanocrystalline domains in ordered-alloy epilayers; and the ability to measure the average size and shape of voids in porous epilayers. Here, the PSD-based diffractometer is described, and specific examples clearly illustrating the advantages of complete reciprocal space analysis are presented. DOE

CRITICAL DYNAMICS AND PLASTIC FLOW IN DISORDERED JOSEPHSON JUNCTION ARRAYS
D. Dominguez Jan. 1994 13 p
(DE94-629074; IC-94/12) Avail: CASI HC A03/MF A01 (US Sales Only)

We present numerical simulations of Josephson junction arrays with positional disorder. We study their IV characteristics and vortex dynamics as a function of disorder. We find that above the critical current i(sub c) there is a plastic flow of vortices and antivortices through channels, characterized by strong fluctuations of the total vorticity. For large currents there is a crossover to homogeneous flow without vortex fluctuations. We also study the dynamical critical behaviour close to i(sub c) in the gauge glass mode, calculating critical exponents for the voltage onset and voltage fluctuations. DOE

BREAKDOWN OF THE LAW OF LARGE NUMBERS IN JOSEPHSON JUNCTION SERIES ARRAYS
D. Dominguez and H. A. Cerdeira Jan. 1994 12 p
(DE94-629075; IC-94/13) Avail: CASI HC A03/MF A01 (US Sales Only)

We study underdamped Josephson junction series arrays that are globally coupled through a resistive shunting load and driven by an RF bias current. We find that they can be an experimental realization of many phenomena currently studied in globally coupled logistic maps. We find coherent, ordered, partially ordered and turbulent phases in the IV characteristics of the array. The ordered phase corresponds to giant Shapiro steps. In the turbulent phase there is a saturation of the broad band noise for a large number of junctions. This corresponds to a break down of the law of large numbers as seen in the globally coupled maps. Coexisting with this, we find an emergence of novel pseudo-steps in the IV characteristics. This effect can be experimentally distinguished from the Shapiro steps, which do not have broad band noise emission. DOE

EQUILIBRIUM AND SHOT NOISE IN MESOSCOPIC SYSTEMS
T. Martin 1994 17 p Presented at the Rencontred de Moriond Meeting on Gravitation and Astrophysics, Villars-Sur-Ollon, France, 22-29 Jan. 1994
(Contract W-7405-eng-36)
(DE95-000855; LA-UR-94-3149; CONF-940187-2) Avail: CASI HC A03/MF A01

Within the last decade, there has been a resurgence of interest in the study of noise in Mesoscopic devices, both experimentally and theoretically. Noise in solid state devices can have different origins: there is 1/f noise, which is believed to arise from fluctuations in the resistance of the sample due to the motion of impurities. On top of this contribution is a frequency independent component associated with the stochastic nature of electron transport, which will be the focus of this paper. If the sample considered is small enough that dephasing and inelastic effects can be neglected, equilibrium (thermal) and excess noise can be completely described in terms of the elastic scattering properties of the sample. As mentioned above, noise arises as a consequence of random processes governing the transport of electrons. Here, there are two sources of randomness: first, electrons incident on the sample occupy a given energy state with a probability given by the Fermi-Dirac distribution function. Secondly, electrons can be transmitted across the sample or reflected in the same reservoir where they came from with a probability given by the quantum mechanical transmission/reflection coefficients. Equilibrium noise refers to the case where no bias voltage is applied between the leads connected to the sample, where thermal agitation alone allows the electrons close to the Fermi level to tunnel through the sample. In general, equilibrium noise is related to the conductance of the sample via the Johnson-Nyquist formula. In the presence of a bias, in the classical regime, one expects to recover the full shot noise ((Delta)(sup 2)I) = 2I(Delta)(mu) as was observed a long time ago in vacuum diodes. In the Mesoscopic regime, however, excess noise is reduced below the shot noise level. The author introduces a more intuitive picture, where the current passing through the device is a superposition of pulses, or electron wave packets, which can be transmitted or reflected. DOE

FULL POTENTIAL MULTIPLE SCATTERING THEORY
J. M. MacLaren (Tulane Univ., New Orleans, LA.) 20 Oct. 1994 6 p
(Contract W-7405-eng-48)
(DE95-003197; UCRL-CR-116369) Avail: CASI HC A02/MF A01

A practical method for performing self-consistent electronic structure calculations based upon full-potential multiple-scattering theory is presented. Solutions to the single site Schroedinger equation are obtained by solving coupled channel integral equations for a potential which is analytically continued out to the circumscribing sphere. This potential coincides with the full cell potential inside each atomic cell. Scattering matrices and wavefunctions for the full cell potential are obtained from surface Wronskian relations. The charge density is obtained from the single particle Green's function. This Green's function is computed using the cell scattering matrices and wavefunctions using the layer multiple scattering theory. Self consistent solutions require a solution at each iteration to the Poisson equation. The Poisson equation is solved using a variational cellular method. In the approach a local solution to each cell is augmented by adding a series of regular harmonics (solutions to Laplace's equation). Minimizing the coulomb energy, subject to continuity of the potential across all cell boundary provides an expression for the coefficients of the regular harmonics. This method is applied to BCC Nb. Calculated properties converge well in angular momentum and show comparable accuracy to full potential linearized muffin-tin orbital calculations. DOE

GROWING AND RELEASING DIAMONDS Patent Application
Pehr E. Pehrsson, inventor (to Navy) and Michael J. Marchywka, inventor (to Navy) 23 Apr. 1994 17 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-D016489; US-Patent-Appl-SN-266758) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

A process for making diamond and diamond products includes the steps of implanting ions in a diamond substrate to form a damaged layer of non-diamond carbon below the top surface of the substrate, heating the substrate to about 600-1200 C, growing diamond on the top surface of the heated substrate by chemical vapor deposition, and electrochemically etching the damaged layer to separate the grown diamond from the substrate along the damage layer. The diamond product consists of a first diamond layer and a second diamond layer attached to the first layer. The second layer contains damage caused by ions traversing the second layer. DTIC

AC MAGNETIC RESPONSE OF YBa2CuO7 WITH Y2BaCuO5 INCLUSIONS AND OF SINGLE-CRYSTAL YBa2Cu3O7: A COMPARATIVE STUDY
M. G. Karkut, M. Slaski, L. K. Heill, L. T. Sagdahl, and K. Fossheim 20 Jan. 1994 18 p Prepared in cooperation with Birmingham Univ., England; Royal Norwegian Council for Scientific and Industrial Research, Oslo, Norway; and Norges Almenvitenskapelige Forskningsraad, Oslo, Norway
(PB94-207917; STF19-A93014) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

We have measured the AC magnetic permeability response function mu=mu(prime) + i(mu)(double prime) in melt-process-melt-growth YBa2Cu3O7 (Y123) with Y2BaCuO5 (Y211) inclusions (MPMG) and in single-crystal YBa2Cu3O7 (SC) in applied magnetic fields up to 8T, oriented either parallel or perpendicular to the crystalline c-axis. The AC response of the two samples has been mapped out as a function of temperature, AC field amplitude and frequency, DC applied field, and field orientation. The peak in the lossy part of the susceptibility mu(double prime) (H,T) is used to probe the flux dynamics in the vicinity of the 'irreversibility' line (IL), defined here as the locus of mu(double prime) maxima in the H-T plane. Results are discussed. NTIS

ELECTRIC-FIELD EFFECTS ON SHALLOW DONOR IMPURITY IN A HARMONIC QUANTUM DOT
Kadi Zhu and Shiwei Gu (Jiaotong Univ., Shanghai, China.) Oct. 1993 17 p
(DE94-629034; IC-93/346) Avail: CASI HC A03/MF A01 (US Sales Only)

Electric-field effects on shallow donor impurity states in a harmonic quantum dot are investigated theoretically using the effective-mass approximation within the strong confinement regime. It is shown that the transition energies between the ground state and the low-lying excited states shrink with enhancement of electric field strength. The results also indicate that the transition energy allowed for left circular light polarization increases with enhancement of magnetic field strength, while the transition energy allowed for right circular light polarization decreases with increasing magnetic field strength. DOE

THE DOPING EFFECT ON SPIN-PEIERLS INSTABILITY
Zhong-Yi Lu (Academia Sinica, Beijing, China.), Zhao-Bin Su (Academia Sinica, Beijing, China.), and Lu Yu Jan. 1994 11 p
(DE94-629046; IC-94/34) Avail: CASI HC A03/MF A01 (US Sales Only)

We study the effects of doping on spin-Peierls (SP) systems using the unimodular mean-field theory. The impurity spins affect the singlet valence bond field and renormalize the magnetic excitations. The SP transition temperature and the energy gap of magnetic excitations are reduced by factors approximately n(sub i) and approximately n(sub i)(sup 2/3), respectively, with n(sub i) as the impurity density. At certain value of n(sub i), a gapless SP phase occurs, and the interaction between impurities becomes RKKY-like. The recently observed reduction of SP transition temperature upon doping and occurrence of a spin glass phase is interpreted using the proposed theory. DOE

FLUX CREEP WITH LOGARITHMIC U(j) DEPENDENCE
Wei Wang and Jinming Dong (Nanjing Univ., China.) Oct. 1993 16 p
(DE94-629058; IC-93/364) Avail: CASI HC A03/MF A01 (US Sales Only)

In this paper we have studied the flux motion in a high-T(sub c) superconductor. For both field-cooled and zero-field-cooled cases, we have numerically solved the flux motion equations, and calculated various magnetizations M(t) changing with the time t. The scaling behaviour of the magnetization has been obtained. There is a kink in the magnetization curve corresponding to the reaching of the flux front to the middle of the slab sample. The self-organized critical state (SOC) relates to the early time of the flux penetration and the effect of temperature on the SOC has been discussed. DOE

MAGNETIC INTERACTIONS IN THE EMERY MODEL
Minhtien Tran Nov. 1993 25 p
(DE94-629059; IC-93/370) Avail: CASI HC A03/MF A01 (US Sales Only)

The Emery model CuO2 planes in high T(sub c) superconductors is considered. Treating this model by the cell-perturbation method, a singlet-triplet model with effective spin interactions is derived. Both superexchange (SE) and Ruderman-Kittle-Kasuya-Yosida (RKKY) interactions are calculated. It is found that with increasing carrier concentration, the SE interaction decreases, while the RKKY interaction increases. With increasing oxygen transfer both SE and RKKY interactions increase. The SE interaction is dominant, except for a small region of large hole doping where the SE interaction changes its sign. The suppression of the exchange interaction with hole doping is found and it may explain the drop of magnetic order with hole doping. The magnetic frustrations are also calculated and they are found even for zero bandwidth and for the half-filling insular case. DOE

TECHNICAL COST MODELING APPLIED TO CVD DIAMOND DEPOSITION Quarterly Report No. 3
1994 60 p
(Contract N00014-93-C-2044)
(AD-A286119) Avail: CASI HC A04/MF A01

IBIS Associates has completed its predictive spreadsheet models of chemical vapor deposition (CVD) diamond film fabrication. This report details the capabilities of the models, and shows cost sensitivities to product and process input parameters. The DC arcjet, microwave, and combustion flame CVD diamond deposition models, in addition to the CVD diamond finishing model, have been developed to maximize cost estimation flexibility. In doing so for deposition, inputs such as thermal conductivity, machine power, gas concentration, gas temperature, and reactor pressure have been provided in the model to predict the deposition growth rate, which is critical to the cost calculation. For the finishing model, inputs such as laser power, laser spot size, and laser frequency have been provided in the model to predict the diamond removal rate, which is also critical to the final cost calculation. LOCAL TEXTURE AND STRONGLY LINKED CONDUCTION IN SPRAY-PYROLYZED TlBa2Ca2Cu3O(8+x) DEPOSITS
D. M. Kroeger, A. Goyal, E. D. Specht, Z. L. Wang (National Inst. of Standards and Technology, Gaithersburg, MD.), J. E. Tkaczyk (General Electric Co., Schenectady, NY.), J. A. Sutliff (General Electric Co., Schenectady, NY.), and J. A. Deluca (General Electric Co., Schenectady, NY.) 1993 6 p Presented at the 6th US-Japan Workshop on Superconductivity, Houston, TX, 6-7 Dec. 1993
(Contract DE-AC05-84OR-21400)
(DE94-017887; CONF-931238-4) Avail: CASI HC A02/MF A01

Local texture in polycrystalline TlBa2Ca2 Cu3O(8+x) deposits has been determined from transmission electron microscopy, electron backscatter diffraction patterns and x-ray diffraction. The small-grained deposits had excellent c-axis alignment and contained colonies of grains with similar but not identical a-axis orientations. Most grain boundaries within a colony have small misorientation angles and should not be weak links. It is proposed that long range conduction utilizes a percolative network of small angle grain boundaries at colony intersections. DOE

AN IMPROVED MONTE CARLO ALGORITHM FOR SIMULATING GRAIN GROWTH
B. Radhakrishnan, T. Zacharia, and A. J. Paul (Concurrent Technologies Corp., Johnstown, PA.) 1994 6 p Presented at The Minerals, Metals and Materials Society Conference, Nemacolin Woods, PA, 20 Jul. 1994
(Contract DE-AC05-84OR-21400)
(DE94-017903; CONF-9407119-1) Avail: CASI HC A02/MF A01

The Monte Carlo algorithm that currently exists in the literature for simulating curvature-driven grain growth has been modified. The grain growth exponent as a function of grain size obtained using the new algorithm approaches the theoretical limit of 0.5 more rapidly than that obtained using the old algorithm. The upper limit of grain size distributions obtained with the new algorithm is significantly lower than that obtained with the old, because the new algorithm eliminates grain coalescence during grain growth. The log-normal function provides an excellent fit to the grain size distribution data obtained with the new algorithm, after taking into account the anisotropy in grain boundary energy. DOE

BIAXIALITY OF CHIRAL LIQUID CRYSTALS
L. Longa, H. R. Trebin (Stuttgart Univ., Germany.), and W. Fink (Stuttgart Univ., Germany.) Oct. 1993 36 p
(DE94-629032; IC-93/338) Avail: CASI HC A03/MF A01 (US Sales Only)

Using extended deGennes-Ginzburg-Landau free energy expansion in terms of the anisotropic part of the dielectric tensor field Q(sub alpha beta)chi a connection between the phase biaxiality and the stability of various chiral liquid crystalline phases is studied. In particular the cholesteric phase, the cubic Blue Phases and the phases characterized by an icosahedral space group symmetry are analysed in detail. Also a general question concerning the applicability of the mean-field approximation in describing the chiral phases is addressed. By an extensive study of the model over a wide range of the parameters a new class of phenomena, not present in the original deGennes-Ginzburg-Landau model, has been found. These include: (1) re-entrant phase transitions between the cholesteric and the cubic blue phases; and (2) the existence of distinct phases of the same symmetry but of different biaxialities. The phase biaxiality serves here as an extra scalar order parameter. Furthermore, it has been shown that due to the presence of the competing bulk terms in the free energy, the stable phases may acquire a large degree of biaxiality, also in liquid crystalline materials composed of effectively uniaxial molecules. A study of icosahedral space group symmetries gives a partial answer to the question as to whether an icosahedral quasicrystalline liquid could be stabilized in liquid crystals. Although, in general, the stability of icosahedral structures could be enhanced by the extra terms in the free energy no absolutely stable icosahedral phase has been found. DOE

(Contract N00014-89-J-1225)
(AD-A286479; TR-77) Avail: CASI HC A03/MF A01

15N CSA spectra were acquired for four isotopically labelled bisphthalimide compounds. The 15N CSA tensor elements (delta 11, delta 22, and delta 33) for the labeled derivatives were determined from CSA line shape analysis. In addition, the CSA spectrum for the 15N-13C labelled N-methylphthalimide was obtained. From CSA lineshape analysis it was determined that delta 33 lies approximately along the N-C bond axis, with delta 22 assumed to be approximately perpendicular to the imide plane. The angles alpha and Beta were found to be 90 deg and 7 deg, respectively. The dipolar coupling constant for 13C-I 5N bond was 883 Hz, corresponding to a bond length of 1.51 A. DTIC

INTRODUCTION TO THE STRUCTURES DETERMINATION METHODS USING X-RAY DIFFRACTION IN MONOCRYSTALS: APPLICATION TO SOME LANTHANIDES AND TRANSITION METALS COMPLEXES WITH ORGANIC LIGANDS M.S. Thesis
G. Oliva 1983 238 p In PORTUGESE
(DE94-629002; INIS-BR-3344) Avail: CASI HC A11/MF A03 (US Sales Only)

The crystal structure of the complexes Ln (Cl O4)3.6(P O N H2 (C6 H5)2) where Ln = Eu, La, Cu(N H2 (C H3)2 C C O2)2 , Ni Br2.4(As O(C6 H5)3) . 8 H2 O (green), Ni Br2.4(As O (C6 H5)3). 1,5 (C H3 C6 H5).H2 O (orange) and of the ligand P O N H2 (C6 H5)2 have been determined by X-ray diffraction. The complexes involving lanthanide ions refined to final R factors of R(Eu) = 0.125 and R(La) = 0.133 and the following main features were found: the crystal system is cubic; the cation is coordinated to six ligand oxygens in octahedral (Eu) and trigonal anti prismatic (La) configurations with the rate earths on positions of high symmetry (23 for Eu and 3-bar for La); the rest of the structures shows different degrees of disorder. In the light of the geometrical configuration, the occurrence of a strong band (sup 5) D(sub O) - (sup 7) F(sub 2) in the fluorescence spectrum of the Eu complex, forbidden on symmetry grounds, is interpreted as a consequence of vibronic coupling. A splitting of the infrared (nu)(sub P=0) band in the La complex is attributed to the presence of P = 0 groups non-equivalently bonded to the rare earth due to the disorder of this atom.

THERMODYNAMIC CHARACTERIZATION OF NEW PALLADIUM ALLOY TRITIDES
J. S. Hoelder and J. R. Wermer Aug. 1994 24 p Presented at the International Symposium on Metal-hydrogen Systems, Fuji-Yoshida, Japan, 6-11 Nov. 1994
(Contract DE-AC09-89SR-18035)
(DE94-018430; WSRC-MS-94-0259; CONF-9411129-1) Avail: CASI HC A03/MF A01

The decay of tritium in a metal tritide generates (3)He in the lattice which tends to degrade the performance of the material over time. It is desired to develop a material which minimizes the tritium aging effects and may be tailored to a particular tritium processing application. Pd alloys with Ni and Co have been investigated, as Pd tritide is known to be resistant to tritium aging effects and alloying provides a means for adjusting the plateau pressure of the metal tritide. Sets of tritium desorption isotherms were acquired at temperatures between 273 and 338 K over the pressure range of 1 to 900 kPa. The thermodynamic parameters of (Delta)H and (Delta)S for the (beta)-(alpha) phase transition of the metal tritides were determined across the plateau regions of the P-C-T curves. The average values of (Delta)H (kJ/mol(center dot)T) and (Delta)S (J/K/mol(center dot)T) were found to be 15.8 and 50.1 for Pd(2.8 wt. %)Ni, 13.7 and 50.3 for Pd(5.2 wt. %)Ni, 15.9 and 51.3 for Pd(2.8 wt. %)Co, and 13.6 and 51.8 for Pd(5.2 wt. %)Co, respectively.

THE PARADIGM OF PSEUDODUAL CHIRAL MODELS
C. K. Zachos and T. L. Curtright (Miami Univ., Coral Gables, FL.) 1994 10 p Presented at the Symposium on Particles, Strings and Cosmology, Syracuse, NY, 19-24 May 1994
(Contract W-31-109-eng-38)
(DE94-016386; ANL-HEP-CP-94-33; CONF-9405162-1) Avail: CASI HC A02/MF A01

This is a synopsis and extension of Phys. Rev. D49 5408 (1994). The Pseudodual Chiral Model illustrates 2-dimensional field theories which possess an infinite number of conservation laws but also allow particle production, at variance with naive expectations -- a folk theorem of integrable models. We monitor the symmetries of the pseudodual model, both local and nonlocal, as transmutations of the symmetries of the (very different) usual Chiral Model. We refine the conventional algorithm to more efficiently produce the nonlocal symmetries of the model. We further find the canonical transformation which connects the usual chiral model to its fully equivalent dual model, thus contra-distinguishing the pseudodual theory. DOE

VON NEUMANN ALGEBRA AUTOMORPHISMS AND TIME-THERMODYNAMICS RELATION IN GENERAL COVARIANT QUANTUM THEORIES

A. Connes and C. Rovelli (Pittsburgh Univ., Pittsburgh, PA.) Jun. 1994 28 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB95-111084; IHES/M/94/36) Avail: CASI HC A03

The authors consider the cluster of problems raised by the relation between the notion of time, gravitational theory, quantum theory and thermodynamics; in particular, the authors address the problem of relating the 'timelessness' of the hypothetical fundamental general covariant quantum field theory with the 'evidence' of the flow of time. By using the algebraic formulation of quantum theory, the authors propose a unifying perspective on these problems, based on the hypothesis that in a generally covariant quantum theory the physical time-flow is not a universal property of the mechanical theory, but rather it is determined by the thermodynamical state of the system ('thermal time hypothesis'). The authors implement this hypothesis by using a key structural property of von Neumann algebras; the Tomita-Takesaki theorem, which allows to derive a time-flow, namely a one-parameter group of automorphisms of the observable algebra, from a generic thermal physical state. The authors study this time-flow, its classical limit, and the authors relate it to various characteristic theoretical facts, as the Unruh temperature and the Hawking radiation. The authors also point out the existence of a state-independent notion of 'time'. NTIS

FACTORIZATION IN CLOSED STRING FIELD THEORY

F. Anton, A. Abdurrahman, and J. Bordes Jun. 1994 17 p Prepared in cooperation with Valencia Univ.
(PB95-133542; RAL-94-064) Avail: Issuing Activity (National Technical Information Service (NTIS))

The so long made assumption, that a general closed-string vertex operator V should be built as a product of left- and right-moving vertex operators, rests on the fact that closed-string Fock space is constructed as a tensor product of left- and right-moving open-string Fock spaces. In this letter we will relax this assumption by proving that factorization of closed-string vertices is a general rule. NTIS

CONSTRAINTS ON SUSy-GUT UNIFICATION FROM b YIELDS s-GAMMA DECAY

V. Barger, M. S. Berger, P. Ohmann, and R. J. N. Phillips Jul. 1994 20 p Prepared in cooperation with Wisconsin Univ., Madison, WI
(Contract DE-AC02-76ER-00881)
(PB95-130373; RAL-94-046) Avail: Issuing Activity (National Technical Information Service (NTIS))

The top-quark Yukawa infrared fixed-point solution of the renormalization group equations, with minimal supersymmetry and GUT unification, defines a low-energy spectrum of supersymmetric particle masses in terms of a few GUT-scale parameters assuming universal boundary conditions. The authors give predictions in this model for the inclusive b approaches s(gamma) branching fraction and investigate the impact of non-universal scalar mass boundary conditions. The authors find their results do not depend significantly on the value of the GUT-scale trilinear coupling A(sub G). The small tan beta region favors predictions for the inclusive b approaches s(gamma) branching fraction close to that of the Standard Model value. Nevertheless forthcoming experimental results can eliminate some regions of the GUT parameter space. NTIS

CALCULATION OF Z PLUS FOUR JET PRODUCTION AT THE TEVATRON

V. Barger, E. Mirkes, R. J. N. Phillips, and T. Stelzer Aug. 1994 11 p Prepared in cooperation with Wisconsin Univ., Madison, WI
(Contract DE-AC02-76ER-00881)
(PB95-130472; RAL-94-070) Avail: Issuing Activity (National Technical Information Service (NTIS))

We present the first calculation of Z + 4 jet production with heavy quark flavor identification at the Tevatron P(bar-p) collider. The Z + 4 jet channel is especially interesting as a normalizer for the W + 4 jet background to top quark signals, as a background to a possible t approaches cZ flavor-changing neutral-current (FCNC) decay signal, and as a background to missing-P(sub T) signals from gluino pairs. We also calculate the contributions to W + 4 jet production from all the different heavy-flavor final states. The MADGRAPH program is used to generate all leading order subprocess helicity amplitudes. We present Monte Carlo results with separation and acceptance criteria suitable for the Tevatron experimental analyses. NTIS

QUANTUM DIFFUSION

S. Habib 1994 6 p Presented at the Drexel Conference on Quantum Non Integrability, Philadelphia, PA, Sep. 1994
(Contract W-7405-eng-36)
(DE95-001015; LA-UR-94-3329; CONF-9409228-1) Avail: CASI HC A02/MF A01

We consider a simple quantum system subjected to a classical random force. Under certain conditions it is shown that the noise-averaged Wigner function of the system follows an integro-differential stochastic Liouville equation. In the simple case of polynomial noise-couplings this equation reduces to a generalized Fokker-Planck form. With nonlinear noise injection new 'quantum diffusion' terms rise that have no counterpart in the classical case. Two special examples that are not of a Fokker-Planck form are discussed: the first with a localized noise source and the other with a spatially modulated noise source. DOE

MOLECULAR-BASED STUDY OF SOLUTIONS IN SUPERCRITICAL SOLVENTS

V. M. Shah (Tennessee Univ., Knoxville, TN.), L. L. Lee (Oklahoma Univ., Norman, OK.), and H. D. Cochran 1994 8 p Presented at the 3rd International Symposium on Supercritical Fluids, Strasbourg, France, 17-19 Oct. 1994
(Contract DE-AC05-84OR-21400)
(DE94-019326; CONF-9410114-1) Avail: CASI HC A02/MF A01

Behavior and properties of solutions in supercritical (SC) solvents are related to microscopic structures, and the structure and properties of typical attractive SC solutions have been well studied both experimentally and theoretically. New and interesting properties, however, have been uncovered in recent studies of dilute repulsive and weakly attractive SC solutions. Such repulsive and weakly attractive solutions are encountered in practice when relatively volatile substances are present in a SC solvent. Specific examples of practical importance include organic molecules in SC water and light gases in SC carbon dioxide. We report a study of the microscopic structure and thermodynamic properties of these less-known repulsive and weakly attractive SC mixtures. Results are based on integral equation calculations for model systems and illustrate the qualitative behaviors that may be expected in practice. The results are based on Ornstein-Zernike integral equation calculations in the Percus-Yevick approximation applied to dilute, binary Lennard-Jones mixtures. The microscopic structures calculated (pair correlation functions) are related to the thermodynamic properties through the fluctuation integrals of Kirkwood-Buff theory. Whether the system behaves as a repulsive mixture or a weakly attractive mixture depends on size of solute molecule and strength of its intermolecular attraction relative to the solvent molecule as well as on the temperature and density of the system relative to the critical temperature and density of the solvent. NEW IMPROVED DERIVATIVE EXPANSION FOR FIELD THEORIES WITH SPONTANEOUS SYMMETRY BREAKING

Lai-Him Chan 1994 3 p Presented at the Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM, 2-6 Aug. 1994

(Contract DE-FG05-91ER-40617)
(DE94-019349; DOE/ER-40617/181; CONF-940816-16) Avail: CASI HC A01/MF A01

Derivative expansion of the effective action for field theories with spontaneous symmetry breaking may be badly divergent. I propose a new expansion series in which the series expansion are simultaneous developed in order of the number of derivatives of the field and in power of the deviation of the field from its ground state value. As examples, I have applied this new method to calculate the quantum correction to the energy of the 1+1 dimension soliton in various models. For the models in which exact solutions have been found, such as the Sine-Gordon soliton, phi(exp 4) soliton, and phi(exp 4) soliton with fermion loop, the improved series can be recognized as well-known analytically summable series. The results of the exact solutions are completely recovered. More importantly, for the cases where exact solutions may not be available, Pade approximant or the Borel summation can be used to give good approximation. DOE

RESONANT GENERATION OF NONEQUILIBRIUM PHONONS IN GaAs/AlAs QUANTUM WELLS VIA INTERSUBBAND SCATTERING

Z. P. Su, T. Ruf, K. R. Wald, P. Y. Yu, and K. T. Chan (Chinese Univ. of Hong Kong, Shatin, Hong Kong.) Jul. 1994 4 p Presented at the 22th International Conference on Physics of Semiconductors, Vancouver, British Columbia, 15-19 Aug. 1994
(Contract DE-AC03-76SF-00098)
(DE95-002338; LBL-35940; CONF-9408155-11) Avail: CASI HC A01/MF A01

The authors have studied the resonant intersubband scattering of optical phonons or RISOP theoretically and by picosecond scattering. Experimentally, the authors have established a way to determine phonon occupancy in quantum wells. The model calculation shows that a significant amount of long wavelength LO phonons are generated by RISOP in GaAs/AlAs quantum wells. However, they measured a much smaller phonon population than predicted. The discrepancy can be explained by a breakdown of in-plane wave vector conservation due to interface roughness. DOE

THE METHOD OF EVALUATING QUANTUM PARTITION FUNCTION FOR THE HUBBARD MODEL

S. Karnaukhov Aug. 1993 9 p
(DE94-628991; IC-93/277) Avail: CASI HC A02/MF A01 (US Sales Only)

The method of evaluation of quantum partition function (QPF) in some four fermion models is proposed. The calculations are carried out by the path integral method. The integral is evaluated by introducing the additional fields (called Hubbard-Stratanovich transformation in some models), integration over fermionic variables, and considering the finite-dimensional approximation of rest integral over bosonic fields in the infinite limit. The result can be represented as a sum of the functional derivatives with respect to the arbitrary bosonic field of the quantum partition of free fermionic theory in the external bosonic field. This expression can be treated in a mean field approximation in closed form (the determinants corresponding to the arbitrary external field are substituted by its mean values corresponding to the mean value of the external fields). The quantum partition function is represented as the integral representation of the function. The approximation for the QPF of the free theory is considered, and the corresponding answer for QPF is studied. A convenient perturbation expansion for ln Z is developed. DOE

PHYSICS OF CORRELATED STUDIES

C. H. Greene 1993 8 p
(Contract DE-FG02-90ER-14145)
(DE95-001204; DOE/ER-14145/T3) Avail: CASI HC A02/MF A01

During the three year period of this grant, a major initiative was started to develop theoretical methods to treat complex open-shell atoms in a manner permitting a simple interpretation of the dynamics. This project has been far more successful than originally hoped, with accurate ground state photoionization cross sections calculated for nine different open-shell atoms in the periodic table. This work culminated in our first application to multichannel autoionizing spectra of a transition metal atom, scandium. These methods were also extended and adapted to permit a description of nonresonant two-photon processes at the perturbative level, and some nonperturbative multiphoton processes. The angular distribution of photoelectrons ejected in resonant multiphoton ionization of magnesium was also successfully calculated. We made headway toward understanding aspects of the diamagnetic quasi-Landau problem, specifically interpreting the observed simplicity of the spectrum when plotted simultaneously versus energy and field. High two-electron excitations of H(-) and Li(-) were treated using R-matrix methods, combined with a time delay analysis to quantitatively test various propensity rules proposed in the literature. These calculations also gave the first accurate description of H(-) experiments at Los Alamos, up to the n = 6 threshold. A new set of computer programs was developed to handle double-Rydberg 'planetary' states of barium and strontium, incorporating long range multipole interactions explicitly. Finally, we studied triply-excited states of H(- -) in an attempt to clarify the question of whether such resonances exist. Each of these projects is described in greater detail below. DOE

N95-21887# International Centre for Theoretical Physics, Trieste (Italy).

EFFECT OF THE ELECTRON-SO-PHONON ON THE IMPURITY STATE ENERGIES IN A SEMICONDUCTOR QUANTUM WELL

Zhongjun Shen Sep. 1993 12 p
(DE94-628993; IC-93/315) Avail: CASI HC A03/MF A01 (US Sales Only)

Using variational technique the change of ground state energy and binding energy of impurity atom with impurity position and well width in GaAs-Ga(0.7)Al(0.3)As quantum well is calculated. In calculation the electron-surface optical (SO) phonon interactions are taken into account. The result is discussed. It is found that the electron-phonon interaction energy not only depends on the width of the well but also depends on the position of the impurity atom in the well. DOE

HETEROSTRUCTURE QUANTUM CONFINED STARK EFFECT ELECTROOPTIC MODULATORS OPERATING AT 938 nm Report, May 1992 - May 1993

Michael J. Hayduk, Mark F. Krol, and Raymond K. Boncek Dec. 1993 89 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A279342; RL-TR-93-259) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Electro-optics modulators are a necessary component of emerging optical fiber based local area interconnects. One type of modulator, suitable for use in optical interconnects, is an asymmetric Fabry-Perot reflection modulator (ARM). This type of an intensity modulator uses an electro-optic material as the spacer material to balance the normally unequal front and back mirror reflectances. The quantum confined Franz-Keldysh and Stark effects shift the absorption edge of semiconductor multiple quantum well (MQW) materials to longer wavelengths in the presence of an external electric field applied perpendicular to the MQW layers, thereby changing the reflectance of the etalon. The combined coherence effects of the etalon coupled with the quantum effects of the MQW materials result in a large modulation depth and a low insertion loss. P-I-N diode structures using an In Ha As/GaAs MQW structure as the intrinsic region were fabricated for the purpose of characterizing the electro-absorption associated with different applied electric fields. Quantum confined Franz-Keldysh and Stark shifts were observed for applied electric fields as large as 6.58 x 10000 V/cm. The resulting change in the absorption coefficient was found to be -3.7 x 1000 cm to the minus 1st power which is sufficient to design a high-speed ARM with a large modulation depth and a low insertion loss. DTIC

NUMERICAL INVESTIGATION OF ONE-DIMENSIONAL HEAT-FLUX CALCULATIONS
C. F. Boyd and A. Howell 25 Oct. 1994 32 p
(AD-A286293; NSWCDD/TR-94-114) Avail: CASI HC A03/MF A01

New computer codes to determine the heat transfer rate from wind tunnel model surface temperature measurements have been developed for use in the Navy's Hypervelocity Wind Tunnel No. 9 (Tunnel 9). The existing code, which assumes one-dimensional (1D) conduction in a Cartesian coordinate system, accurately predicts 1D heat-flux when applied to flat or nearly flat geometries. Heating rates are overpredicted when the code is applied to cylindrical, spherical, and conical geometries. The over-prediction increases with larger test times and smaller radius of curvature. Heating rates are also over-predicted when the code is applied under a two-dimensional (2D) heating load that varies linearly in space. This over-prediction increases with larger test times and larger spatial gradient of heat-flux but is small for typical Tunnel 9 applications. Two new computer codes, which assume 1D conduction in cylindrical and spherical coordinates, accurately predict 1D heat-flux applied to cylindrical, spherical, and conical geometries. These two codes are online for use as a tool in evaluating heat transfer from Tunnel 9 data. DTIC

THERMOPHYSICAL PROPERTIES OF HFC-143a AND HFC-152a Final Report, 1 Apr. 1993 - 30 Jun. 1994
W. M. Haynes Jul. 1994 188 p Prepared for Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA
(Contract DE-FG02-91CE-23810; ARTI-MCLR Proj. 650-50800)
(DE95-002199; DOE/CE-23810/39) Avail: CASI HC A09/MF A02

Numerous fluids have been identified as promising alternative refrigerants, but much of the information needed to predict their behavior as pure fluids and as components in mixtures does not exist. In particular, reliable thermophysical properties data and models are needed to predict the performance of the new refrigerants in heating and cooling equipment and to design and optimize equipment to be reliable and energy efficient. The objective of this fifteen-month project has been to provide highly accurate, selected thermophysical properties data for refrigerants HFC-143a (CH3CF3) and HFC-152a (CH3CHF2) and to use these data to fit complex equations of state and detailed transport property models. The new data have filled gaps in the existing data sets and resolved problems and uncertainties that existed in and between the data sets. DOE

THEORY OF THE EXCITONIC LINESHAPE IN LOW-DIMENSIONAL STRUCTURES WITH ROUGH INTERFACES
S. Glutsch and F. Bechstedt (Friedrich-Schiller Univ., Jena, Germany.) Aug. 1994 11 p Presented at the 7th International Conference on Superlattices, Microstructures and Microdevices, Banff, Alberta, 22-26 Aug. 1994 Submitted for publication
(Contract DE-AC03-76SF-00098)
(DE95-003434; LBL-36144; CONF-940824-1) Avail: CASI HC A03/MF A01

A quantum mechanical theory of single-particle motion under the influence of a stochastic potential is presented. By solving the Dyson equation, the one-particle Green's function can be determined approximately. Gaussian distribution, an explicit expression is derived for the spectral function. The analytical results are in good agreement with numerically calculated data. The theory is applied to excitons on rough interfaces. The optical absorption of excitons on rough surfaces can be traced back to the one-particle Green's function for the center-of-mass motion. In contrast to the classical treatment, the asymmetry of the lines and the redshift of the maxima can be explained. The coefficients for linewidth and asymmetry can be expressed in terms of the excitonic wavefunction and the binary correlation function of the stochastic potential. DOE

TUNNELING OF SELF-TRAPPED STATES AND FORMATION OF A BAND
K. Yonemitsu Dec. 1993 5 p
(DE94-629001; IC-93/412) Avail: CASI HC A01/MF A01 (US Sales Only)

Tunneling of a self-trapped kink and formation of a band are studied semi classically in the one-dimensional extended Peierls-Hubbard model near half filling, considering up to Gaussian fluctuations around imaginary-time-dependent periodic motion of electrons and phonons on the stationary phase of the action derived using Slater determinants. In the strong-coupling limit of both the Holstein and attractive Hubbard models, it reproduces analytically-known effective hopping of a single bipolaron because the tunneling involves only one in this limit. The method gives new results in other general cases and is easily applied to excited or more complex systems. DOE

PHOTOREFLECTANCE AND X RAY DIFFRACTION STUDY OF SEMICONDUCTOR HETEROSTRUCTURES AND QUANTUM WELLS Ph.D. Thesis
H. Lipsanen 13 May 1994 99 p
(PB95-127049) Avail: CASI HC A05/MF A02

The modulation spectroscopy method of photoreflectance and double crystal X-ray diffraction were used for the characterization and development of III-V compound semiconductor heterostructures and quantum wells. The materials studied were based on the compounds of gallium arsenide and indium phosphide grown by molecular beam epitaxy and metalorganic vapor phase epitaxy. The structure of the grown samples were determined from the X-ray diffraction curves using theoretical calculations based on the dynamical theory of X-ray diffraction. A new procedure was developed for the determination of the period of multiple quantum well structures grown on misoriented substrates. Peculiar below-bandgap features in photoreflectance, such as interference in epitaxial layers and impurity-like transitions were studied and modeled. The effect of photovoltage in noncontact determination of electric field in semiconductor structures was determined in a novel way by studying a p-i-n diode structure. The electronic energy levels of quantum well structures were studied by photoreflectance measurements. Strained layer quantum well structures were applied to the development of high-speed semiconductor lasers. A very high modulation bandwidth of 20 GHz was obtained. NTIS

DOD SCIENCE AND ENGINEERING APPRENTICESHIP PROGRAM FOR HIGH SCHOOL STUDENTS Annual Report, 1993-1994

Richard L. Pfeffer May 1994 27 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-1825)
(AD-A280371) Avail: CASI HC A03

The 14 students that participated in the twelfth Apprenticeship Program for High School Students are profiled. Further information pertaining to each apprentice is attached at the end of the report. The major project in which the students participated during the summer was the analysis of photographic velocity data from laboratory experiments on the interaction of topography with baroclinic waves, and flows with azimuthally varying lower thermal boundary conditions. The experiments were conducted in a thermally driven rotating annulus of fluid. Derived from text

THE EFFECTS OF THREE-DIMENSIONAL GRAPHS ON DECISION MAKING M.S. Thesis

Anita E. Latin and Anthony L. Villanueva Sep. 1994 286 p
(AD-A285034; AFIT/GSM/LAS/94S-7) Avail: CASI HC A13/MF A03

The objective of this thesis was to determine whether or not, and by how much, three-dimensional graphs are more accurate and efficient than two-dimensional graphs and tables when presenting alternatives to decision makers. A graphical experiment was designed using a microcomputer. This experiment presented a business scenario to test Air Force Institute of Technology (AFIT) Professional Continuing Education (PCE) students. The experiment attempted to determine how well DoD decision makers accurately and efficiently performed elementary data collection tasks using various graphs or tables. The experiment used a randomized order within-subject factorial design with repeated measures. The factorial experiment was designed to analyze the manipulation of three factors or independent variables, anchoring, mode of presentation, and data-set, to determine their effects on the response variables of degree of accuracy, and response time (efficiency). The results of the accuracy analysis showed that in general, accuracy performance was high for most subjects regardless of the mode of presentation or the task anchoring. The timed response analysis showed that it took subjects longer to interpret three-dimensional line graphs and three-dimensional bar charts for two of the elementary data collection tasks. DTIC

PROGRAM CONTROL IN NASA: NEEDS AND OPPORTUNITIES

William E. Lilly *In* NASA, Washington, Readings in Program Control Nov. 1994 p 1-14 (For primary document see N95-20739 06-81)
Avail: CASI HC A03/MF A02

NASA has successfully managed some of this country's most complex technology and development programs. These successes have included the application of sound program control processes. The impetus for this study arose from the NASA Management Study Group findings that over time, some program control tools and disciplined procedures and processes had weakened. The Study Group recommended that steps be taken to establish a comprehensive training approach in program management, and specifically, in program control functions. This study looks at program control processes within NASA currently in use, defines a 'model' of program control functions, and provides recommendations on program control training needs and opportunities. COST ESTIMATING METHODS FOR ADVANCED SPACE SYSTEMS c83

Kelley Cyr *In its* Readings in Program Control Nov. 1994 p 15-24 (For primary document see N95-20739 06-81)
Avail: CASI HC A02/MF A02

NASA is responsible for developing much of the nation's future space technology. Cost estimates for new programs are required early in the planning process so that decisions can be made accurately. Because of the long lead times required to develop space hardware, the cost estimates are frequently required 10 to 15 years before the program delivers hardware. The system design in conceptual phases of a program is usually only vaguely defined and the technology used is so often state-of-the-art or beyond. These factors combine to make cost estimating for conceptual programs very challenging. This paper describes an effort to develop parametric cost estimating methods for space systems in the conceptual design phase. The approach is to identify variables that drive cost such as weight, quantity, development culture, design inheritance and time. The nature of the relationships between the driver variables and cost will be discussed. In particular, the relationship between weight and cost will be examined in detail. A theoretical model of cost will be developed and tested statistically against a historical database of major research and development projects. Derived from text

BUT WHAT WILL IT COST? THE HISTORY OF NASA COST ESTIMATING c83

Joseph W. Hamaker *In its* Readings in Program Control Nov. 1994 p 25-37 (For primary document see N95-20739 06-81)
Avail: CASI HC A03/MF A02

Within two years of being chartered in 1958 as an independent agency to conduct civilian pursuits in aeronautics and space, NASA absorbed either wholly or partially the people, facilities, and equipment of several existing organizations. These included the laboratories of the National Advisory Committee of Aeronautics (NACA) at Langley Research Center in Virginia, Ames Research Center in California, and Lewis Research Center in Ohio; the Army Ballistic Missile Agency (ABMA) at Redstone Arsenal Alabama, for which the team of Wernher von Braun worked; and the Department of Defense Advanced Research Projects Agency (ARPA) and their ongoing work on big boosters. These were especially valuable resources to jump start the new agency in light of the shocking success of the Soviet space probe Sputnik in the autumn of the previous year and the corresponding pressure from an impatient American public to produce some response. Along with these inheritances, there came some existing systems engineering and management practices, including project cost estimating

methodologies. This paper will briefly trace the origins of those methods and how they evolved within the agency over the past three decades.

IMPROVING COST EFFICIENCY IN LARGE PROGRAMS c83
John D. Hodge *In its* Readings in Program Control Nov. 1994 p 38-48 (For primary document see N95-20739 06-81)
Avail: CASI HC A03/MF A02

This paper examines the question of cost, from the birth of a program to its conclusion, particularly from the point of view of large multi-center programs, and suggests how to avoid some of the traps and pitfalls. Emphasis is given to cost in the systems engineering process, but there is an inevitable overlap with program management. (The terms systems engineering and program management have never been clearly defined.) In these days of vast Federal budget deficits and increasing overseas competition, it is imperative that we get more for each research and development dollar. This is the only way we will retain our leadership in high technology and, in the long run, our way of life. Derived from text

ESTIMATING THE COSTS OF HUMAN SPACE EXPLORATION c83
Humboldt C. Mandell, Jr. *In its* Readings in Program Control Nov. 1994 p 49-56 (For primary document see N95-20739 06-81)
Avail: CASI HC A02/MF A02

The plan for NASA's new exploration initiative has the following strategic themes: (1) incremental, logical evolutionary development; (2) economic viability; and (3) excellence in management. The cost estimation process is involved with all of these themes and they are completely dependent upon the engineering cost estimator for success. The purpose is to articulate the issues associated with beginning this major new government initiative, to show how NASA intends to resolve them, and finally to demonstrate the vital importance of a leadership role by the cost estimation community.

THE ADVANTAGES OF COST PLUS AWARD FEE CONTRACTS
William C. Keathley *In its* Readings in Program Control Nov. 1994 p 57-61 (For primary document see N95-20739 06-81)
Avail: CASI HC A01/MF A02

A Cost Plus Award Fee contract is the best procurement vehicle for the high-tech, one-of-a-kind, development projects that constitute most of NASA'S projects. The use of this type of contract requires more government and contractor effort than any other forms of contracts. An award fee contract is described as an arrangement whereby the government periodically awards a fee consistent with the cost, schedule and technical performance that is achieved by a contractor during a preset period with preset award fee pools. It's the only contracting method where both the government and contractor goals are closely linked. It also has a built-in mechanism to conveniently alter and emphasize program events in order to current external and internal situations. The award fee process also demands good communication between government and contractor participants.

A COST AND PERFORMANCE SYSTEM (CAPS) IN A FEDERAL AGENCY
W. F. Huseonia and P. G. Penton *In its* Readings in Program Control Nov. 1994 p 62-75 (For primary document see N95-20739 06-81)
Avail: CASI HC A03/MF A02

Cost and Performance System (CAPS) is an automated system used from the planning phase through implementation to analysis and documentation. Data is retrievable or available for analysis of cost versus performance anomalies. CAPS provides a uniform system across intra- and international elements. A common system is recommended throughout an entire cost or profit center. Data can be easily accumulated and aggregated into higher levels of tracking and reporting of cost and performance.The level and quality of performance or productivity is indicated in the CAPS model and its process. The CAPS model provides the necessary decision information and insight to the principal investigator/project engineer for a successful project management experience. CAPS provides all levels of management with the appropriate detailed level of data.

AN ANALYSIS OF COST OVERRUNS ON DEFENSE ACQUISITION CONTRACTS
David S. Christensen *In its* Readings in Program Control Nov. 1994 p 113-120 (For primary document see N95-20739 06-81)
Avail: CASI HC A02/MF A02

This article examines the history of cost overruns reported on 64 completed defense contracts. Its purpose is to formally test the observation of the Under Secretary. Results confirm the observation at the 95 percent level of confidence, and were generally insensitive to the contract type (price, cost), the contract phase (development, production), the type of weapon system (air, ground, sea), and the armed forces service (Air Force, Army, Navy) that managed the contract. After a review of terminology, concepts, and related research for those unfamiliar with the area, the methodology, results, and managerial implications are described.

PROGRAM CONTROL ON THE TROPICAL RAINFALL MEASURING MISSION
Dorothy J. Pennington and Walter Majerowicw *In its* Readings in Program Control Nov. 1994 p 121-136 (For primary document see N95-20739 06-81)
Avail: CASI HC A03/MF A02

The Tropical Rainfall Measuring Mission (TRMM), an integral part of NASA's Mission to Planet Earth, is the first satellite dedicated to measuring tropical rainfall. TRMM will contribute to an understanding of the mechanisms through which tropical rainfall influences global circulation and climate. Goddard Space Flight Center's (GSFC) Flight Projects Directorate is responsible for establishing a Project Office for the TRMM to manage, coordinate, and integrate the various organizations involved in the development and operation of this complex satellite. The TRMM observatory, the largest ever developed and built inhouse at GSFC, includes state-of-the-art hardware. It will carry five scientific instruments designed to determine the rate of rainfall and the total rainfall occurring between the north and south latitudes of 35 deg. As a secondary science objective,

TRMM will also measure the Earth's radiant energy budget and lightning.

A STRATEGY OF COST CONTROL FOR MARINER VENUS/MERCURY 1973
John R. Biggs and Walter J. Downhower *In its* Readings in Program Control Nov. 1994 p 137-153 (For primary document see N95-20739 06-81)
Avail: CASI HC A02/MF A02

The spacecraft launched by NASA on November 3, 1973 to explore Venus and Mercury proved a notable success as a development project both in space and on the ground. This article on the development points our management approaches and techniques that kept schedules and controlled costs, the intent being to stimulate thought about how to do the same with future spacecraft and payloads. The Mariner Venus/Mercury '73 (MVM '73) project kept within its originally established goals for schedule, performance, and cost. Underlying this development success was the availability of the Mariner technology. But meeting the goals demanded management determination, planning, and discipline to make optimum use of state-of-the-art technology--on the part of people at NASA, JPL, and The Boeing Co. (the contractor). Derived from text

PERFORMANCE MEASUREMENT: A TOOL FOR PROGRAM CONTROL
Nancy Abell *In its* Readings in Program Control Nov. 1994 p 147-153 (For primary document see N95-20739 06-81)
Avail: CASI HC A02/MF A02

Performance measurement is a management tool for planning, monitoring, and controlling as aspects of program and project management--cost, schedule, and technical requirements. It is a means (concept and approach) to a desired end (effective program planning and control). To reach the desired end, however, performance measurement must be applied and used appropriately, with full knowledge and recognition of its power and of its limitations--what it can and cannot do for the project manager. What is the potential of this management tool? What does performance measurement do that a traditional plan vs. actual technique cannot do? Performance measurement provides an improvement over the customary comparison of how much money was spent (actual cost) vs. how much was planned to be spent based on a schedule of activities (work planned). This commonly used plan vs. actual comparison does not allow one to know from the numerical data if the actual cost incurred was for work intended to be done. Derived from text

THE IMPACT OF PARTNERING ON CONSTRUCTION CONTRACTS M.S. Thesis
Jeffrey R. Eckstein 1994 96 p Sponsored by Army Corps of Engineers
(AD-A286588) Avail: CASI HC A05/MF A01

This thesis presents an analysis of the impact of partnering in construction contracts administered by the Seattle District, U.S. Army Corps of Engineers. Partnering was developed as a method to change the adversarial climate and costly disputes associated with administering construction contracts. Partnering attempts to avoid disputes and to complete a quality project by opening communications while developing a commitment and a shared vision between the contracting parties. This thesis analyzes the impact of partnering by comparing project performance of partnered projects with projects not using partnering. The comparison criteria include time to process modifications, time to process submittals, claims, value engineering change proposals, cost growth, time growth, and general contractor perceptions of partnering. DESIGN PRINCIPLES FOR REAL-TIME PROCESS CONTROL SYSTEMS
K. Sima'an 1994 49 p
(ISSN 0922-5641)
(PB95-132890; Rept-94-42) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

This text discusses a framework for formal requirements and design specification, and designing of Real-Time process Control systems (RTC-systems). The framework combines axiomatic with operational specification approaches for expressing respectively requirements and design. In addition, a design method is discussed and the principles and necessary instrumentation it assumes are identified. This design method enables the incremental designing of total RTC-systems by interleaved application of top-down and bottom-up designing steps. Since the goal of the text is the identification of the principles, and since it does not concern any specific subclass of RTC-systems' requirements specifications, then the principles are kept as general as possible. When necessary, these general principles can be limited to any chosen subclass of these requirements specifications. NTIS

TOTAL QUALITY MANAGEMENT PROGRAM PLANNING
P. T. Thornton and K. Spence May 1994 16 p
(Contract DE-AC05-84OR-21400)
(DE94-016862; ORNL/TM-12745) Avail: CASI HC A03/MF A01

As government funding grows scarce, competition between the national laboratories is increasing dramatically. In this era of tougher competition, there is no room for resistance to change. There must instead be a uniform commitment to improving the overall quality of our products (research and technology) and an increased focus on our customers' needs. There has been an ongoing effort to bring the principles of total quality management (TQM) to all Energy Systems employees to help them better prepare for future changes while responding to the pressures on federal budgets. The need exists for instituting a vigorous program of education and training to an understanding of the techniques needed to improve and initiate a change in organizational culture. The TQM facilitator is responsible for educating the work force on the benefits of self-managed work teams, designing a program of instruction for implementation, and thus getting TQM off the ground at the worker and first-line supervisory levels so that the benefits can flow back up. This program plan presents a conceptual model for TQM in the form of a hot air balloon. In this model, there are numerous factors which can individually and collectively impede the progress of TQM within the division and the laboratory. When these factors are addressed and corrected, the benefits of TQM become more visible. As this occurs, it is hoped that workers and management alike will grasp the 'total quality' concept as an acceptable agent for change and continual improvement. TQM can then rise to the occasion and take its rightful place as an integral and valid step in the laboratory's formula for survival. DOE

N95-21982 Vrije Univ., Amsterdam (Netherlands). Faculteit der Wiskunde en Informatica.
INTELLIGENT INTERACTIVE PROJECT MANAGEMENT SYSTEM
F. J. Juengen and W. Kowalczyk Dec. 1993 49 p
(PB95-132684) Avail: Issuing Activity (National Technical Information Service (NTIS))

This paper presents a general framework for developing complex systems for tasks like project management, dynamic scheduling, and design. The framework is based on the concept of interactively solving meta-constraint satisfaction problems, and it uses a number of basic notions from Artificial Intelligence: states, search space, operators that modify the states, revision mechanisms and constraint solving. Within this framework, a generic project management support system has been designed and an instantiation of it to a planning and scheduling system for the building industry is presented. A number of modules have been implemented and configured into a highly interactive scheduling system for network planning. The system can be extended by modules supporting such activities of project management as management of resources and project monitoring. By adding knowledge bases with knowledge related to hierarchical construction of project networks and libraries of realized projects, the usefulness of the system can be increased even further. NTIS

TECHNOLOGY TRANSFER: IMPROVING THE USE OF COOPERATIVE R/D AGREEMENT AT DOE'S CONTRACTOR-OPERATED LABORATORIES. REPORT TO CONGRESSIONAL REQUESTERS
Apr. 1994 16 p
(GAO/RCED-94-91; B-253616) Avail: CASI HC A03/MF A01; GAO, PO Box 6015, Gaithersburg, MD 20884-6015 HC

A comparison of various approaches made by the Department of Energy to those made by the Army and the Department of Commerce's National Institute of Standards and Technology to implement cooperative research and development agreements is presented. The DOE's process for implementing cooperative research and development agreements was compared to the approaches used by the Army and the Department of Commerce's National Institute of Standards and Technology to determine why some federal laboratories had entered into more agreements than DOE's laboratories. The study compared the different processes for implementing cooperative R&D agreements on the level of laboratory resources available for these agreements and on the time and resources used to implement or begin the collaboration. DOE's centralized funding process for implementing most of its cooperative research and development agreements is examined. This report reflects data collected in early 1993 from the National Institute of Standards and Technology, the Army, and the Department of Energy. DOE officials have recognized the need to improve their processes for implementing cooperative R&D agreements and have taken steps to make these procedures more efficient. For example, in early 1994 DOE began using a simplified model cooperative R&D agreement that it expects will speed up its approval process and initiated a 'block funding' pilot program that will allow more cooperative R&D agreement selections to be made at the laboratory and regional office level. NEW METHOD FOR INTEGRITY CONSTRAINT CHECKING IN DEDUCTIVE DATABASES
R. Seljee Mar. 1994 44 p
(PB95-110672) Avail: CASI HC A03/MF A01

In the literature, several integrity checking methods for updates in deductive databases are described. All of these methods try to instantiate the specified integrity constraints with the update in order to constrain the full check to only a relevant part of the database. Globally, they can be divided in two major classes of methods; methods based on 'induced updates' and methods based on 'potential updates'. In this article a new method will be presented. This method represents also a new class of methods. While in the first two classes one has to generate induced updates and potential updates respectively, even if they are not relevant to any of the constraints, the new method, which will be called the 'method based on inconsistency rules', does not have this drawback. Therefore, the proposed method is potentially far more efficient than any other method based on induced updates or potential updates. NTIS

MIGRATING THE FACILITY PROFILE INFORMATION MANAGEMENT SYSTEM INTO THE WORLD WIDE WEB
R. E. Kero and C. E. Swietlik 1994 6 p Presented at the 11th Office Information Technology Conference, Chicago, IL, 23-25 Aug. 1994
(Contract W-31-109-eng-38)
(DE94-018367; ANL/DIS/CP-83918; CONF-940873-2) Avail: CASI HC A02/MF A01

The Department of Energy - Office of Special Projects and Argonne National Laboratory (ANL), along with the Department of Energy - office of Scientific and Technical Information have previously designed and implemented the Environment, Safety and Health Facility Profile Information

Management System (FPIMS) to facilitate greater efficiency in searching, analyzing and disseminating information found within environment, safety and health oversight documents. This information retrieval based system serves as a central repository for full-text electronic oversight documents, as well as a management planning and decision making tool that can assist in trend and root cause analyses. Continuous improvement of environment, safety and health programs are currently aided through this personal computer-based system by providing a means for the open communication of lessons learned across the department. Overall benefits have included reductions in costs and improvements in past information management capabilities. Access to the FPIMS has been possible historically through a headquarters-based local area network equipped with modems. Continued demand for greater accessibility of the system by remote DOE field offices and sites, in conjunction with the Secretary of Energy' s call for greater public accessibility to Department of Energy (DOE) information resources, has been the impetus to expand access through the use of Internet technologies. Therefore, the following paper will discuss reasons for migrating the FPIMS system into the World Wide Web (Web), various lessons learned from the FPIMS migration effort, as well as future plans for enhancing the Web-based FPIMS. THE DESIGN AND IMPLEMENTATION OF THE FUNCTIONAL/DAPLEX DATA INTERFACE FOR THE MULTIMODEL AND MULTILINGUAL DATABASE SYSTEM M.S. Thesis

William A. Demers and Jon M. Rogelstad Mar. 1994 197 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(AD-A280131) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The Multi-Lingual and Multi-Model Database System (MDBS), at the Naval Postgraduate School, is the only database system in which five different database model interfaces operate on a single computer system. The purpose of the MDBS is to prove that multiple database models can coexist and share data within a single computer system. The MDBS provides a platform in which diverse database models can share data, via access to other models' base data, stored in the MDBS common format. The problem was that a Functional database model had not previously been implemented on the MDBS. The goal of this thesis was to provide a Functional/DAPLEX interface for the MDBS. The approach was to design and implement a set of programs to encapsulate the Functional/DAPLEX language as introduced by D.W. Shipman in 1981. It is imperative that the interface maintain the look, feel and characteristics of the Functional data model. The result is a set of programs, written in C, which implement a Functional/DAPLEX interface, thus a sixth interface, for the MDBS. The programs parse DAPLEX data definition language and data manipulation language constructs, convert them to an MDBS common format, store the data with other models' base data and can reconvert MDBS common data back to a functional form. This report describes similarities and differences between undergraduate and graduate aerospace engineering and science students in the context of two general aspects of the educational experience. First, we explore the extent to which students differ regarding the factors that lead to the choice of becoming an aerospace engineer or a scientist, current satisfaction with that choice, and career-related goals and objectives. Second, we look at the technical communication skills, practices, habits, and training of aerospace engineering and science students. The reported data were obtained from a survey of students enrolled in aerospace engineering and science programs at universities in India, Japan, Russia, and the United Kingdom. The surveys were undertaken as part of the NASA/DOD Aerospace Knowledge Diffusion Research Project. Data are reported for the following categories: student demographics; skill importance, skill training, and skill helpfulness; collaborative writing; computer and information technology use and importance, use of electronic networks; use and importance of libraries and library services; use and importance of information sources and products; use of foreign language technical reports; and foreign language (reading and speaking) skills. NASA/DOD AEROSPACE KNOWLEDGE DIFFUSION RESEARCH PROJECT. REPORT 31: THE TECHNICAL COMMUNICATIONS PRACTICES OF US AEROSPACE ENGINEERS AND SCIENTISTS: RESULTS OF THE PHASE 1 SME MAIL SURVEY

Thomas E. Pinelli, Rebecca O. Barclay (Rensselaer Polytechnic Inst., Troy, NY.), and John M. Kennedy (Indiana Univ., Bloomington, IN.) Dec. 1994 52 p

(RTOP 505-90-00)

(NASA-TM-109169; NAS 1.15:109169) Avail: CASI HC A08/MF A02

The U.S. government technical report is a primary means by which the results of federally funded research and development (R&D) are transferred to the U.S. aerospace industry. However, little is known about this information product in terms of its actual use, importance, and value in the transfer of federally funded R&D. To help establish a body of knowledge, the U.S. government technical report is being investigated as part of the NASA/DOD Aerospace Knowledge Diffusion Research Project. In this report, we summarize the literature on technical reports and provide a model that depicts the transfer of federally funded aerospace R&D via the U.S. government technical report. We present results from our investigation of aerospace knowledge diffusion vis-a-vis the U.S. government technical communications practices of U.S. aerospace engineers and scientists affiliated with, not necessarily belonging to, the Society of Manufacturing Engineers (SME). USING LOCAL OPTIMALITY CRITERIA FOR EFFICIENT INFORMATION RETRIEVAL WITH REDUNDANT INFORMATION FILTERS Progress Report, Jan. - Dec. 1993

Neil C. Rowe Mar. 1994 48 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(AD-A279603; NPS-CS-94-004) Avail: CASI HC A03

We consider information retrieval when the data, for instance multimedia, is computationally expensive to fetch. Our approach uses information filters to considerably narrow the universe of possibilities before retrieval. Then decisions must be made about the necessity, order, and concurrent processing of proposed filters (an execution plan). We develop simple polynomial-time local criteria for optimal execution plans, and show that most forms of concurrency are suboptimal with information filters. Although the general problem of finding an optimal execution plan is likely exponential in the numbers of filters, we show experimentally that our local optimality criteria, used in a polynomial-time algorithm, nearly always find the global optimum with 15 filters or less, sufficient number of filters for most applications. Our methods do not require special hardware and avoid the high processor idleness that is characteristic of massive-parallelism solutions to this problem. We apply our ideas to an important application, information retrieval of captioned data using natural-language understanding, a problem for which the natural-language processing can be the bottleneck if not implemented well. TIME DOMAIN SPECTRAL HOLE-BURNING STORAGE Final Report, 30 Sep. 1992 - 29 Dec. 1993

Michael Jefferson 2 May 1994 18 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Contract F49620-92-C-0066)

(AD-A279912; AFOSR-94-0312TR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This work achieved several substantial results. A highly stabilized laser system suitable for many detailed studies of data storage phenomena was constructed and made to work. This laser was essential for the investigations which followed. Using the stabilized laser, a real time correlator was demonstrated, which correctly identified all occurences of a test sequence imbedded in random data. This correlator is the first demonstration of the use of phase modulation to store and retrieve data in time domain hole-burning. In the frequency domain, narrow holes were burned and scanned, and information storage at a spectral density exceeding 50,000 bits per spot was demonstrated, with perfect recall and excellent signal to noise. We have also made the first demonstration of a novel technique for storing and retrieving phase modulated data streams with time domain spectral hole-burning. This demonstration has been disclosed for patent purposes. DTIC

DOWNSIZING INFORMATION SYSTEMS: FRAMING THE ISSUES FOR THE OFFICE OF NAVAL INTELLIGENCE (ONI) M.S. Thesis
Peter M. Hutson Mar. 1994 115 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A279888) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Downsizing information systems from large and centralized mainframe computing architectures to smaller and distributed desktop systems is one of the most difficult and critical strategic decisions facing both corporate and government organizations. Vendor advertisements and media hype often boast of huge cost savings and greater flexibility while retaining mainframe-strength performance. Cryptic terminology, biased vendor assistance, and rapidly changing technology complicate already difficult decisions. This thesis provides an executive summary for middle and top managers requiring a survey of the major downsizing issues. It provides an overview of architectural trends that are helping to fuel the downsizing process to include an emphasis on the client/server paradigm, the evolving roles of the mainframe and desktop computers, and innovative architectural software tools. An analysis of management and technical risks according to organizational, performance, and cost factors also focuses on such critical considerations as business process reengineering, open systems, flexibility, throughput, security, conversion costs, and life-cycle costs of downsized systems. Finally, this thesis 'frames' the issues for the Office of Naval Intelligence and DOD by highlighting and outlining some general guidelines that may be used to intelligently plan strategy and make key organizational decisions. TRANSLATION OF THE DATA FLOW QUERY LANGUAGE FOR THE MULTIMODEL, MULTIBACKEND DATABASE SYSTEM M.S. Thesis
Nancy C. Free Sep. 1994 74 p
(AD-A285978) Avail: CASI HC A04/MF A01

This thesis involved the design and translation of the Data Flow Query Language (DFQL) for the Multi-Lingual, Multi-Backend Database System (MDBS). The MDBS is a database system that can effectively support multiple data models and their corresponding data manipulation languages. The problem was that MDBS interfaces are text-based, and not very user-friendly. The approach taken to solve this interface problem was to design and translate the DFQL for implementation on the MDBS. DFQL was designed to improve and extend SQL, the data manipulation language associated with the relational data model. It uses a graphical interface based on the data flow paradigm. This translation would extend the MDBS by allowing a graphical interface to be implemented, whereas currently a user can only access the system with text-based interfaces. The result of this thesis is the development of the DFQL to ABDL translator. The subsequent implementation of this translator on the MDBS would be a user-oriented enhancement to the current system. In addition, further improvements to the MDBS should be made, such as allowing the use of additional data types (currently constrained to string and integer) and the ability to create views. These changes would allow all the benefits from DFQL, such as orthogonality, language extensibility and incremental querying to be achieved and made available to the user. DTIC

(DE95-001008; LA-UR-94-3307; CONF-9410141-2) Avail: CASI HC A02/MF A01

This paper offers an overview of current efforts at the Research Library, Los Alamos National Laboratory, (LANL), to develop digital library services. Current projects of LANL's Library without Walls initiative are described. Although the architecture of digital libraries generally is experimental and subject to debate, one principle of LANL's approach to delivering library information is the use of Mosaic as a client for the Research Library's resources. Several projects under development have significant ramifications for delivering library services over the Internet. Specific efforts via Mosaic include support for preprint databases, providing access to citation databases, and access to a digital image database of unclassified Los Alamos technical reports. DOE

Avail: CASI HC A02/MF A01

The Safeguards Information Management System initiative is a program of the Department of Energy's (DOE) Office of Arms Control and Nonproliferation aimed at supporting the International Atomic Energy Agency's (IAEA) efforts to strengthen safeguards through the enhancement of information management capabilities. The DOE hopes to provide the IAEA with the ability to correlate and analyze data from existing and new sources of information, including publicly available information, information on imports and exports, design information, environmental monitoring data, and non-safeguards information. The first step in this effort is to identify and define IAEA requirements. In support of this, we have created a users' requirements document based on interviews with IAEA staff that describes the information management needs of the end user projected by the IAEA, including needs for storage, retrieval, analysis, communication, and visualization of data. Also included are characteristics of the end user and attributes of the current environment. This paper describes our efforts to obtain the required information. We discuss how to accurately represent user needs and involve users for an international organization with a multi-cultural user population. We describe our approach, our experience in setting up and conducting the interviews and brainstorming sessions, and a brief discussion of what we learned. DOE

THE ENERGY SCIENCE AND TECHNOLOGY DATABASE ON A LOCAL LIBRARY SYSTEM: A CASE STUDY AT THE LOS ALAMOS NATIONAL RESEARCH LIBRARY

I. S. Holtkamp 1994 12 p Presented at the Office of Scientific and Technical Information INFOTECH, Oak Ridge, TN, 25-26 Oct. 1994
(Contract W-7405-eng-36)
(DE95-001009; LA-UR-94-3308; CONF-9410141-3) Avail: CASI HC A03/MF A01

This paper presents an overview of efforts at Los Alamos National Laboratory to acquire and mount the Energy Science and Technology Database (EDB) as a citation database on the Research Library's Geac Advance system. The rationale for undertaking this project and expected benefits are explained. Significant issues explored are loading non-USMARC records into a MARC-based library system, the use of EDB records to replace or supplement in-house cataloging of technical reports, the impact of different cataloging standards and database size on searching and retrieval, and how integrating an external database into the library's online catalog may affect staffing and workflow. KNOWLEDGE REFINEMENT IN A REFLECTIVE ARCHITECTURE

Yolanda Gil Jun. 1994 16 p
(Contract DABT63-91-C-0025)
(AD-A286027; ISI/RR-94-378) Avail: CASI HC A03/MF A01

A knowledge acquisition tool should provide a user with maximum guidance in extending and debugging a knowledge base, by preventing inconsistencies and knowledge gaps that may arise inadvertently. Most current acquisition tools are not very flexible in that they are built for a predetermined inference structure or problem-solving mechanism, and the guidance they provide is specific to that inference structure and hard-coded by their designer. This paper focuses on EXPECT, a reflective architecture that supports knowledge acquisition based on an explicit analysis of the structure of a knowledge-based system, rather than on a fixed set of acquisition guidelines. EXPECT's problem solver is tightly integrated with LOOM, a state-of-art knowledge representation system. Domain facts and goals are represented declaratively, and the problem solver keeps records of their functionality within the task domain. When the user corrects the system's knowledge. EXPECT tracks any possible implications of this change in the overall system and cooperates with the user to correct any potential problems that may arise. The key to flexibility of this knowledge acquisition tool is that it adapts its guidance as the knowledge bases evolve in response to changes introduced by the user. DTIC

USE OF OPERATIONS RESEARCH TECHNIQUES IN DEDUCTIVE DATABASES Thesis

M. D. E. vanderLee 1994 122 p
(PB95-135349; ISBN-90-9007222-5) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

The thesis is about deductive databases that use operations research techniques. The interconnection between model based logic programming and operations research will be studied. In the first two chapters we give an introduction to the basics of logic programming and operations research. In the next three chapters three classes of programs are considered. In Chapter 3 we deal with definite programs, i.e. programs containing only Horn rules. In Chapter 4 we concentrate on the class of so called disjunctive programs. In Chapter 5 we concentrate on so called normal programs. For these programs the well-founded model can be computed efficiently, but the stable models are expensive to compute. NTIS

ABBREVIATIONS AND ACRONYMS
1994 131 p
(NASA-TM-110506; NAS 1.15:110506) Avail: CASI HC A07/MF A02

This booklet provides a partial list of acronyms, abbreviations, and other short word forms, including their definitions, used in documents at the Goddard Space Flight Center (GSFC). This list does not preclude the use of other short forms of less general usage, as long as these short forms are identified the first time they appear in a document and are defined in a glossary in the document in which they are used. This document supplements information in the GSFC Scientific and Technical Information Handbook (GHB 2200.2/April 1989). It is not intended to contain all short word forms used in GSFC documents; however, it was compiled of actual short forms used in recent GSFC documents. The entries are listed first, alphabetically by the short form, and then again alphabetically by definition. Derived from text

SELECTIVE POLYGON MAP DISPLAY METHOD Patent
Thomas F. Wescott, inventor (to Navy), Lawrence E. McCleary, inventor (to Navy), and David A. Nation, inventor (to Navy) 23 Aug. 1994 619 p Filed 31 Jan. 1990
(AD-D016518; US-Patent-5,341,463; US-Patent-Appl-SN-473258; US-Patent-Class-395-12.9) Avail: US Patent and Trademark Office

This patent discloses signal transformations of inputted data brought about new subroutines in combination with other subroutines to display world maps or other display items with the unique capability of performing the following functions in complete generality. (1) Arbitrary selection of map center and coverage, including global displays, (2) filling of all land and lake areas defined by polygons composed of an arbitrary number of vertices, (3) clipping of map features and overlays at map boundaries and poles, (4) selection from any of nineteen currently implemented map projections with provision to install any other projection topologically similar to an oblique conic, (5) calculation of latitude longitude for any point on a map without the need for inverse mapping equations, and (6) an efficient method of plotting polyline segments along great circles. These are a number of feature functions provided by this inventive concept. The software could potentially be used with any digital global geographic data base such as World Data Bank II (WDBII), a geographic information system or other data base where polylines are used to depict linear and/or areal features. Polygon (region filled) maps and other display items can be constructed from any data base from which closed polygons can be extracted directly, or constructed via additional processing. DTIC

NASA/DOD AEROSPACE KNOWLEDGE DIFFUSION RESEARCH PROJECT. PAPER 48: VALUING INFORMATION IN AN INTERACTIVE ENVIRONMENT
Herbert R. Brinberg (Parnassus Associates International, New York, NY.), Thomas E. Pinelli, and Rebecca O. Barclay (Electronic Information Age, Inc., Portsmouth, VA.) May 1995 16 p Presented at the International Congress on the Economics of Information, Lyon, France, 18-20 May 1995; sponsored by the French Higher National School of Information Science and Library
(NASA-TM-110448; NAS 1.15:110448) Avail: CASI HC A03/MF A01

Consideration effort has been devoted over the past 30 years to developing methods and means of assessing the value of information. Two approaches - value in exchange and value in use - dominate; however, neither approach enjoys much practical application because validation schema for decision-making is missing. The approaches fail to measure objectively the real costs of acquiring information and the real benefits that information will yield. Moreover, these approaches collectively fail to provide economic justification to build and/or continue to support an information product or service. In addition, the impact of Cyberspace adds a new dimension to the problem. A new paradigm is required to make economic sense in this revolutionary information environment. In previous work, the authors explored the various approaches to measuring the value of information and concluded that, in large measure, these methods were unworkable concepts and constructs. Instead, they proposed several axioms for valuing information. Most particularly they concluded that the 'value of information cannot be measured in the absence of a specific task, objective, or goal.' This paper builds on those axioms and describes under which circumstances information can be measured in objective and actionable terms. This paper also proposes a methodology for undertaking such measures and validating the results. Author

INFORMATION CLUSTERING FOR BETTER DECISION-MAKING Final Report
S. S. Kirschenbaum 2 May 1994 24 p
(AD-A286292; NUWC-NPT-TR-10372) Avail: CASI HC A03/MF A01

Chunking of information in memory is one of the distinguishing features of expertise. Thus, it is hypothesized that providing information displays that cluster and integrate information according to the expert decision-maker's task leads to more efficient decision performance. Three information format schemes: alphabetical listing, functional partitioning, and integrative clustering were tested for a complex, time-limited task with conflicting goals. The integrative clustering led to the most efficient performance. Functional partitioning required greater effort for limited performance improvement. Results are discussed in terms of implications for display designers. DTIC

TAKING AIM: THE MANAGEMENT OF SCIENTIFIC AND TECHNICAL INFORMATION AT ARGONNE NATIONAL LABORATORY
Mark Masek, Maria DiStravolo, and Richard Dominiak 1994 10 p Presented at the Office of Scientific and Technical Information INFOTECH 1994, Oak Ridge, TN, 25-26 Oct. 1994
(Contract W-31-109-eng-38)
(DE94-019279; ANL/IPD/CP-83520; CONF-9410141-1) Avail: CASI HC A02/MF A01

Four years ago, Argonne National Laboratory tracked its publications the old-fashioned way - typing information on index cards, making photocopies of the cards and sorting them according to title, author, report number and keywords. Now, the Argonne Information Management (AIM) system collects document clearance and publication information in an integrated electronic system that tracks the laboratory's publications along with associated cost records, and offers a publicly available interface to the data so authors and divisions can create their own publications lists. This presentation will outline the steps taken to develop this system; the benefits to the overall publication review process; how the system meets the needs of a variety of customers, from Argonne authors to DOE and beyond, and the plans for future enhancements. METHOD OF RETRIEVING AND STORING COMPUTER PERIPHERAL DATA Patent Application
Stephen J. Amuro, inventor (to Navy) and Paul J. Giorgio, inventor (to Navy) 29 Mar. 1994 21 p
(AD-D016251; US-Patent-Appl-SN-219554) Avail: CASI HC A03/MF A01

An improved method of having a Small Computer System Interface (SCSI) controller provide a logical connection between a plurality of host processors using a single SCSI initiator is presented. The controller contains removable host adapters for connection to any type of host processor interface. When a host processor requests status information of a target device, that status information is passed to the requesting processor and subsequently stored in the controller and made available to all other host processors. A GRADED APPROACH TO ISO 9000 IMPLEMENTATION FOR RECORDS MANAGERS
C. E. Pasterczyk 1994 10 p Presented at the 39th Association of Records Managers and Administrators International Annual Conference, Toronto, Ontario, 25-29 Sep. 1994
(Contract DE-AC04-94AL-85000)
(DE94-017409; SAND-93-2610C; CONF-9409191-1) Avail: CASI HC A02/MF A01

ISO 9000 is a series of quality system standards developed by Technical Committee 176 of the International Standards Organization. The series includes three standards, ISO 9001 'Quality systems-Model for quality assurance in design/development, production, installation and serving,' ISO 9002 'Quality systems-Model for quality assurance in production and installation,' ISO 9003 'Quality systems-Model for quality assurance in final inspection and test,' and two guidelines, ISO 9000 'Quality management and quality assurance standards' and ISO 9004 'Quality management and quality system elements-Guidelines.' In companies with quality programs already in place, the structure of the ISO series lends itself to augmenting those policies, procedures, and instructions where problems exist or where the risks of failure are greater. The objectives of this paper are to provide a basic familiarity to ISO 9000 and quality assurance concepts; provide a higher level of familiarity to the records management and document control portions of the ISO 9000 series; and to discuss a graded approach to meeting the intent of ISO 9000. INTERPRETATION OF HRTEM IMAGES BY IMAGE SIMULATION: AN INTRODUCTION TO THEORY AND PRACTICE
M. A. OKeefe Aug. 1994 84 p Presented at the Microscopy Society of America and Microbeam Analysis Society Joint Meeting, New Orleans, LA, 31 Jul. - 5 Aug. 1994
(Contract DE-AC03-76SF-00098)
(DE95-003422; LBL-35348; CONF-940753-24) Avail: CASI HC A05/MF A01

This tutorial describes the use of image simulation as an aid to interpretation of high-resolution transmission electron microscope images.

Topics include some image processing as well as image simulation. Image processing is the manipulation of experimental images in order to extract some desired information. Image simulation is the generation of a computed or simulated image from a model structure. It requires a detailed knowledge of the process of image formation in the high-resolution transmission electron microscope. This tutorial concentrates on image simulation, with examples of image processing appearing only as required as illustrations. Because this is an introduction, the theory of image simulation is described, but not explored in depth. The practice of image simulation is covered in sufficient detail to enable the student to understand the functions of the various steps in the computations, and the parameters necessary for their evaluation. USING GEOGRAPHICAL DATA BROWSERS IN A NETWORKED ENVIRONMENT
H. E. Mackey, P. J. Bresnaham (South Carolina Univ., Columbia, SC.), D. J. Cowen (South Carolina Univ., Columbia, SC.), G. D. Ehler (South Carolina Univ., Columbia, SC.), E. King (South Carolina Univ., Columbia, SC.), W. L. Shirley (South Carolina Univ., Columbia, SC.), and T. White (South Carolina Univ., Columbia, SC.) 1994 16 p Presented at the International Symposium on Spatial Data Handling, Edinburgh, Scotland, 8 Sep. 1994
(Contract DE-AC09-89SR-18035)
(DE94-017809; WSRC-MS-94-0394; CONF-9409190-1) Avail: CASI HC A03/MF A01

The rapid development of spatial information technology has promoted a large variety of applications. The use of diverse, datasets in these applications has often been limited to single-platform analysis and distribution. Recent improvements in networking capabilities have led to the possibility of cross-platform access to geographical information and improved interoperability. To promote access to various databases and limit unsecured use of datasets across networks, spatial data browsers have been developed to allow simple analysis of data void of permanent update. Furthermore, applicable network configurations have greatly improved dissemination of views of existing data and individual use of distributed heterogeneous databases. Various user interfaces and networking applications can be combined to maximize data flow between storage media and data browsing software. This paper reviews the use of such distributed data browsing systems and the characteristics of platform-specific access and performance. Distinct discussions will review both geographical browser interface and networking services components. The selection of networking and software solutions was based on the development of a data browsing system for a twenty-user environment of mixed platforms (Unix, DOS, and Macintosh). Seventy percent of the user environment, however, was Macintosh-based. DOE

The specification language LCM (Language for Conceptual Modeling) is used to specify a part of the university library document circulation system of the Free University. LCM is version 3 of a language previously called CMSL (Conceptual Model Method for Modeling). The authors draw a number of conclusions about the types of axioms that are encountered in the case study, as well as about the kinds of extensions that should be added to LCM to facilitate easier and more expressive modeling of this case study. A CONCEPTUAL APPROACH TO OBJECT-ORIENTED DATA MODELING M.S. Thesis
Gerald B. Barnes Sep. 1994 98 p
(AD-A286048) Avail: CASI HC A05/MF A02

Object-oriented data modeling is starting to replace the relational model for many recently emerging database applications. The complex nature of these databases precludes mapping of their data directly into a tabular relational structure. Current object-oriented data modeling lacks the standardization and mathematical soundness of the relational model. This thesis addresses this problem by proposing a conceptual data model called OPERA (Object Paradigm / Entity-Relationship Approach). OPERA incorporates the static features of the Entity-Relationship Model with the dynamic properties of object-orientation. In addition to OPERA, an object-oriented extension to the graphical query language GORDAS (Graph-Oriented Data Selection) is proposed. To demonstrate the effectiveness of the proposed model, we will model a United States combat systems support database, the EWIRDB (Electronic Warfare Integrated Reprogramming Database). We map the EWIRDB from its basic relational format to an object schema and then to an OPERA graph. Finally, this conceptual schema is mapped to a GORDAS schema graph and queries are performed on the database. OPERA is conceptually superior to the ER Model and its object-oriented variant, the Enhanced Entity-Relationship Model (EER) Model. We demonstrate this by representing methods as relationship types, which the ER and EER models are incapable of OPERA also aids in query formulation for visual query languages such as GORDAS by providing a query graph mapping template. 83 ECONOMICS AND COST ANALYSIS

Includes cost effectiveness studies.

N95-19939 Tilburg Univ. (Netherlands). Faculty of Economics.
PATTERNS OF FINANCIAL CHANGE IN THE OECD AREA
H. vanGemert and N. Gruijters Feb. 1994 37 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB95-110979; FEW-641) Avail: CASI HC A03

This paper measures the nature and degree of global financial change by studying interest rate differentials among OECD (Organization for Economic Cooperation and Development) countries. First, a simple portfolio model illuminates the various determinants of international capital mobility. The framework is used to deduce the characteristics of three fundamentally different but analytically connected patterns of financial change: financial integration, asset substitution and monetary integration. Next, the empirical analysis aims at quantifying these patterns for two regions: the FixWorld and the FlexWorld, which differ as to their exchange rate commitment. The results are discussed against the background of some dominant institutional changes in the countries concerned. The policy implications are presented in a monetary policy conflict triangle. NTIS

This publication is intended to foster the aim of the NASA Technology Transfer Program by heightening awareness of the NASA technology available for reapplication and its potential for public benefit. The publication is organized in three main sections. The first section, Aerospace Aims, is an illustrated summary of NASA's major aeronautical and space programs, their goals and directions, their contributions to American scientific and technological growth, and their potential for practical benefit. The second section, Technology Twice Used, is a representative selection of new products and processes adapted from technology originally developed for NASA mainline programs, underlying the broad diversity of spinoff applications and the social/economic benefits they provide. The third section, Technology Transfer, is a description of the mechanisms employed to encourage and facilitate practical application of new technologies developed in the course of NASA activities. SCIENCE WITH HIGH SPATIAL RESOLUTION FAR-INFRARED DATA
Susan Terebey, ed. and Joseph M. Mazzarella, ed. Apr. 1994 183 p
Workshop held in Pasadena, CA, 14-16 Jun. 1993
(Contract NAS7-918)
(NASA-CR-197353; JPL-Publ-94-5; NAS 1.26:197353) Avail: CASI HC A09/MF A02

The goal of this workshop was to discuss new science and techniques relevant to high spatial resolution processing of far-infrared data, with particular focus on high resolution processing of IRAS data. Users of the maximum correlation method, maximum entropy, and other resolution enhancement algorithms applicable to far-infrared data gathered at the Infrared Processing and Analysis Center (IPAC) for two days in June 1993 to compare techniques and discuss new results. During a special session on the third day, interested astronomers were introduced to IRAS HIRES processing, which is IPAC's implementation of the maximum correlation method to the IRAS data. Topics discussed during the workshop included: (1) image reconstruction; (2) random noise; (3) imagery; (4) interacting galaxies; (5) spiral galaxies; (6) galactic dust and elliptical galaxies; (7) star formation in Seyfert galaxies; (8) wavelet analysis; and (9) supernova remnants. For individual titles, see N95-21750 through N95-21773.

HIRES AND BEYOND c82
John W. Fowler and H. H. Aumann *In its* Science with High Spatial Resolution Far-Infrared Data Apr. 1994 p 1-10 (For primary document see N95-21749 06-88)
Avail: CASI HC A02/MF A02

The High-Resolution image construction program (HiRes) used at IPAC is based on the Maximum Correlation Method. After HiRes intensity images are constructed from IRAS data, additional images are needed to aid in scientific interpretation. Some of the images that are available for this purpose show the fitting noise, estimates of the achieved resolution, and detector track maps. Two methods have been developed for creating color maps without discarding any more spatial information than absolutely necessary: the 'cross-band simulation' and 'prior-knowledge' methods. These maps are demonstrated using the survey observations of a 2 x 2 degree field centered on M31. Prior knowledge may also be used to achieve super-resolution and to suppress ringing around bright point sources observed against background emission. Tools to suppress noise spikes and for accelerating convergence are also described. Author

MEM APPLICATION TO IRAS CPC IMAGES c82
A. P. Marston *In* JPL, Science with High Spatial Resolution Far-Infrared Data Apr. 1994 p 11-16 (For primary document see N95-21749 06-88)
Avail: CASI HC A02/MF A02

A method for applying the Maximum Entropy Method (MEM) to Chopped Photometric Channel (CPC) IRAS additional observations is illustrated. The original CPC data suffered from problems with repeatability which MEM is able to cope with by use of a noise image, produced from the results of separate data scans of objects. The process produces images of small areas of sky with circular Gaussian beams of approximately 30 in. full width half maximum resolution at 50 and 100 microns. Comparison is made to previous reconstructions made in the far-infrared as well as morphologies of objects at other wavelengths. Some projects with this dataset are discussed. Author

AN ASSESSMENT OF IMAGE RECONSTRUCTION FROM BALLOON-BORNE AND THE IRAS DATA c82
S. K. Ghosh, B. Das, T. N. Rengarajan, and R. P. Verma *In* JPL, Science with High Spatial Resolution Far-Infrared Data Apr. 1994 p 17-22 (For primary document see N95-21749 06-88)
Avail: CASI HC A02/MF A02

Angular resolution and structural information from the far-infrared mapping of astronomical sources (Galactic star forming regions, spiral galaxies, etc.) made using the TIFR 1 m balloon-borne telescope and the IRAS have been compared. The effective wavelengths of the TIFR two-band photometer are 58 and 150 microns. From IRAS, the survey COADD data, additional observations (AO's) made with the survey detectors with different Macros (DPS, DSD, DPM), as well as the chopped photometric channel (CPC) data have been considered here. The observed signals have been processed using different deconvolution strategies, either based on a maximum entropy method (MEM) developed at TIFR or the HiRes package developed at IPAC. Relative merits of each of these, under different conditions of signal to noise ratio, are highlighted. The following sources have been selected for illustration: Carina complex, W31 region, IRAS 10361-5830 (all Galactic), M101 and M81 (extragalactic). The main conclusions are: far-infrared maps from MEM deconvolution of balloon-borne data have the best angular resolution; MEM deconvolution of IRAS AO's gives resolution comparable to HiRes but with less amount of computation, though the dynamic range in MEM maps is less than in HiRes maps. IN SEARCH OF RANDOM NOISE c82
Do Kester and Tj. Romke Bontekoe (European Space Agency. European Space Research and Technology Center, ESTEC, Noordwijk, Netherlands.) *In* JPL, Science with High Spatial Resolution Far-Infrared Data Apr. 1994 p 23-31 (For primary document see N95-21749 06-88)
Avail: CASI HC A02/MF A02

In order to make the best high resolution images of IRAS data it is necessary to incorporate any knowledge about the instrument into a model: the IRAS model. This is necessary since every remaining systematic effect will be amplified by any high resolution technique into spurious artifacts in the images. The search for random noise is in fact the never-ending quest for better quality results, and can only be obtained by better models. The Dutch high-resolution effort has resulted in HIRAS which drives the MEMSYS5 algorithm. It is specifically designed for IRAS image construction. A detailed description of HIRAS with many results is in preparation. In this paper we emphasize many of the instrumental effects incorporated in the IRAS model, including our improved 100 micron IRAS response functions. Author

PUSHING THE LIMITS OF SPATIAL RESOLUTION WITH THE KUIPER AIRBORNE OBSERVATORY c82
Daniel Lester *In* JPL, Science with High Spatial Resolution Far-Infrared Data Apr. 1994 p 33-44 (For primary document see N95-21749 06-88)
Avail: CASI HC A03/MF A02

The study of astronomical objects at high spatial resolution in the far-IR is one of the most serious limitations to our work at these wavelengths, which carry information about the luminosity of dusty and obscured sources. At IR wavelengths shorter than 30 microns, ground based telescopes with large apertures at superb sites achieve diffraction-limited performance close to the seeing limit in the optical. At millimeter wavelengths, ground based interferometers achieve resolution that is close to this. The inaccessibility of the far-IR from the ground makes it difficult, however, to achieve complementary resolution in the far-IR. The 1983 IRAS survey, while extraordinarily sensitive, provides us with a sky map at a spatial resolution that is limited by detector size on a spatial scale that is far larger than that available in other wavelengths on the ground. The survey resolution is of order 4 min in the 100 micron bandpass, and 2 min at 60 microns (IRAS Explanatory Supplement, 1988). Information on a scale of 1' is available on some sources from the CPC. Deconvolution and image resolution using this database is one of the subjects of this workshop. Author

High resolution images of the 12 micron and 25 micron IRAS survey data from each HCON crossing the Galactic Plane are being created for those regions that the original IRAS processing labeled as confused. This encompasses the area within 100 deg longitude of the Galactic Center and within 3 deg to 10 deg of the Plane. The procedures used to create the images preserve the spatial resolution inherent in the IRAS instrument. The images are separated into diffuse and point source components and candidate sources are extracted from the point source image after non-linear spatial sharpening. Fluxes are estimated by convolving the candidate sources with the point response function and cross-correlating with the original point source image. A source is considered real if it is seen on at least two HCON's with a rather generous flux match but a stringent position criterion. A number of fields spanning a range of source densities from low to high have been examined. Initial analysis indicates that the imaging and extraction works quite well up to a source density of about 100 sources per square degree or down to roughly 0.8 Janskys. Author

Images produced from the Maximum Correlation Method sometimes suffer from visible striping artifacts, especially for areas of extended sources. Possible causes are different baseline levels and calibration errors in the detectors. We incorporated these factors into the MCM algorithm, and tested the effects of different constraints on the output image. The result shows significant visual improvement over the standard MCM Method. In some areas the new images show intelligible structures that are otherwise corrupted by striping artifacts, and the removal of these artifacts could enhance performance of object classification algorithms. The constraints were also tested on low surface brightness areas, and were found to be effective in reducing the noise level. Author

BEYOND MAXIMUM ENTROPY: FRACTAL PIXON-BASED IMAGE RECONSTRUCTION c82
Richard C. Puetter and R. K. Pina *In* JPL, Science with High Spatial Resolution Far-Infrared Data Apr. 1994 p 61-67 Sponsored by NSF (For primary document see N95-21749 06-88)
Avail: CASI HC A02/MF A02

We have developed a new Bayesian image reconstruction method that has been shown to be superior to the best implementations of other competing methods, including Goodness-of-Fit methods such as Least-Squares fitting and Lucy-Richardson reconstruction, as well as Maximum Entropy (ME) methods such as those embodied in the MEMSYS algorithms. Our new method is based on the concept of the pixon, the fundamental, indivisible unit of picture information. Use of the pixon concept provides an improved image model, resulting in an image prior which is superior to that of standard ME. Our past work has shown how uniform information content pixons can be used to develop a 'Super-ME' method in which entropy is maximized exactly. Recently, however, we have developed a superior pixon basis for the image, the Fractal Pixon Basis (FPB). Unlike the Uniform Pixon Basis (UPB) of our 'Super-ME' method, the FPB basis is selected by employing fractal dimensional concepts to assess the inherent structure in the image. The Fractal Pixon Basis results in the best image reconstructions to date, superior to both UPB and the best ME reconstructions. In this paper, we review the theory of the UPB and FPB pixon and apply our methodology to the reconstruction of far-infrared imaging of the galaxy M51. The results of our reconstruction are compared to published reconstructions of the same data using the Lucy-Richardson algorithm, the Maximum Correlation Method developed at IPAC, and the MEMSYS ME algorithms. The results show that our reconstructed image has a spatial resolution a factor of two better than best previous methods (and a factor of 20 finer than the width of the point response function), and detects sources two orders of magnitude fainter than other methods. INTERACTING GALAXIES RESOLVED BY IRAS c82
Joseph M. Mazzarella and Jason A. Surace *In its* Science with High Spatial Resolution Far-Infrared Data Apr. 1994 p 71-79 (For primary document see N95-21749 06-88)
Avail: CASI HC A02/MF A02

We discuss procedures, limitations and results of high resolution processing of interacting galaxies observed by the Infrared Astronomical Satellite (IRAS). Among 56 potentially resolvable interacting groups selected from the IRAS Bright Galaxy Sample, 22 systems have been resolved yielding fluxes for a total of 51 galaxies. In about 2/3 of the resolved pairs, both galaxies were detected in the far-infrared. A set of isolated non-interacting galaxies was chosen from the Bright Galaxy Sample for comparison with the interacting galaxies. For the current sample, which naturally excludes close pairs and ultraluminous merging systems, the primary conclusions are: (1) It is not possible to distinguish individual interacting galaxies from isolated galaxies of similar luminosity on the basis of infrared properties alone. (2) No direct correlation was found between measures of interaction strength and indicators of enhanced star formation within the resolved systems. (3) Comparison of the interacting and isolated samples indicates statistically significant differences between their distributions of far-infrared color ratios, luminosities, and surface brightnesses. Even during the early stages of interaction spanned by these systems, in a statistical sense, tidal perturbations substantially boost far-infrared indicators of star formation compared to non-interacting systems. We also briefly discuss future prospects for pushing the IRAS data to its limits for additional interacting systems. Author

AZIMUTHALLY AVERAGED RADIAL S(SUB 100 MICRONS)/S(SUB 60 MICRONS) DUST COLOR TEMPERATURES IN SPIRAL GALAXIES c82
Nick A. Devereux *In* JPL, Science with High Spatial Resolution Far-Infrared Data Apr. 1994 p 81-85 (For primary document see N95-21749 06-88)
Avail: CASI HC A01/MF A02

The IRAS S(sub 100 micron)/S(sub 60 micron) dust color temperature profiles are presented for two nearby spiral galaxies M 101 and M 81. The radial dust temperature profiles provided an important constraint on the origin of the far-infrared luminosity. The observed dust temperature is compared with that expected for diffuse interstellar dust heated by the general interstellar radiation field within each galaxy. The implications for the contribution of cirrus to the far-infrared luminosity of M 101 and M 81 are discussed. Author

FAR-INFRARED SOURCES AND DIFFUSE EMISSION IN M31 c82
Cong Xu and George Helou (California Inst. of Tech., Pasadena, CA.) *In* JPL, Science with High Spatial Resolution Far-Infrared Data Apr. 1994 p 87-93 (For primary document see N95-21749 06-88)
Avail: CASI HC A02/MF A02

A study on the far-infrared (FIR) emission of M31 has been carried out with the High Resolution (HiRes) maps (approx. 1 min) derived from IRAS data. Sixty-eight FIR sources are detected in M31, which in general coincide with optical HII regions, and contribute 15, 23, 29, and 23 percent to the fluxes in 12, 25, 60, and 100 micron bands, respectively. The remaining diffuse emission, which dominates the FIR emission of M31, is studied

using a dust heating model which utilizes the UV and optical photometry maps and the HI maps available in the literature. It is found that the global dust-to-gas ratio in M31 disk is 6.5 10(exp -3), very close to the dust-to-gas ratio in the solar neighborhood. There is a significant galactocentric gradient of the dust-to-HI-gas ratio, with an e-folding scale length of 9 kpc. The diffuse dust correlates tightly with the HI gas. The model indicates that the non-ionizing UV (913-4000A) radiation from massive and intermediate massive stars contributes only about 30 percent of the heating of the diffuse dust, while the optical-NIR (4000-9000A) radiation from the old stellar population is responsible for the most of the heating.

CORRELATION OF FAR-INFRARED EMISSION AND RADIO CONTINUUM EMISSION ALONG THE MAJOR AXIS OF EDGE-ON SPIRAL GALAXIES **c82**
Bryant Heikkila and William R. Webber *In* JPL, Science with High Spatial Resolution Far-Infrared Data Apr. 1994 p 95-100 (For primary document see N95-21749 06-88)
Avail: CASI HC A02/MF A02

Using new High Resolution far-infrared (FIR) images we have determined FIR flux densities, the FIR luminosity, and intensity profiles along the major axis for eight nearby edge-on spiral galaxies. We present spatial comparisons between the FIR profiles in three of the four IRAS Bands (25, 60, 100 microns). We also present direct spatial comparisons between the 60 micron intensity profiles and intensity profiles from 20 cm radio continuum maps with identical resolution (approx. 60 sec) obtained from J. J. Condon. Using these profiles we have evaluated the 60 micron-to-20 cm ratio Q(sub 60) along the major axis for each galaxy and have compared the results to global Q(sub 60) values. This analysis reveals that a considerable amount of complicated structure exists within the disk of spiral galaxies. Closer examination of this disk structure will make it possible to place further constraints on the well known global far-infrared and radio continuum emission correlation. Author

FAR-INFRARED MAPPING OF DUSTY ELLIPTICAL GALAXIES **c82**
Joanna F. Lees, D. A. Harper, Michael P. Rupen (National Radio Astronomy Observatory, Socorro, NM.), and G. R. Knapp (Princeton Univ., NJ.) *In* JPL, Science with High Spatial Resolution Far-Infrared Data Apr. 1994 p 101-106 (For primary document see N95-21749 06-88)
(Grant NGR14-001-227)
Avail: CASI HC A02/MF A02

Preliminary results from a program to map the thermal far-infrared emission from cool dust in elliptical galaxies using the Yerkes 60-Channel Camera on the Kuiper Airborne Observatory (KAO) are presented. The 160 micron emission from the elliptical NGC 6542 is apparently extended over the optical galaxy whereas the 100 micron emission is unresolved. This implies a dust temperature gradient consistent with that expected for dust with Galactic properties exposed to the general interstellar radiation field of the elliptical galaxy. Observations of the elliptical NGC 5666 and the NGC 7463/4/5 compact group (consisting of the elliptical NGC 7464, the S0 NGC 7465, and the spiral NGC 7463) are also discussed. Author

EXTENDED FAR-INFRARED EMISSION AND STAR FORMATION IN SEYFERT GALAXIES **c82**
A. P. Marston *In* JPL, Science with High Spatial Resolution Far-Infrared Data Apr. 1994 p 107-113 (For primary document see N95-21749 06-88)
Avail: CASI HC A02/MF A02

An investigation into the extended distribution of far-infrared (FIR) emission associated with nearby Seyfert galaxies is made using a set of MEM reconstructions of IRAS Chopped Photometric Channel (CPC) data (Marston 1993). The data is compared to a set of HII/starburst galaxy images similarly processed in order to compare distributions and FIR color properties. It is shown that the central 1 kpc or so of Seyfert galaxies show extended FIR emission. FIR colors suggest that the bulk of this emission is not directly associated with an active nucleus. They further suggest that the origins of the majority of the emission is from heated dust associated with star formation surrounding the nucleus rather than dust heated by the active nucleus. Nearby Seyfert galaxies are shown to have a higher concentration of far-infrared emission from their centers than the HII/starburst galaxies and a number appear to reside in disk galaxies with relatively low ongoing star formation in their disks. An example of this is NGC 7582 which has a smooth disk but an active nucleus/starbust center.

TWO-DIMENSIONAL MAPS OF THE INFRARED-TO-RADIO RATIO IN SPIRAL GALAXIES **c82**
Kenneth A. Marsh and George Helou *In its* Science with High Spatial Resolution Far-Infrared Data Apr. 1994 p 115-120 (For primary document see N95-21749 06-88)
Avail: CASI HC A02/MF A02

We have produced two-dimensional maps of the intensity ratio Q(sub 60) of 60 micron infrared to 20 cm radio continuum emission, for a set of 25 nearby galaxies, mostly spirals. The ratio maps were obtained from infrared images made using Infrared Astronomical Satellite (IRAS) data with the Maximum Correlation Method, and radio images made using VLA data. Before taking the ratio, the radio images were processed so as to have the same resolution properties as the infrared images; the final spatial resolution in all cases is approximately 1 min, corresponding to 1-2 kpc for most galaxies. These images allow us to study the variations for the Q(sub 60) ratio with unprecedented spatial resolution, and thus represents a major improvement over earlier work. Our new high-resolution maps confirm the slow decrease of Q(sub 60) with increasing radial distance from the nucleus, but show additional structure which is probably associated with separate sites of active star formation in the spiral arms. The maps show Q(sub 60) to be more closely related to infrared surface brightness than to the radial distance in the galaxy disk. We expect that the results will provide improved constraints on the evolution (diffusion, decay and escape) of cosmic-ray electrons in the magnetic field of the disks. Author

THE VARIATION OF THE DUST TEMPERATURE WITHIN LATE-TYPE SPIRAL GALAXIES **c82**
Rhodri H. Evans *In* JP, Science with High Spatial Resolution Far-Infrared Data Apr. 1994 p 121-136 (For primary document see N95-21749 06-88)
Avail: CASI HC A02/MF A02

We use high resolution (HiRes) 60 and 100 micron data to investigate the variation of the dust temperature in a sample of 4 late-type spiral galaxies. We have investigated the radial variation of the azimuthally averaged 60 and 100 micron surface brightness profiles to see how the dust temperature (or, more correctly, the relative strength of the two components) varies as a function of radius within the galaxies. We find strong evidence for a decrease in the dust temperature (or an increase in the relative contribution of the 100 micron flux compared to the 60 micron flux) as a function of radius. We discuss these results in the light of the continuing debate as to whether massive star formation or the general interstellar radiation field is the major heating source of the dust. Author

AN IRAS HIRES STUDY OF LOW MASS STAR FORMATION IN THE TAURUS MOLECULAR RING **c82**
Susan Terebey and Jason A. Surace (Hawaii Univ., Honolulu, HI.) *In its* Science with High Spatial Resolution Far-Infrared Data Apr. 1994 p 127-136 (For primary document see N95-21749 06-88)
Avail: CASI HC A02/MF A02

The Taurus molecular cloud supposedly has no star clusters but only isolated star formation. However, the Infrared Astronomical Satellite (IRAS) shows us that a small star cluster is currently forming in Taurus. Most of the sources are deeply embedded and are probably low-mass protostars. We use High Resolution (HiRes) images of the IRAS data from the Infrared Processing and Analysis Center (IPAC) to look for additional infrared members of the cluster. We also investigate the question of whether the infrared emission matches predictions for protostellar sources by examining whether the dust emission is resolved on scales of one arcminute (approx. 10(exp 17) cm). With the exception of a luminous visible star, HD 29647, we find that the sources L1527, TMC1A, TMC1, TMC1C, tMR1, and IC2087 are unresolved in the HiRes images at 60 microns. Further analysis of IC2087 shows that it is unresolved at all four IRAS wavelengths. Author

(Grants AF-AFOSR-0140-86; AF-AFOSR-0320-89)
Avail: CASI HC A02/MF A02

We present high resolution HIRAS 60 and 100 micron images of AGB stars surrounded by fossil dust shells. Resolving the extended emission of the circumstellar dust allows a determination of the mass loss history of the star. We show that the geometry of the 60 micron emission surrounding HR 3126 agrees well with that of the optical reflection nebula. The emission around the carbon star U Hya is resolved into a central point source and a ring of dust, and the mass loss rate in the detached shell is 70 times higher than the current mass loss rate. WAVELET ANALYSIS APPLIED TO THE IRAS CIRRUS c82
William D. Langer, Robert W. Wilson (Bell Telephone Labs., Inc., Holmdel, NJ.), and Charles H. Anderson (Washington Univ., Saint Louis, MO.) *In its* Science with High Spatial Resolution Far-Infrared Data Apr. 1994 p 143-155 (For primary document see N95-21749 06-88)
Avail: CASI HC A03/MF A02

The structure of infrared cirrus clouds is analyzed with Laplacian pyramid transforms, a form of non-orthogonal wavelets. Pyramid and wavelet transforms provide a means to decompose images into their spatial frequency components such that all spatial scales are treated in an equivalent manner. The multiscale transform analysis is applied to IRAS 100 micrometer maps of cirrus emission in the north Galactic pole region to extract features on different scales. In the maps we identify filaments, fragments and clumps by separating all connected regions. These structures are analyzed with respect to their Hausdorff dimension for evidence of the scaling relationships in the cirrus clouds. Author

A HIRES ANALYSIS OF THE FIR EMISSION OF SUPERNOVA REMNANTS c82
Zhong Wang *In its* Science with High Spatial Resolution Far-Infrared Data Apr. 1994 p 157-163 (For primary document see N95-21749 06-88)
Avail: CASI HC A02/MF A02

The high resolution (HiRes) algorithm has been used to analyze the far infrared emission of shocked gas and dust in supernova remnants. In the case of supernova remnant IC 443, we find a very good match between the resolved features in the deconvolved images and the emissions of shocked gas mapped in other wavelengths (lines of H2, CO, HCO+, and HI). Dust emission is also found to be surrounding hot bubbles of supernova remnants which are seen in soft X-ray maps. Optical spectroscopy on the emission of the shocked gas suggests a close correlation between the FIR color and local shock speed, which is a strong function of the ambient (preshock) gas density. These provide a potentially effective way to identify regions of strong shock interaction, and thus facilitate studies of kinematics and energetics in the interstellar medium. Author

APPLICATION OF MCM IMAGE CONSTRUCTION TO IRAS COMET OBSERVATIONS c82
Martin F. Schlapfer and Russell G. Walker *In* JPL, Science with High Spatial Resolution Far-Infrared Data Apr. 1994 p 173-176 (For primary document see N95-21749 06-88)
Avail: CASI HC A01/MF A02

There is a wealth of IRAS comet data, obtained in both the survey and pointed observations modes. However, these measurements have remained largely untouched due to difficulties in removing instrumental effects from the data. We have developed a version of the Maximum Correlation Method for Image Construction algorithm (MCM) which operates in the moving coordinate system of the comet and properly treats both real cometary motion and apparent motion due to spacecraft parallax. This algorithm has been implemented on a 486/33 PC in FORTRAN and IDL codes. Preprocessing of the IRAS CRDD includes baseline removal, deglitching, and removal of long tails due to dielectric time constants of the detectors. The resulting images are virtually free from instrumental effects and have the highest possible spatial resolution consistent with the data sampling. We present examples of high resolution IRAS images constructed from survey observations of Comets P/Tempel 1 and P/Tempel 2, and pointed observations of IRAS-Araki-Alcock. Author

LUMINOUS RADIO-QUIET SOURCES IN THE W3(MAIN) CLOUD CORE c82
C. Gareth WynnWilliams, E. F. Ladd, James R. Deane, and D. B. Sanders *In* JPL, Science with High Spatial Resolution Far-Infrared Data Apr. 1994 p 177-181 (For primary document see N95-21749 06-88)
(Grant NSF AST-89-19563)
Avail: CASI HC A01/MF A02

We have resolved 450 micrometer and 800 micrometer emission from the W3(Main) star forming region into three major peaks, using 8 inch - 14 inch beams with the James Clerk Maxwell Telescope on the summit of Mauna Kea. One of the submillimeter sources is identified with W3 - IRS5, a well-known candidate protostar. However, to our surprise, we find that none of the submillimeter peaks coincides with any of the prominent compact HII regions in the area. We estimate that the three submillimeter sources together contribute 30-50 percent of the total bolometric luminosity of the region, and speculate that the contribution of luminous radio-quiet sources to the total luminosity of HII region/molecular cloud complexes may be larger than is often assumed. Radioastron project, initiated in 1985, is an international collaborative mission to launch a space research satellite carrying a 10 meter radio telescope to an elliptical orbit around the Earth. The telescope comprises four two-channel VLBI (very long baseline interferometry) receivers at different frequencies built by project participants. The Radio Laboratory of HUT is responsible for the cooled 22 GHz receiver. Thermal, mechanical, engineering and two flight models have been manufactured in co-operation between the Radio Laboratory, Ylinen Electronics, Co. and the Applied Electronics Laboratory of HUT. The engineering model has been exposed to a full space qualification test program. The flight models were delivered in December 1993 and the other models earlier. The most important receiver design objectives have been low noise, good phase stability and high reliability. A noise temperature of better than 100 K and a phase stability of better than 3 deg were measured. This report presents the space qualification tests of the receiver. NTIS

EXPERIMENTAL HYPERVELOCITY IMPACT EFFECTS ON SIMULATED PLANETESIMAL MATERIALS

William J. Tedeschi, James F. Schulze, John L. Remo (Quantametrics, Inc., Saint James, NY.), and Raymond P. Young, Jr. (Calspan Field Services, Inc., Arnold AFS, TN.) 1994 28 p Presented at the 1994 Hypervelocity Impact Symposium, Santa Fe, NM, 16-20 Oct. 1994

(Contract DE-AC04-94AL-85000)

(DE94-017290; SAND-93-3901C; CONF-9410131-5) Avail: CASI HC A03/MF A01

Experimental results are presented from a series of hypervelocity impact tests on simulated comet and asteroid materials for the purpose of characterizing their response to hypervelocity kinetic energy impacts. Nine tests were conducted at the Air Force Arnold Engineering Development Center (AEDC) S1 Range Facility on ice, rock, and iron target samples using a spherical 2.39 mm diameter aluminum impactor (0.0192 gm) at impact velocities of from 7.6 to 8.4 km/sec. The test objectives were to collect target response phenomenology data on cratering, momentum deposition and enhancement, target fragmentation, and material response under hypervelocity impact loading conditions. A carefully designed ballistic pendulum was used to measure momentum deposition into the targets. Observations and measurements of the impacted samples provide important insights into the response of these materials to kinetic energy impacts, especially in regards to unexpectedly large measured values of momentum enhancement to some of the targets. Such information is required to allow us to successfully deflect or fragment comets or asteroids which might someday be detected on collision trajectories with Earth. DOE

PREDICTIONS FROM QUANTUM COSMOLOGY

A. Vilenkin May 1994 12 p

(PB95-111126; IHES/P/94/35) Avail: CASI HC A03/MF A01

The world view suggested by quantum cosmology is that eternally inflating universes with all possible values of the fundamental constants are spontaneously created out of nothing. The author explores the consequences of the assumption that we are a 'typical' civilization living in this metauniverse. The conclusions include inflation with an extremely flat potential and low thermalization temperature, structure formation by topological defects, and an appreciable cosmological constant. NTIS

(DE95-002329; LBL-35929; CONF-9407143-1) Avail: CASI HC A01/MF A01

This paper deals with an investigation of the properties of hypothetical strange-matter stars, which are composed of u, d, s quark matter whose energy per baryon number lies below the one of Fe-56 (Witten's strange matter hypothesis). Observable quantities which allow to distinguish such objects from their 'conventional' counterparts, neutron stars and white dwarfs, are pointed out. DOE

COSMOLOGICAL STRING SOLUTIONS BY DIMENSIONAL REDUCTION

K. Behrndt and S. Foerste (Hebrew Univ., Jerusalem, Israel.) Dec. 1993 9 p Presented at the 27th International Symposium Ahrenshoop on the Theory of Elementary Particles, Wendisch-Rietz, Germany, 7-11 Sep. 1993 Sponsored by DAAD, and MINERA

(Contract DE-AC03-76SF-00515)

(DE95-002858; SU-SLAC-PUB-6411; CONF-9309429-1) Avail: CASI HC A02/MF A01

We obtain cosmological four dimensional solutions of the low energy effective string theory by reducing a five dimensional black hole, and black hole-de Sitter solution of the Einstein gravity down to four dimensions. The appearance of a cosmological constant in the five dimensional Einstein-Hilbert produces a special dilaton potential in the four dimensional effective string action. Cosmological scenarios implement by our solutions are discussed. DOE

NEO-LISP: DEFLECTING NEAR-EARTH OBJECTS USING HIGH AVERAGE POWER, REPETITIVELY PULSED LASERS

C. R. Phipps and M. M. Michaelis (Natal Univ., Durban, South Africa.) 1994 35 p Presented at the ECLIM 23: Laser Interaction With Matter, Oxford, England, 19-23 Sep. 1994

(Contract W-7405-eng-36)

(DE95-000863; LA-UR-94-3124; CONF-9409226-1) Avail: CASI HC A03/MF A01

Several kinds of Near-Earth objects exist for which one would like to cause modest orbit perturbations, but which are inaccessible to normal means of interception because of their number, distance or the lack of early warning. For these objects, LISP (Laser Impulse Space Propulsion) is an appropriate technique for rapidly applying the required mechanical impulse from a ground-based station. In order of increasing laser energy required, examples are: (1) repositioning specially prepared geosynchronous satellites for an enhanced lifetime; (2) causing selected items of space junk to re-enter and burn up in the atmosphere on a computed trajectory; and (3) safely deflecting Earth-directed comet nuclei and earth-crossing asteroids (ECA's) a few tens of meters in size (the most hazardous size). They will discuss each of these problems in turn and show that each application is best matched by its own matrix of LISP laser pulse width, pulse repetition rate, wavelength and average power. The latter ranges from 100W to 3GW for the cases considered. They will also discuss means of achieving the active beam phase error correction during passage through the atmosphere and very large exit pupil in the optical system which are required in each of these cases. RELATIVISTIC BINARY NEUTRON STAR COALESCENCE
J. R. Wilson and G. J. Mathews 1994 6 p Presented at the 7th Marcel Grossman Meeting on General Relativity, Stanford, CA, 24-29 Jul. 1994
(Contract W-7405-eng-48)
(DE94-019311; UCRL-JC-118330; CONF-9407129-1) Avail: CASI HC A02/MF A01

The authors report on the first results from a (3+1) dimensional general relativistic hydrodynamics code to describe the evolution of a neutron-star binary system. The relativistic field equations are exactly solved at each time slice with a constrain that spatial 3-metric remains conformally flat. The effect of gravitational radiation is introduced by the quadrupole radiation reaction formula. The gravitational radiation signal is also estimated by the quadrupole formula. An illustrative calculation of an orbiting binary is presented. DOE

PHYSICS OF SYSTEMS CONTAINING NEUTRON STARS Progress Report, 1 Jan. - 31 Dec. 1994
Jacob Shaham Jan. 1995 15 p
(Grant NAGw-1618)
(NASA-CR-197304; NAS 1.26:197304; CAL-2261) Avail: CASI HC A03/MF A01

This grant deals with several topics related to the dynamics of systems containing a compact object. Most of our research in 1994 dealt with systems containing Neutron Stars (NS's), but we also addressed systems containing a Black Hole (BH) or a White Dwarf (WD) in situations relevant to NS systems. Among the systems were isolated regular pulsars, Millisecond Pulsars (MSP's) that are either Single (SMP's) or in a binary (BMP's) Low Mass X-Ray Binaries (LMX's) and Cataclysmic Variables (CV's). We also dealt with one aspect of NS structure, namely NS superfluidity. A large fraction of our research dealt with irradiation-driven winds from companions. These winds turned out to be of some importance in the evolution of LMXB's and MSP's, be they SMP's or BMP's. While their role during LMXB evolution (i.e. during the accretion phase) is not yet clear, they may play an important role in turning BMP's into SMP's and also in bringing about the formation of planets around MSP's. AN EXPERIMENTAL DETERMINATION OF METEOR DAILY ARRIVAL RATE VARIATION Interim Report
John M. Quinn 2 Dec. 1993 24 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A279484; AD-E201960; PL-TR-93-2247; ERP-1135) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This report addresses the day to day variability in the meteor arrival rate over a two-month period on the PL/GP High Latitude Meteor Scatter Test Bed and the PL Mid Latitude Meteor Scatter Test bed. In particular, we present evidence that the meteor arrival variability fits an exponential distribution, thus the duration of the system testing period to estimate the meteor arrival variability can be calculated. The arrival rate data from two different sites show that the day-to-day percent change in the arrival rate, at least in the short term, can be modeled as an exponential distribution with a mean of near 10 percent. This suggests meteor scatter communication testing to evaluate performance should be conducted for 9 to 12 days as a minimum to approximate medium term, 30 to 90 days, day-to-day arrival variation. OBSERVATIONS OF COLD MAGNETOSPHERIC IONS AT GEOSYNCHRONOUS ORBIT DURING TIMES OF HIGH ACTIVITY
R. C. Elphic, L. A. Weiss, M. F. Thomsen, D. J. McComas, and S. J. Bame 1994 4 p Presented at the 8th International Symposium on Solar Terrestrial Physics, Sendai, Japan, 6-10 Jun. 1994
(Contract W-7405-eng-36)
(DE95-000936; LA-UR-94-3223; CONF-9406192-4) Avail: CASI HC A01/MF A01

Flowing, cold magnetospheric ions have been observed in conjunction with geosynchronous orbit magnetopause crossings since the earliest ATS and OGO missions. The authors have reported on the occurrence and convection of low-energy (10-100 eV) ions seen by multiple satellites in association with geosynchronous orbit magnetopause and low-latitude boundary layer (LLBL) encounters. More generally, Los Alamos 3-D plasma instruments observe these ions following storm sudden commencements (SSC's), when activity levels are high. The ions appear to be convecting radially outward and usually westward at speeds of a few to several tens of kilometers per second. Often the energy spectra reveal peaks at energies appropriate for cold convecting H(+), He(+) and O(+). The occurrence frequency distribution of these dense cold ions is peaked near 1400 LT, with an overall range from 1000 to beyond 1800 LT. This local time distribution is greatly skewed from the overall plasmaspheric distribution, which peaks closer to 1800 LT. Multisatellite observations show that the ions are seen first at late afternoon local times and then at progressively earlier and earlier local times (though usually no earlier than 1000 LT). This apparent evolution in local time suggests that the late-afternoon plasmaspheric plasma moves out and downward during times of increased magnetospheric activity. The three-satellite observations also allow the authors to track cold plasma convection at multiple points in the magnetosphere, and potentially provide a glimpse of the large-scale convection pattern. DISTRIBUTION OF LIGHT ELEMENT ISOTOPES IN BENCUBBIN AND WEATHERFORD METEORITES: AN INDICATOR OF HETEROGENEITY IN THE PRIMITIVE SOLAR NEBULA Technical Report, 1 Oct. 1988 - 30 Sep. 1989
J. Blacic, C. Maggiore, J. Taylor, H. Newsom, and K. Marti 1994 4 p
(Contract W-7405-eng-36)
(DE94-019167; LA-SUB-94-125) Avail: CASI HC A01/MF A01

The objective is to study light element isotopes, particularly N-15, in meteorites to elucidate early solar nebula processes. The approach is to use microion beams to induce characteristic nuclear reactions in specific minerals in the meteorites, and to develop isotope imaging techniques by beam rastering. Early results demonstrate the feasibility of the beam rastering technique and we have successfully measured a delta N-15 ratio of about -50 (per thousand) in sinoite (Si2N2O) in an enstatite chondrite. No conclusions can be drawn at this stage of the investigation. Ultimately, the results are important to understanding conditions during planetary formation, and in developing new analytic techniques applicable to a wide range of geophysical problems. DOE

STUDIES OF THE GAS TORI OF TITAN AND TRITON Annual Report, 24 Jan. 1994 - 23 Jan. 1995
William H. Smyth Jan. 1995 13 p
(Contract NASw-4832)
(NASA-CR-197377; P-498; NAS 1.26:197377) Avail: CASI HC A03/MF A01

Progress in the development of the model for the circumplanetary distribution of atomic hydrogen in the Saturn system produced by a Titan source is discussed. Because of the action of the solar radiation acceleration and the obliquity of Saturn, the hydrogen distribution is shown to undergo seasonal changes as the planet moves about the Sun. Preliminary model calculations show that for a continuous Titan source, the H distribution is highly asymmetric about the planet and has a density maximum near the dusk side of Saturn, qualitatively similar to the pattern recently deduced by Shemansky and Hall from observations acquired by the UVS instruments aboard the Voyager spacecrafts. The investigation of these Voyager data will be undertaken in the next project year. Author

SIMULATED RAREFIED ENTRY OF THE GALILEO PROBE INTO THE ATMOSPHERE OF JUPITER
Brian L. Hass (Eloret Corp., Palo Alto, CA.) and Frank S. Milos [1993] 8 p
(Contract NCC2-582)
(NASA-TM-110507; NAS 1.15:110507) Avail: CASI HC A02/MF A01

Flow properties and aerodynamics are computed with a direct simulation Monte Carlo (DSMC) method for rarefied entry of the Galileo Probe into the atmosphere of Jupiter. Accurate predictions of vehicle drag coefficients are needed in order to assess atmospheric properties from the onboard Atmosphere Structure Experiment where highly-sensitive accelerometers will measure the drag force to within 10-6 barr during the initial entry phase at high altitudes. The corresponding flow rarefraction extends from the free molecule limit to the near continuum transition regime (Re less than 1000). Simulation results indicate that C(sub D) varies from 2.1 at the free molecule limit down to 1.6 at Re(infinity) = 1,000. Temperatures, densities, and internal energies throughout the flow field were also computed at each altitude ranging from 735 km to 353 km above the 1 barr level in the Jovian atmosphere. Surface heating and temperatures of the probe were computed directly in the DSMC code by assuming radiative equilibrium. Material response was re-asssessed accurately during entry by accounting for conductivity, heat capacity, and pyrolysis which led to surface material mass efflux several times that of the freestream mass influx. The simulation also accounted for the quantum nature of the rotational energy mode of the dominant atmospheric species H2 through partial internal excitation in the freestream gas. Author

MODELING OF COLLISION INDUCED ABSORPTION SPECTRA OF CO2-CO2 PAIRS FOR PLANETARY ATMOSPHERE OF VENUS Yearly Progress Report, 1 Apr. 1994 - 31 Mar. 1995
Aleksandra Borysow 31 Mar. 1995 4 p
(Grant NAGw-2974)
(NASA-CR-197373; NAS 1.26:197373) Avail: CASI HC A01/MF A01

The objective of the proposal was to model the rototranslational and rotovibrational collision induced absorption spectral bands of importance for the radiative transfer analysis of the atmosphere of Venus. Our main task has involved CO2 pairs. The approach is not straightforward: whereas computational techniques to compute CIA spectra of small linear molecules exist, and were successfully applied to molecules like H2 or N2, they fail when applied to large molecules like CO2. For small molecules one can safely assume that the interaction potential is isotropic. The same approximation does not work for CO2, and when employed, it gives an incorrect band shape and only 50 percent of the CIA intensity. Derived from text

THE DOUBLE EAGLE SPACE EXPERIMENT (DESE) BEAMLINE DESIGN
A. M. M. Todd, D. Berwald, and D. L. Bruhwiler 1994 5 p Presented at the 17th International LINAC Conference, Tsukuba, Japan, 21-26 Aug. 1994
(Contract W-7405-eng-36)
(DE94-018319; LA-UR-94-2890; CONF-9408125-26) Avail: CASI HC A01/MF A01

The beamline design for the Double Eagle Space Experiment (DESE) is described. DESE seeks to map the lunar surface material composition using an active particle beam probe. The 425 MHz, 11.8 m straight beamline delivers a 13 mA, 5.11 MeV neutral hydrogen beam with an equivalent rms divergence of (approximately)40 micro rad. The authors studied the beam propagation through the output optics components to the lunar surface and find an adequate return signal for the DESE mapping mission. DOE

NEUTRINO MAGNETIC MOMENTS AND THE SOLAR NEUTRINO PROBLEM
E. Kh. Akhmedov 1994 10 p
(Contract DE-FG06-90ER-40561)
(DE94-017579; DOE/ER-40561/153) Avail: CASI HC A02/MF A01

Present status of the neutrino magnetic moment solutions of the solar neutrino problem is reviewed. In particular, we discuss a possibility of reconciling different degrees of suppression and time variation of the signal (or lack of such a variation) observed in different solar neutrino experiments. It is shown that the resonant spin-flavor precession of neutrinos due to the interaction of their transitions magnetic moments with solar magnetic field can account for all the available solar neutrino data. For not too small neutrino mixing angles (sin 2(theta))(sub o) is approximately greater than 0.2, the combined effect of the resonant spin-flavor precession and neutrino oscillations can result in an observable flux of solar (bar (nu))(sub e)'s. CORONAGRAPHIC OBSERVATIONS AND ANALYSES OF THE ULTRAVIOLET SOLAR CORONA Semiannual Status Report Nos. 21, 22, 23, and 24, 1 Oct. 1992 - 30 Sep. 1994
John L. Kohl 30 Sep. 1994 14 p
(Grant NAG5-613)
(NASA-CR-197370; NAS 1.26:197370) Avail: CASI HC A03/MF A01

This status report for the period 1 October 1992 to 30 September 1994 covers the final preparation and first observations with the Spartan Ultraviolet Coronal Spectrometer on Spartan 201-1, and the preparation and second flight for Spartan 201-2. Both flights were fully successful and resulted in high quality spectroscopic observations of the extended solar corona out to 3.5 solar radii from Sun-center. The primary focus of this report is the results from Spartan 201-1. There is also a brief description of the evaluation of the quick look data from the second flight. Highlights from the first flight include a discovery that the proton velocity distribution in coronal holes is complex and consists of a central core with elevated high velocity wings compared to a Gaussian shape. SOLAR FLARE MDH Annual Report, 1 Jan. - 31 Dec. 1993
H. Strauss and E. Hameiri 31 Dec. 1993 9 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0044-91; AF Proj. 2311)
(AD-A279894; AFOSR-94-0315TR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

During the past year, several topics were studied which are important for solar MHD. These include: (1) 3D coalescence instability and magnetic reconnection. Magnetic reconnection is fairly well understood in two dimensional theory and numerical simulations in which there is an ignorable coordinate. It is poorly understood in three dimensional line tied magnetic fields, which are the generic case in solar flux loops. The 3D line tied coalescence MHD instability was investigated both analytically and numerically. In the nonlinear stages of the simulation, the instability drives magnetic reconnection. As in earlier 3D forced reconnection simulations, an intense current layer forms where magnetic energy is converted to heat. It was found that while line tying somewhat inhibits reconnection, it does not prevent it; (2) Line tied gravitational ballooning instability. A new two dimensional prominence model was found and its stability was analyzed. This instability might describe the irregular rain falling from prominences. Boundary conditions for the solar corona. It has been the practice to model the effects of the chromosphere and photosphere only through their influence on the boundary conditions imposed at the base of the corona. DTIC

THE SOLAR NEUTRINO PROBLEM: NEITHER ASTROPHYSICS NOR OSCILLATIONS?
Alexei Yu. Smirnov (Academy of Sciences, USSR, Moscow, USSR.) 1994 22 p Presented at the International Workshop on Solar Neutrino Problem: Astrophysics or Oscillations, GranSasso, Italy, 28 Feb. - 1 Mar. 1994 Prepared in cooperation with International Centre for Theoretical Physics, Trieste, Italy
(Contract DE-FG06-90ER-40561)
(DE94-012850; DOE/ER-40561/136) Avail: CASI HC A03/MF A01

There is no consistent solar model which can describe all experimental data on the solar neutrinos. The problem can be formulated essentially in a model independent way. The key points are the comparison of the Homestake and the Kamiokande data as well as the comparison of the GALLEX and SAGE results with minimal signal estimated from the solar luminosity. It is argued that in such a comparison one should use the Homestake-II data (only after 1986) with caution. The results of the model independent analysis show strong suppression of the beryllium neutrino flux. The data can be well described by the resonant flavor conversion. For the 'low flux model' which can accommodate the Kamiokande signal, a consistent solution can be found for the neutrino mass squared difference Delta sq m = (0.3 - 1.0) (center dot) 10(exp -5) sq eV and values of mixing angle sin(exp 2) 2(theta) approaches 5 (center dot) 10(exp -5) sq eV and values of mixing angle sin(exp 2) 2(theta) ('very small mixing solution'). CORONAL MASS EJECTIONS IN THE SOLAR WIND AT HIGH SOLAR LATITUDES: AN OVERVIEW
J. T. Gosling 1994 22 p Presented at the 3rd SOHO Workshop: Solar Dynamic Phenomena and Solar Wind Consequences, Estes Park, CO, Sep. 1994
(Contract W-7405-eng-36)
(DE95-000844; LA-UR-94-3265; CONF-9409232-1) Avail: CASI HC A03/MF A01

Ulysses has provided the first direct measurements of coronal mass ejections, CMES, in the solar wind at high heliographic latitudes. This paper provides an overview of new and unexpected results from the plasma experiment on Ulysses, supplemented with magnetic field measurements, during the spacecraft's first excursion to high solar latitudes. A striking aspect of the high-latitude CME's observed is that they all had high speeds, with the overall average speed being 730 km/s. A new class of forward-reverse shock pairs, associated with expansion of CME's, has been discovered at high latitudes. Of six certain CME's observed at high latitudes, three have associated shock pairs of this nature. Combined Ulysses and Yohkoh observations suggest that the flux rope topology characteristic of some CME's results from reconnection within the legs of neighboring magnetic loops embedded within the escaping CME's. ABSOLUTE, EXTREME-ULTRAVIOLET SOLAR SPECTRAL IRRADIANCE MONITOR (AESSIM) Final Technical Report, 15 Nov. 1989 - 14 Nov. 1993
W. H. Parkinson and Peter L. Smith Apr. 1994 24 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0063-90)
(AD-A279345; AFOSR-94-0293TR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The goal of this research program was development of a method for obtaining daily radiometrically accurately, solar spectral irradiance data at EUV wavelengths. In orbit radiometric instrumentation recalibration is a fundamental requirement for accurate spectral flux measurements. We have studied a low-pressure version of the EUV radiance standard and concluded that a substantial redesign of it would be required if a suitable one is to be developed for in orbit calibration of a solar spectral irradiance monitor. We have reviewed the use, suitability, and the availability of thin film filters for in orbit EUV calibration. In our opinion, the availability of space qualified filters has not been verified. We have evaluated and chosen a design of a 4-spectrograph, flat-field package that provides 0.1 to 0.2 nm resolution in the range 5-175 nm with a total weight including detectors of 1.6 Kg.

Several mission concepts, which involve rocket-borne, calibrated spectrometer underflights to recalibrate the Voyager spacecraft have been considered. DTIC

TESTING THE PRINCIPLE OF EQUIVALENCE BY SOLAR NEUTRINOS
Hisakazu Minakata (Tokyo Metropolitan Univ., Japan.) and Hiroshi Nunokawa (National Lab. for High Energy Physics, Tsukuba, Japan.) Apr. 1994 15 p
(Contract DE-FG06-90ER-40561)
(DE94-014972; DOE/ER-40561/145) Avail: CASI HC A03/MF A01

We discuss the possibility of testing the principle of equivalence with solar neutrinos. If there exists a violation of the equivalence principle, quarks and leptons with different flavors may not universally couple with gravity. The method we discuss employs a quantum mechanical phenomenon of neutrino oscillation to probe into the non-university of the gravitational couplings of neutrinos. We develop an appropriate formalism to deal with neutrino propagation under the weak gravitational fields of the sun in the presence of the flavor mixing. We point out that solar neutrino observation by the next generation water Cherenkov detectors can improve the existing bound on violation of the equivalence principle by 3-4 orders of magnitude if the nonadiabatic Mikheyev-Smirnov-Wolfenstein mechanism is the solution to the solar neutrino problem. THE SOLAR FLUX OF THERMAL NEUTRINOS AND ANTINEUTRINOS OF ALL FLAVORS
Wei Lin (Massachusetts Inst. of Tech., Cambridge, MA.) and W. C. Haxton (Washington Univ., Seattle, WA.) 1994 17 p Presented at the Workshop on Solar Neutrinos and Neutrino Astrophysics, Seattle, WA, Mar. 1994
(Contracts DE-FG06-90ER-40561; DE-AC02-76ER-03069; DE-FC02-94ER-40818)
(DE95-003204; DOE/ER-40561/165; CONF-9403179-1) Avail: CASI HC A03/MF A01

The authors have calculated the flux of neutrinos and antineutrinos of all flavors from various thermal processes occurring in the solar core. They find that the transition of electrons from free states to atomic bound states accompanied by Z(sup 0) emission, is the dominant mechanism of neutrino pair emission in the keV range. Other processes they investigate include Compton production, plasmon decay, and pair emission from thermally populated nuclear states. Their results add to the terrestrial neutrino spectrum for each flavor a prominent peak at about 1 keV, with a flux density comparable to that of the pp electron neutrino peak. These thermal neutrinos carry important information on the solar core temperature and chemical composition and on heavy-flavor neutrino masses. The authors discuss resonant absorption of electron antineutrinos as a possible detection method. DOE

SOLAR WIND COMPOSITION Progress Report
K. W. Ogilvie and M. A. Coplan (Maryland Univ., College Park, MD.) Jan. 1995 32 p
(Grant NAG5-1129)
(NASA-TM-197364; NAS 1.15:197364) Avail: CASI HC A03/MF A01

Advances in instrumentation have resulted in the determination of the average abundances of He, C, N, O, Ne, Mg, Si, S, and Fe in the solar wind to approximately 10%. Comparisons with solar energetic particle (SEP) abundances and galactic cosmic ray abundances have revealed many similarities, especially when compared with solar photospheric abundances. It is now well established that fractionation in the corona results in an overabundance (with respect to the photosphere) of elements with first ionization potentials less than 10 eV. These observations have in turn led to the development of fractionation models that are reasonably successful in reproducing the first ionization (FIP) effect. Under some circumstances it has been possible to relate solar wind observations to particular source regions in the corona. The magnetic topologies of the source regions appear to have a strong influence on the fractionation of elements. Comparisons with spectroscopic data are particularly useful in classifying the different topologies. Ions produced from interstellar neutral atoms are also found in the solar wind. These ions are picked up by the solar wind after ionization by solar radiation or charge exchange and can be identified by their velocity in the solar wind. The pick-up ions provide most of the pressure in the interplanetary medium at large distances. Interstellar abundances can be derived from the observed fluxes of solar wind pick-up ions. Author

NEUTRINO-NEUTRINO SCATTERING AND MATTER-ENHANCED NEUTRINO FLAVOR TRANSFORMATION IN SUPERNOVAE
Yong-Zhong Qian and G. M. Fuller (California Univ., San Diego, CA.) 1994 47 p
(Contract DE-FG06-90ER-40561)
(DE94-017577; DOE/ER-40561/150) Avail: CASI HC A03/MF A01

The authors examine matter-enhanced neutrino flavor transformation (nu(sub tau(mu)) reversible transformation nu(sub e)) in the region above the neutrino sphere in Type 2 supernovae. Their treatment explicitly includes contributions to the neutrino-propagation Hamiltonian from neutrino-neutrino forward scattering. A proper inclusion of these contributions shows that they have a completely negligible effect on the range of nu(sub e)-nu(sub tau(mu)) vacuum mass-squared difference, delta m(exp 2), and vacuum mixing angle, theta, or equivalently sin(exp 2) 2 theta, required for enhanced supernova shock reheating. When neutrino background effects are included, the authors find that r-process nucleosynthesis from neutrino-heated supernova ejecta remains a sensitive probe of the mixing between a light nu(sub e) and a nu(sub tau(mu)) with a cosmologically significant mass. Neutrino-neutrino scattering contributions are found to have a generally small effect on the (delta m(exp 2), sin(exp 2) 2 theta) parameter region probed by r-process nucleosynthesis. They point out that the nonlinear effects of the neutrino background extend the range of sensitivity of reprocess nucleosynthesis to smaller values of delta m(exp 2). DOE

HAS A STANDARD MODEL SOLUTION TO THE SOLAR NEUTRINO PROBLEM BEEN FOUND?
J. N. Bahcall (Institute for Advanced Study, Princeton, NJ.) and C. A. Barnes (California Inst. of Tech., Pasadena, CA.) 1994 5 p
(Contract DE-FG06-90ER-40561)
(DE94-017580; DOE/ER-40561/154) Avail: CASI HC A01/MF A01

The claim by Dar and Shaviv that they have found a standard model solution to the solar neutrino problem is based upon an incorrect assumption made in extrapolating nuclear cross sections and the selective use of a small fraction of the nuclear physics and of the neutrino data. In addition, five different solar model codes show that the rate obtained for the chlorine experiment using the Dar- Shaviv stated parameters differs by a least 14(sigma) from the observed rate. DOE

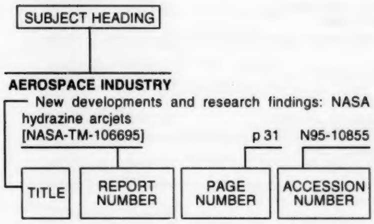
SUBJECT INDEX

Typical Subject Index Listing



The subject heading is a key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension is added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The page number helps you locate the citation in the abstract section. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus.*

ACCELEROMETERS
A method to determine the kinematics of the lower limbs of a subject pedaling a bicycle using encoders and accelerometers
[NASA-CR-197401] p 1453 N95-21866

ACCEPTABILITY
The Advanced Avionics Subsystem Technology Demonstration Program p 1209 N95-20636
Military standard: Test requirements for launch, upper-stage, and space vehicles
[AD-A286627] p 1218 N95-20770

ACCESS TIME
Experimental evaluation of dynamic data allocation strategies in a distributed database with changing workloads
[NASA-CR-195024] p 1456 N95-22431

ACCUMULATIONS
Search for D(+) yields (pi)(+)(mu)(+)(mu)(-)
[DE94-015538] p 1512 N95-20475
A Cost and Performance System (CAPS) in a Federal agency p 1584 N95-20746
Measurement of the B meson differential cross-sections in p(bar p) collisions at (radical)s = 1.8 TeV using the exclusive decays B(sup (+-)) (yields) J/(psi)K(sup (+-)) and B(sup 0) (yields) J/(psi)K*(sup 0)
[DE94-018993] p 1523 N95-21562

ACCUMULATORS
ICE BABY: Measurements of concentration fluctuations in a forest area in winter conditions
[PB95-133468] p 1405 N95-21274
Solar collector manufacturing activity 1993
[DE94-017340] p 1398 N95-22429

ACCURACY
Error analysis in wind turbine field testing
[DE94-011864] p 1391 N95-20260
Impact of propagation mechanisms on global navigation satellite system performance p 1298 N95-20950
An in-line ultrasonic viscometer
[DE95-002982] p 1366 N95-21453
Learning maneuvers using neural network models
[AD-A286470] p 1486 N95-22267

ACETIC ACID
Bioconversion of coal derived synthesis gas to liquid fuels
[DE94-018849] p 1314 N95-20339
A direct process for preparing semi-crystalline polyimides
[NASA-CASE-LAR-15020-1] p 1268 N95-20407

ACETONE
Effect of external stress on the transport of fluids in thermoplastic resin systems
[AD-A279993] p 1270 N95-20596

ACETYLENE
Ceramics formed by pyrolysis of either linear or thermosetting carborane (siloxane or silane) acetylene based precursor polymers
[AD-D016563] p 1266 N95-20291
The synthesis and characterization of new mesogenic diacetylene monomers and their polymers
[AD-A286188] p 1267 N95-20328
Conducting thermoset polymers
[AD-A286541] p 1273 N95-21014

ACID RAIN
Assessment of the atmospheric hazards and risks of new chemicals: Procedures to estimate hazard potentials
[PB95-107488] p 1410 N95-22186
ACIDITY
Effects of meteorology on concentrations of acid aerosols
[PB94-209749] p 1400 N95-19965
An investigation of the applicability of the new ion exchange resin, Reillex(TM)-HPQ, in ATW separations
[DE94-016576] p 1274 N95-21234
Acid-site characterization of water-oxidized alumina films by near-edge x-ray absorption and soft x-ray photoemission
[DE95-003355] p 1247 N95-22234
ACOUSTIC ATTENUATION
Polyurethane-epoxy interpenetrating polymer network acoustic damping material
[AD-D016567] p 1266 N95-20293
Polyurethane-acrylic interpenetrating polymer network acoustic damping material
[AD-D016572] p 1266 N95-20294
Higher order crossings
[AD-A279597] p 1504 N95-20300
Cascade orificial resistive device
[AD-D016529] p 1504 N95-20724
Determination of multiple sound sources
[AD-A286563] p 1504 N95-20823
Small antennas for communication over sea ice
[AD-D016206] p 1301 N95-21156
Effect of atmospheric pressure on measured aircraft noise levels
[PB95-130423] p 1207 N95-21425
ACOUSTIC DUCTS
Robust fixed-structure control
[AD-A286515] p 1485 N95-22216
ACOUSTIC EMISSION
Wavelet-based acoustic recognition of aircraft
[DE94-017701] p 1503 N95-20019
Acoustic emission: The first half century
[DE94-017176] p 1503 N95-20267
Experimental and theoretical evaluation of elastic waves in curved layered media
[AD-A286578] p 1504 N95-20918
ACOUSTIC FREQUENCIES
Microscopic theory of normal liquid He-3
[DE94-629047] p 1527 N95-22179
ACOUSTIC IMAGING
Fiber optic pressure sensing array
[AD-D016245] p 1506 N95-22088
ACOUSTIC IMPEDANCE
Acoustic calibration apparatus for calibrating plethysmographic acoustic pressure sensors
[NASA-CASE-LAR-14977-1] p 1443 N95-20763
ACOUSTIC MEASUREMENT
Analysis of low frequency ocean noise. 1: From a long-term experiment across the US East Coast. 2: From the Wake Island Hydrophone Array during northwest Pacific typhoons
[AD-A284975] p 1432 N95-20040
Characterization and simulation of an acoustic source moving through an oceanic waveguide
[AD-A285688] p 1503 N95-20272
Infrasonic observations of the Northridge, California, earthquake
[DE94-018095] p 1413 N95-20289
Data report: Stress measurements in the bottom boundary layer with BASS tripods STRESS 2 1990-1991
[AD-A279875] p 1433 N95-20433
Acoustic calibration apparatus for calibrating plethysmographic acoustic pressure sensors
[NASA-CASE-LAR-14977-1] p 1443 N95-20763
Laser-Induced Thermal Acoustics (LITA): Four-wave mixing measurement of sound speed, thermal diffusivity, and viscosity
[AD-A286524] p 1372 N95-21009
Effect of atmospheric pressure on measured aircraft noise levels
[PB95-130423] p 1207 N95-21425
Materials for adaptive structural acoustic controls
[AD-A279255] p 1505 N95-21863
Measurement of sound intensity and sound power
[AD-A279246] p 1505 N95-21984
Rapid determination of geoacoustic properties of the sea floor by simulated annealing
[AD-A286297] p 1436 N95-22028
ACOUSTIC PROPAGATION
Model-based inversion for a shallow ocean application
[DE94-016968] p 1433 N95-20420
Evaluation of simple spherical spreading model for near vertical acoustical propagation
[AD-A286284] p 1505 N95-22042
Real time system for practical acoustic monitoring of global ocean temperature
[AD-A286435] p 1436 N95-22209
ACOUSTIC PROPERTIES
Materials for adaptive structural acoustic control, volume 2
[AD-A279222] p 1502 N95-19883
Wavelet transformations for helicopter identification via acoustic signatures
[AD-A279980] p 1504 N95-20963
Active control of fan noise-feasibility study. Volume 1: Flyover system noise studies
[NASA-CR-195392-VOL-1] p 1505 N95-21888
Seismic anisothropy and large-scale porosity inthe ocean floor
[AD-A286580] p 1436 N95-22187
ACOUSTIC SCATTERING
Multiple scatter theory of ocean sediments
[AD-A286033] p 1433 N95-20999
Scattering of an FM signal from an array of spheres
[AD-A285587] p 1505 N95-21213
ACOUSTIC VELOCITY
Model-based inversion for a shallow ocean application
[DE94-016968] p 1433 N95-20420
Laser-Induced Thermal Acoustics (LITA): Four-wave mixing measurement of sound speed, thermal diffusivity, and viscosity
[AD-A286524] p 1372 N95-21009
ACOUSTICS
Acoustic climb to cruise test
[NASA-TM-110504] p 1206 N95-20155
Polyurethane-epoxy interpenetrating polymer network acoustic damping material
[AD-D016567] p 1266 N95-20293
Method and system of mapping acoustic near field
[AD-D016574] p 1504 N95-20296
Laser-Induced Thermal Acoustics (LITA): Four-wave mixing measurement of sound speed, thermal diffusivity, and viscosity
[AD-A286524] p 1372 N95-21009
Nonlinear acoustic processes in a solid rocket engine
[AD-A285606] p 1222 N95-21193
A mixed time integration method for large scale acoustic fluid-structure interaction
[DE94-018327] p 1354 N95-21387
ACOUSTO-OPTICS
Preliminary evaluation of a digital optical systolic processor implemented with acousto-optic cells
[AD-A286377] p 1541 N95-20231
Laser-Induced Thermal Acoustics (LITA): Four-wave mixing measurement of sound speed, thermal diffusivity, and viscosity
[AD-A286524] p 1372 N95-21009
Optical processing and control
[AD-A279157] p 1546 N95-21975
Electro-optic effect in the PESO acousto-optic modulator
[AD-A286355] p 1548 N95-22255
ACRYLIC RESINS
Polyurethane-acrylic interpenetrating polymer network acoustic damping material
[AD-D016572] p 1266 N95-20294
Responsive copolymers for enhanced petroleum recovery
[DE94-018822] p 1267 N95-20350
ACTINIDE SERIES
Research in the chemical sciences: Summaries of FY 1994
[DE94-015427] p 1223 N95-20264
ACTIVATED CARBON
Laboratory evaluation of a reactive baffle approach to NOx control
[AD-A283802] p 1400 N95-19921
ACTIVATION
Novel catalysts for methane activation
[DE95-002639] p 1237 N95-20438
ACTIVATION ENERGY
Aerosol-assisted chemical vapor deposition of copper: A liquid delivery approach to metal thin films
[AD-A279702] p 1270 N95-20689
Modeling the effect of water on mantle rheology
p 1417 N95-21783
Oxidation behavior of aluminum nanopowders
[DE95-002721] p 1260 N95-21926
Studies in nonlinear problems of energy
[DE95-001387] p 1356 N95-22148
The enhancement of metallic silver monomer evaporation by the adhesion of polar molecules to silver nanocluster ions
[AD-A284936] p 1281 N95-22470
ACTIVE CONTROL
Optimal distributed control system for a linear distributed parameter system
[AD-D016583] p 1480 N95-20202
Heterogeneous multi-robot cooperation
[AD-A279839] p 1481 N95-21185
Active control of fan noise-feasibility study. Volume 1: Flyover system noise studies
[NASA-CR-195392-VOL-1] p 1505 N95-21888
Experimental investigations of on-demand vortex generators p 1361 N95-22451
Drag reduction strategies p 1361 N95-22453
Optimal active control for Burgers equations
p 1361 N95-22454
ACTIVITY (BIOLOGY)
The Use of Cyanobacteria to Explore Basic Biological Processes
[DE94-019238] p 1440 N95-22066
ACTIVITY CYCLES (BIOLOGY)
Diffusible driving and coupling signals of the biological clock
[AD-A285353] p 1447 N95-22475
ACTS
Cochannel and adjacent-channel interference in nonlinear minimum-shift-keyed satellite system
[NASA-TM-106834] p 1307 N95-21890
ACTUATORS
Materials for adaptive structural acoustic control, volume 2
[AD-A279222] p 1502 N95-19883
Design of power electronics for TVC and EMA systems
[NASA-CR-196540] p 1312 N95-19909
Collocated tunable wavenumber sensor/actuators for smart structures
[AD-A279608] p 1312 N95-19958
Robust agent control of an autonomous robot with many sensors and actuators
[AD-A280148] p 1479 N95-20011
Collocated tunable wavenumber sensor/actuators for smart structures
[AD-A279066] p 1258 N95-21575
Domain processes in ferroelectric ceramics
[AD-A279567] p 1276 N95-21697
Materials for adaptive structural acoustic controls
[AD-A279255] p 1505 N95-21863
Characterization equipment for electrooptics and actuators
[AD-A286285] p 1546 N95-22043
ADA (PROGRAMMING LANGUAGE)
Software fault tree analysis of concurrent Ada processes
[AD-A284979] p 1457 N95-20042
Artificial Intelligence (AI) and Ada: Integrating AI with mainstream software engineering
[AD-A286093] p 1485 N95-22226
ADAPTATION
Passive monitoring for automated MMPP communication systems p 1293 N95-20927
Adaptive fault-resistant systems
[AD-A286406] p 1484 N95-22203
ADAPTIVE CONTROL
Materials for adaptive structural acoustic control, volume 2
[AD-A279222] p 1502 N95-19883
A-posteriori estimation and adaptive control of the pollution-error in the h-version of the finite element method
[AD-A285670] p 1480 N95-20083
An integrated architecture of adaptive neural network control for dynamic systems
[DE94-014813] p 1481 N95-20693
Adaptive error-control scheme for 2-200 MHz Multiple-Mechanism Propagation Paths
p 1293 N95-20926
Electrorheology for smart automotive suspensions
[AD-A285543] p 1380 N95-21157
Heterogeneous multi-robot cooperation
[AD-A279839] p 1481 N95-21185
Adaptive capture of expert behavior
[DE94-018285] p 1483 N95-21710
Materials for adaptive structural acoustic controls
[AD-A279255] p 1505 N95-21863
ADDITIVES
On commonalities in signal design for non-Gaussian channels
[AD-A285385] p 1498 N95-20608
ALCHEMI of Fe-doped B2-ordered NiAl alloys with different doping levels
[DE94-017748] p 1255 N95-20907
Development of an advanced JP-8 fuel
[AD-A285583] p 1283 N95-21161
ADDUCTS
Synthesis and characterization of single-source molecular precursors to binary metal sulphides: Bis(diethyldithiocarbamato) M(2)trialkylphosphine (M = Zn and Cd) adducts
[AD-A279746] p 1248 N95-22385
ADHESION
Effects of ambient conditions on the adhesion of cubic boron nitride films on silicon substrates
[DE94-016779] p 1266 N95-20281
Preclinical investigation of lyophilized platelet preparations
[AD-A286079] p 1443 N95-20851

Dielectric models in adhesion and extrapolations of molecular modeling
[AD-A279675] p 1516 N95-21121
Methods of measuring adhesion for thermally grown oxide scales
[DE94-018177] p 1256 N95-21260
Copper metallization of stainless steels
[DE95-001496] p 1256 N95-21300
Embedded optical fibres as strain sensors in polymer matrix fibre composites: The influence of adhesion in strain transfer
[PB95-133617] p 1547 N95-22140
The enhancement of metallic silver monomer evaporation by the adhesion of polar molecules to silver nanocluster ions
[AD-A284936] p 1281 N95-22470

ADHESIVE BONDING
Vacuum holding fixture and method for fabricating piezoelectric polymer acoustic sensors
[NASA-CASE-LAR-14240-1] p 1268 N95-20410
Joining of dissimilar materials. A review
[PB95-132999] p 1380 N95-21416
Damage tolerant repair techniques for pressurized aircraft fuselages
[AD-A286298] p 1199 N95-22046

ADHESIVES
Dielectric models in adhesion and extrapolations of molecular modeling
[AD-A279675] p 1516 N95-21121

ADIABATIC CONDITIONS
Front-boundary layer models from STORM-FEST observations
[AD-A279907] p 1428 N95-20186
Ion-molecular spiraling collisions and termolecular recombination
[AD-A285633] p 1517 N95-21151

ADMIXTURES
On the theory of strong electromagnetic waves propagation in an electron-positron-ion plasma
[DE94-628964] p 1561 N95-21850

ADRENAL GLAND
Radiopharmaceuticals for diagnosis
[DE95-002200] p 1445 N95-21595

ADSORBENTS
Mercury capture in bench-scale absorbers
[DE94-016910] p 1234 N95-20107
Natural gas cleanup: Evaluation of a molecular sieve carbon as a pressure swing adsorbent for the separation of methane/nitrogen mixtures
[DE94-012263] p 1234 N95-20135

ADSORPTION
Natural gas cleanup: Evaluation of a molecular sieve carbon as a pressure swing adsorbent for the separation of methane/nitrogen mixtures
[DE94-012263] p 1234 N95-20135
An atomically-resolved STM study of the interaction of phosphine (PH3) with the silicon (001) surface
[AD-A279819] p 1513 N95-20585
Time-resolved analytical methods for liquid/solid interfaces
[DE95-002255] p 1240 N95-20780
An advanced ECR ion source with a large uniformly distributed ECR plasma volume for multiply charged ion beam generation
[DE95-001078] p 1515 N95-20911
Translational-energy-resolved studies of photographed carrier-induced reactions on semiconductor surfaces
[DE95-002944] p 1573 N95-21444
Cluster reactions: An approach to understanding the fundamentals of heterogeneous catalysis
[DE95-002947] p 1243 N95-21447
Development and applications of flat ceramic membranes
[PB95-110219] p 1276 N95-21650
Neutron reflectivity study of adsorbed diblock copolymers
[DE95-002740] p 1281 N95-22434

ADVANCED LAUNCH SYSTEM (STS)
STS 63 flight day 4 highlights/MIR-Shuttle rendezvous
[NASA-TM-110512] p 1219 N95-21113

ADVANCED SOLID ROCKET MOTOR (STS)
Radiation from advanced solid rocket motor plumes
[NASA-CR-196554] p 1221 N95-20124

ADVANCED VERY HIGH RESOLUTION RADIOMETER
Ice Processing System software support documentation
[AD-A280030] p 1388 N95-20006

ADVECTION
Balloon tracking for the ASTEX/MAGE Lagrangian experiment
[AD-A280078] p 1430 N95-20969

AERIAL PHOTOGRAPHY
Guidelines for the creation and management of geographic data bases within a GIS environment, version 1.0. Volume 2. Appendices
[DE94-019215] p 1591 N95-22129
A multispectral scanner survey of the Idaho National Engineering Laboratory and the Hanford Reservation
[DE95-003922] p 1391 N95-22398

AERIAL RECONNAISSANCE
Unmanned aerial vehicles
[AD-A286190] p 1206 N95-20329
Lidar technologies for airborne and space-based applications
[DE95-002954] p 1302 N95-21448
Guidelines for the creation and management of geographic data bases within a GIS environment, version 1.0. Volume 2. Appendices
[DE94-019215] p 1591 N95-22129

AEROACOUSTICS
Active control of fan noise-feasibility study. Volume 1: Flyover system noise studies
[NASA-CR-195392-VOL-1] p 1505 N95-21888
Acoustics of laminar boundary layers breakdown
p 1361 N95-22455
A method for obtaining a statistically stationary turbulent free shear flow p 1363 N95-22463

AEROBRAKING
Simulated rarefied entry of the Galileo probe into the atmosphere of Jupiter
[NASA-TM-110507] p 1601 N95-21621

AERODYNAMIC CHARACTERISTICS
Open Skies project computational fluid dynamic analysis
[AD-A285928] p 1200 N95-19991

AERODYNAMIC DRAG
Investigation of a thermal buoyancy effect on the drag of half models tested in the ARA Transonic Wind Tunnel
[ARA-MEMO-407] p 1199 N95-19946
Free shear layers, base pressure and bluff-body drag
[AD-A286316] p 1200 N95-20175
Research on bluff body vortex wakes
[AD-A286319] p 1200 N95-20177
Simulated rarefied entry of the Galileo probe into the atmosphere of Jupiter
[NASA-TM-110507] p 1601 N95-21621

AERODYNAMIC HEATING
A computer code (SKINTEMP) for predicting transient missile and aircraft heat transfer characteristics
[AD-A286044] p 1341 N95-21001
Temperature effects on acoustic interactions between altitude test facilities and jet engine plumes
[NASA-CR-197638] p 1504 N95-21170

AERODYNAMIC INTERFERENCE
Investigation of a thermal buoyancy effect on the drag of half models tested in the ARA Transonic Wind Tunnel
[ARA-MEMO-407] p 1199 N95-19946

AERODYNAMIC LOADS
Prediction of rotor-blade deformations due to unsteady airloads
[AD-A286593] p 1207 N95-20860

AERODYNAMIC NOISE
Active control of fan noise-feasibility study. Volume 1: Flyover system noise studies
[NASA-CR-195392-VOL-1] p 1505 N95-21888
Acoustics of laminar boundary layers breakdown
p 1361 N95-22455

AERODYNAMICS
Advanced wind turbine design studies: Advanced conceptual study
[DE93-000031] p 1394 N95-20985
Aeronautical engineering: A continuing bibliography with indexes (supplement 315)
[NASA-SP-7037(315)] p 1199 N95-21640
Sandia National Laboratories analysis code data base
[DE95-004188] p 1502 N95-22420

AEROELASTICITY
Prediction of rotor-blade deformations due to unsteady airloads
[AD-A286593] p 1207 N95-20860

AEROGELS
Novel electrochemical materials prepared by sol-gel chemistry
[AD-A286310] p 1226 N95-20092

AERONAUTICAL ENGINEERING
Aeronautical engineering: A continuing bibliography with indexes (supplement 315)
[NASA-SP-7037(315)] p 1199 N95-21640

AEROSOLS
Effects of meteorology on concentrations of acid aerosols
[PB94-209749] p 1400 N95-19965
Aerosol-assisted chemical vapor deposition of copper: A liquid delivery approach to metal thin films
[AD-A279702] p 1270 N95-20689
Balloon tracking for the ASTEX/MAGE Lagrangian experiment
[AD-A280078] p 1430 N95-20969
Project Whitefeather
[DE94-016575] p 1415 N95-21184
Evaluation of the technical performance of the Dutch National Air Quality Monitoring Network in 1992
[PB95-131892] p 1405 N95-21327
Monitoring activities in the framework of the Dutch National Air Quality Monitoring Network in 1994
[PB95-131884] p 1406 N95-21351
High resolution properties of the equatorial Pacific marine atmospheric boundary layer from lidar and radiosonde observations
[DE95-001028] p 1426 N95-21875
Confirmatory analysis of SAGE-1, and -2 data
[DE95-003623] p 1427 N95-22240

AEROSPACE ENGINEERING
NASA/DOD Aerospace Knowledge Diffusion Research Project. Report 28: The technical communication practices of aerospace engineering and science students: Results of the phase 4 cross-national surveys
[NASA-TM-109123] p 1587 N95-20162
NASA/DOD Aerospace Knowledge Diffusion Research Project. Report 31: The technical communications practices of US aerospace engineers and scientists: Results of the phase 1 SME mail survey
[NASA-TM-109169] p 1587 N95-20163
Space fundamentals for the war fighter
[AD-A279703] p 1217 N95-20690
Cost estimating methods for advanced space systems
p 1583 N95-20741
Space technology: Force multiplier or false sense of security
[AD-A279726] p 1217 N95-20995
NASA/DOD Aerospace Knowledge Diffusion Research Project. Report 27: The technical communication practices of engineering and science students: Results of the phase 3 academic surveys
[NASA-TM-109122] p 1589 N95-21015
Spinoff, 1994
[NASA-NP-214] p 1594 N95-21893
NASA patent abstracts bibliography: A continuing bibliography. Section 2: Indexes (supplement 46)
[NASA-SP-7039(46)-SECT-2] p 1590 N95-21948
NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 48: Valuing information in an interactive environment
[NASA-TM-110448] p 1590 N95-21977
Space systems technology working group: Executive report
[AD-A285778] p 1217 N95-22413

AEROSPACE ENVIRONMENTS
Space fundamentals for the war fighter
[AD-A279703] p 1217 N95-20690

AEROSPACE INDUSTRY
The thermal conductivity of carbon-fiber reinforced metal matrix composites
[DE94-017767] p 1226 N95-20125

AEROSPACE MEDICINE
Behavioral effects of tyrosine during sustained wakefulness
[AD-A279789] p 1441 N95-20307
Development and enhancement of a model of performance and decision making under stress in a real life setting
[AD-A285945] p 1449 N95-20393
Modeling platform dynamics and physiological response to short arm centrifugation
[AD-A279640] p 1442 N95-20457
Bibliography of scientific publications 1975-1993
[AD-A279767] p 1444 N95-20977
Effect of increased venous backflow on the release of cardiac hormone. Fine structural, immunohistochemical, and biochemical study
[PB95-130399] p 1445 N95-21424
Aerospace medicine and biology: A continuing bibliography with indexes (supplement 399)
[NASA-SP-7011(399)] p 1446 N95-21947
Command history, 1993
[AD-A279775] p 1446 N95-21989
Age 60 study. Part 1: Bibliographic database
[AD-A286245] p 1446 N95-22027
Age 60 study. Part 2: Airline pilot age and performance. A review of the scientific literature
[AD-A286246] p 1447 N95-22040
Optical radiation: Health based exposure limits for electromagnetic radiation in the wavelength range from 100 nanometer to 1 millimeter
[PB95-132767] p 1447 N95-22083

AEROSPACE SAFETY
Independent review of Aviation Technology and Research Information Analysis System (ATRIAS) database
[AD-A284049] p 1203 N95-21518

AEROSPACE SCIENCES
Bibliography of scientific publications 1975-1993
[AD-A279767] p 1444 N95-20977
Bibliography of Lewis Research Center technical publications announced in 1993
[NASA-TM-106666] p 1589 N95-21187

AEROSPACE SYSTEMS
Space technology: Force multiplier or false sense of security
[AD-A279726] p 1217 N95-20995
Demonstration of multifunctional DNBM corrosion inhibitors in protective coatings for Naval air/weapon systems
[AD-A285869] p 1279 N95-22136
Space systems technology working group: Executive report
[AD-A285778] p 1217 N95-22413

AEROSPACE TECHNOLOGY TRANSFER
NASA/DOD Aerospace Knowledge Diffusion Research Project. Report 31: The technical communications practices of US aerospace engineers and scientists: Results of the phase 1 SME mail survey
[NASA-TM-109169] p 1587 N95-20163
NASA/DOD Aerospace Knowledge Diffusion Research Project. Report 27: The technical communication practices of engineering and science students: Results of the phase 3 academic surveys
[NASA-TM-109122] p 1589 N95-21015
Spinoff, 1994
[NASA-NP-214] p 1594 N95-21893
NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 48: Valuing information in an interactive environment
[NASA-TM-110448] p 1590 N95-21977

AEROTHERMODYNAMICS
Experimental study of vane heat transfer and aerodynamics at elevated levels of turbulence
[NASA-CR-4633] p 1337 N95-19912
A computer code (SKINTEMP) for predicting transient missile and aircraft heat transfer characteristics
[AD-A286044] p 1341 N95-21001
Grid resolution and solution convergence for Mars Pathfinder forebody
[NASA-TM-109173] p 1494 N95-21622

AFRICAN RIFT SYSTEM
Spatial variation of primordial 3-He in crustal fluids along the East-African Rift system (the Ethiopian and the Kenya Rift section) p 1418 N95-21789

AGE FACTOR
Age 60 study. Part 1: Bibliographic database
[AD-A286245] p 1446 N95-22027
Age 60 study. Part 2: Airline pilot age and performance. A review of the scientific literature
[AD-A286246] p 1447 N95-22040

AGGREGATES
Ultra-high aggregate bandwidth two-dimensional multiple-wavelength diode laser arrays
[AD-A280098] p 1372 N95-21019

AGING (BIOLOGY)
Age 60 study. Part 1: Bibliographic database
[AD-A286245] p 1446 N95-22027
Age 60 study. Part 2: Airline pilot age and performance. A review of the scientific literature
[AD-A286246] p 1447 N95-22040

AGING (MATERIALS)
A test of the Arrhenius extrapolation assumption for a nitrile rubber
[DE94-017337] p 1263 N95-19926
Thermodynamic characterization of new palladium alloy tritides
[DE94-018430] p 1579 N95-20028
The 29th MIL-HDBK-17 Polymer Matrix Composites Coordination Group Meeting
[AD-A279917] p 1269 N95-20578
Aging tests of ethylene contaminated argon/ethane
[DE95-002526] p 1282 N95-20899
Properties of aged metal tritides
[DE95-001787] p 1243 N95-21440

AGREEMENTS
Technology transfer: Improving the use of cooperative R/D agreement at DOE's contractor-operated laboratories. Report to Congressional requesters
[GAO/RCED-94-91] p 1586 N95-22403
Space systems technology working group: Executive report
[AD-A285778] p 1217 N95-22413

AH-64 HELICOPTER
Using the backward transfer paradigm to validate the AH-64 Simulator Training Research Advanced Testbed for Aviation
[AD-A285758] p 1215 N95-19931

AIR CONDITIONING
Proceedings of the 1993 Non-Fluorocarbon Insulation, Refrigeration and Air Conditioning Technology Workshop
[DE94-018333] p 1285 N95-20194

AIR DATA SYSTEMS
Response of the B-1B air data sensor to simulated dust cloud environments
[AD-A286134] p 1213 N95-22036

AIR FLOW
Vapor generator wand
[NASA-CASE-LAR-15058-1] p 1215 N95-20080
Fire experiments in a two dimensional rack storage: BRANDFORSK-project 701-917
[PB95-131538] p 1241 N95-21179

AIR LAND INTERACTIONS
Remote-sensing based technique to account for sub-grid scale variability of land surface properties
[NASA-TM-110501] p 1390 N95-22110

AIR MASSES
Indirect global warming effects of ozone and stratospheric water vapor induced by surface methane emission
[DE94-019016] p 1402 N95-20353

AIR NAVIGATION
Modular CNI avionics system p 1213 N95-20659
The personal aircraft: Status and issues
[NASA-TM-109174] p 1200 N95-20688
Assessment of a non-dedicated GPS receiver system for precise airborne attitude determination
[DE94-019309] p 1205 N95-21520
A real-time algorithm for integrating differential satellite and inertial navigation information during helicopter approach
[NASA-CR-197409] p 1205 N95-21891
Recommendation on transition from primary/secondary radar to secondary-only radar capability
[AD-A286279] p 1308 N95-22005

AIR POLLUTION
Calculation methods for criteria air pollutant emission inventories
[AD-A284675] p 1400 N95-19964
Proceedings of the 1993 Non-Fluorocarbon Insulation, Refrigeration and Air Conditioning Technology Workshop
[DE94-018333] p 1285 N95-20194
An application of wavelet transform for decomposition of millimeter-wave spectroscopic signals
[DE94-018366] p 1402 N95-20247
Energy impacts of controlling carbon dioxide emissions from an integrated gasification/combined-cycle system
[DE94-016878] p 1403 N95-20478
Explicit methods for stiff ODEs from atmospheric Chemistry
[PB95-135794] p 1404 N95-21034
Energy and environmental issues and international opperation in Asia
[DE94-796596] p 1404 N95-21143
Ozone quality control measurements in the Dutch National Air Quality Monitoring Network
[PB95-131900] p 1405 N95-21329
Monitoring activities in the framework of the Dutch National Air Quality Monitoring Network in 1994
[PB95-131884] p 1406 N95-21351
New concepts for refrigerant leak detection and mixture measurement
[DE94-018967] p 1287 N95-21559
Removal of CO2 in closed loop off-gas treatment systems
[DE94-019259] p 1407 N95-21617
Comparison of HFC-134a and the ternary blend, Suva MP39, as replacements for the refrigerant, CGC-12
[MRL-GD-0051] p 1287 N95-21625
Air pollution caused by fireworks during the turn of the year 1992-1993
[PB95-135265] p 1409 N95-21718
Ozone-depleting-substance control and phase-out plan
[DE95-001647] p 1409 N95-21722
Derivation of preliminary maximum permissible concentrations of volatile compounds in air
[PB95-107447] p 1410 N95-22125
Assessment of the atmospheric hazards and risks of new chemicals: Procedures to estimate hazard potentials
[PB95-107488] p 1410 N95-22186
Gas-phase photocatalytic oxidation: Cost comparison with other air pollution control technologies
[DE95-000241] p 1410 N95-22278
Urban air carcinogens and their effects on health
[DE95-002259] p 1447 N95-22285
Current concepts on airborne particles and health
[DE95-002260] p 1447 N95-22287
Micrometeorological methods for measurements of mercury emissions over contaminated soils
[DE94-017679] p 1411 N95-22342

AIR PURIFICATION
Laboratory evaluation of a reactive baffle approach to NOx control
[AD-A283802] p 1400 N95-19921

AIR QUALITY
Atmospheric stability and its influence on air quality in small communities in northern Sweden
[PB95-131652] p 1405 N95-21181
Evaluation of the technical performance of the Duttch National Air Quality Monitoring Network in 1992
[PB95-131892] p 1405 N95-21327
Ozone quality control measurements in the Dutch National Air Quality Monitoring Network
[PB95-131900] p 1405 N95-21329
Monitoring activities in the framework of the Dutch National Air Quality Monitoring Network in 1994
[PB95-131884] p 1406 N95-21351
Ozone-depleting-substance control and phase-out plan
[DE95-001647] p 1409 N95-21722

AIR SAMPLING
Effects of meteorology on concentrations of acid aerosols
[PB94-209749] p 1400 N95-19965

AIR TRAFFIC CONTROL
Crew aiding and automation: A system concept for terminal area operations, and guidelines for automation design
[NASA-CR-4631] p 1204 N95-19950
Data link terminal DLT document
[PB95-110805] p 1205 N95-21369
Recommendation on transition from primary/secondary radar to secondary-only radar capability
[AD-A286279] p 1308 N95-22005

AIR TRANSPORTATION
Census US civil aircraft calendar year 1993
[AD-A286309] p 1199 N95-20091
Commuter/air taxi ditchings and water-related impacts that occurred from 1979 to 1989
[AD-A285691] p 1202 N95-20275
The personal aircraft: Status and issues
[NASA-TM-109174] p 1200 N95-20688

AIR WATER INTERACTIONS
The Surface Wave Dynamics Experiment (SWADE): A retrospective look at the wave modeling activities
[AD-A285612] p 1431 N95-19895
Mississippi State University Center for Air Sea Technology FY 1993 and FY 1994 research program in Navy ocean modeling and prediction
[AD-A286322] p 1432 N95-20209
The vertical distribution of heating in the tropical atmosphere
[AD-A285934] p 1429 N95-20391
Boundary layer cloud studies in support of ASTEX
[AD-A285947] p 1429 N95-20395
A study of westerly wind bursts preceding the 1991-1992 El Nino
[AD-A286570] p 1429 N95-20826
Modelling of microwave propagation and clutter in a maritime environment p 1295 N95-20938
The structure of turbulence and other motions beneath an air-water interface
[AD-A279838] p 1434 N95-21293
High resolution properties of the equatorial Pacific marine atmospheric boundary layer from lidar and radiosonde observations
[DE95-001028] p 1426 N95-21875
A numerical study of wind forcing effects on the California Current System
[AD-A286205] p 1435 N95-21880
The dynamic role of ridges in a beta-plane channel. Towards understanding the dynamics of large scale circulation in the Southern Ocean
[AD-A279390] p 1435 N95-21943
Proceedings: International Symposium on Global Change (IGBP)
[DE94-765351] p 1410 N95-22219
SAR-related stress variability in the Marine Atmospheric Boundary Layer (MABL)
[AD-A286462] p 1431 N95-22393

AIRBORNE EQUIPMENT
Passive range measurement system
[AD-D016222] p 1544 N95-21100
Lidar technologies for airborne and space-based applications
[DE95-002954] p 1302 N95-21448
Assessment of a non-dedicated GPS receiver system for precise airborne attitude determination
[DE94-019309] p 1205 N95-21520

AIRBORNE RADAR
Classical analysis methods for designing and developing downlooking radars
[AD-A285760] p 1302 N95-21405
AN/APS-137 Forward Looking Airborne Radar (FLAR) evaluation, Fall 1992 experiment
[AD-A279526] p 1306 N95-21686

AIRCRAFT ACCIDENTS
Commuter airplane accident data analysis
[AD-A286315] p 1202 N95-20174
Commuter/air taxi ditchings and water-related impacts that occurred from 1979 to 1989
[AD-A285691] p 1202 N95-20275
Age 60 study. Part 2: Airline pilot age and performance. A review of the scientific literature
[AD-A286246] p 1447 N95-22040

Analysis of test criteria for specifying foam firefighting agents for aircraft rescue and firefighting
[AD-A286381] p 1203 N95-22352
Forecasting aircraft mishaps using monthly maintenance reports
[AD-A286049] p 1203 N95-22417

AIRCRAFT COMMUNICATION
Crew aiding and automation: A system concept for terminal area operations, and guidelines for automation design
[NASA-CR-4631] p 1204 N95-19950

AIRCRAFT CONSTRUCTION MATERIALS
Round-robin comparison of heat release apparatus
[AD-A285831] p 1363 N95-20031

AIRCRAFT CONTROL
Crew aiding and automation: A system concept for terminal area operations, and guidelines for automation design
[NASA-CR-4631] p 1204 N95-19950

AIRCRAFT DESIGN
F-16XL interview with Marta Bohn-Meyer
[NASA-TM-110505] p 1200 N95-19996
Parallel calculation of sensitivity derivatives for aircraft design using automatic differentiation
[NASA-TM-110103] p 1206 N95-20370
Why do airlines want and use thrust reversers? A compilation of airline industry responses to a survey regarding the use of thrust reversers on commercial transport airplanes
[NASA-TM-109158] p 1203 N95-20706

AIRCRAFT ENGINES
Turbine design and application
[NASA-SP-290] p 1214 N95-22341

AIRCRAFT EQUIPMENT
FASTPACK: Optimized solutions for modular avionics derived from a parametric study. Part 1: Platform features p 1208 N95-20634
Immersion/two phase cooling p 1211 N95-20648
Composite cases for airborne electronic equipment: A technology study and EMC p 1212 N95-20655
Lightweight electronic enclosures using composite materials p 1213 N95-20656
Modular supplies for a distributed architecture --- avionics packaging p 1213 N95-20657
Modular CNI avionics system p 1213 N95-20659
TIM-SCT cable testing protocol
[AD-A286633] p 1207 N95-20772
Design of a controller for a flexible pointing system using H(infinity) synthesis
[AD-A286572] p 1481 N95-20828
Fuzzy clustering of facial form for prototyping environmental protection equipment
[DE94-014657] p 1454 N95-22466

AIRCRAFT FUELS
Analysis of test criteria for specifying foam firefighting agents for aircraft rescue and firefighting
[AD-A286381] p 1203 N95-22352

AIRCRAFT INDUSTRY
Public-sector aviation issues: Graduate research award papers, 1992-1993
[PB94-217478] p 1199 N95-19967

AIRCRAFT LANDING
Super-heavy aircraft study
[AD-A279602] p 1215 N95-19955
F-15 resource tape
[NASA-TM-110502] p 1206 N95-19994
Minima reduction simulation test results
[AD-A285626] p 1204 N95-21148

AIRCRAFT MAINTENANCE
Why do airlines want and use thrust reversers? A compilation of airline industry responses to a survey regarding the use of thrust reversers on commercial transport airplanes
[NASA-TM-109158] p 1203 N95-20706
Damage tolerant repair techniques for pressurized aircraft fuselages
[AD-A286298] p 1199 N95-22046
Forecasting aircraft mishaps using monthly maintenance reports
[AD-A286049] p 1203 N95-22417

AIRCRAFT MANEUVERS
F-15 resource tape
[NASA-TM-110502] p 1206 N95-19994

AIRCRAFT MODELS
Effects of yaw and pitch motion on model attitude measurements
[NASA-TM-4641] p 1368 N95-22109

AIRCRAFT NOISE
Acoustic climb to cruise test
[NASA-TM-110504] p 1206 N95-20155
Effect of atmospheric pressure on measured aircraft noise levels
[PB95-130423] p 1207 N95-21425

AIRCRAFT PARTS
Electrochemical impedance pattern recognition for detection of hidden chemical corrosion on aircraft components
[AD-A285998] p 1239 N95-20716

AIRCRAFT PERFORMANCE
F-15 resource tape
[NASA-TM-110502] p 1206 N95-19994
Naval aviation: F-14 upgrades are not adequately justified. Report to Congressional Committees
[AD-A286338] p 1206 N95-20212
Why do airlines want and use thrust reversers? A compilation of airline industry responses to a survey regarding the use of thrust reversers on commercial transport airplanes
[NASA-TM-109158] p 1203 N95-20706

AIRCRAFT PILOTS
Effects of bifocal and progressive-addition corrective lenses on aviator target-detection performance
[AD-A279698] p 1442 N95-20710
Age 60 study. Part 1: Bibliographic database
[AD-A286245] p 1446 N95-22027
Age 60 study. Part 2: Airline pilot age and performance. A review of the scientific literature
[AD-A286246] p 1447 N95-22040

AIRCRAFT POWER SUPPLIES
Photovoltaic electric power applied to Unmanned Aerial Vehicles (UAV) p 1321 N95-20530

AIRCRAFT SAFETY
Commuter airplane accident data analysis
[AD-A286315] p 1202 N95-20174
Commuter/air taxi ditchings and water-related impacts that occurred from 1979 to 1989
[AD-A285691] p 1202 N95-20275
Fuselage burnthrough from large exterior fuel fires
[AD-A286295] p 1203 N95-22318
Forecasting aircraft mishaps using monthly maintenance reports
[AD-A286049] p 1203 N95-22417

AIRCRAFT SPECIFICATIONS
Analysis of test criteria for specifying foam firefighting agents for aircraft rescue and firefighting
[AD-A286381] p 1203 N95-22352

AIRCRAFT STRUCTURES
Corrosion of aircraft materials: Correlation between nanometer scale and macroscopic structural damage parameters
[AD-A285930] p 1252 N95-20299
Eddy current for detecting second-layer cracks under installed fasteners
[AD-A279871] p 1382 N95-20414
Electrochemical impedance pattern recognition for detection of hidden chemical corrosion on aircraft components
[AD-A284998] p 1253 N95-20481

AIRCRAFT SURVIVABILITY
Commuter airplane accident data analysis
[AD-A286315] p 1202 N95-20174
Commuter/air taxi ditchings and water-related impacts that occurred from 1979 to 1989
[AD-A285691] p 1202 N95-20275

AIRFOILS
Public-sector aviation issues: Graduate research award papers, 1992-1993
[PB94-217478] p 1199 N95-19967
F-16XL interview with Marta Bohn-Meyer
[NASA-TM-110505] p 1200 N95-19996
Computation of transonic flow on composite overlapping grids in 2 D
[PB95-131348] p 1353 N95-21132
Unstructured-grid large-eddy simulation of flow over an airfoil p 1202 N95-22448

AIRFRAMES
Lift enhancement device
[AD-D016522] p 1201 N95-21864

AIRLINE OPERATIONS
Public-sector aviation issues: Graduate research award papers, 1992-1993
[PB94-217478] p 1199 N95-19967
Test and evaluation report for the Manual Domestic Passive Profiling System (MDPPS)
[AD-A286312] p 1202 N95-20093

AIRPORT SECURITY
Test and evaluation report for the Manual Domestic Passive Profiling System (MDPPS)
[AD-A286312] p 1202 N95-20093

AIRPORTS
Test and Evaluation Plan (TEP) for Improvised Explosive Device Screening Systems (IEDSS)
[AD-A286382] p 1203 N95-22319
Analysis of test criteria for specifying foam firefighting agents for aircraft rescue and firefighting
[AD-A286381] p 1203 N95-22352

AIRSHIPS
CALIOPE and TAISIR airborne experiment platform
[DE94-018328] p 1310 N95-22299

AIRSPEED
A real-time algorithm for integrating differential satellite and inertial navigation information during helicopter approach
[NASA-CR-197409] p 1205 N95-21891

AIRY FUNCTION
Solutions of D(sup n)D(sup m)f=0
[PB95-110839] p 1487 N95-19916

ALBUMINS
Separation of proteins by convective electrophoresis through a porous membrane
[PB95-127130] p 1248 N95-22373

ALCOHOLS
Bioconversion of coal derived synthesis gas to liquid fuels
[DE94-017381] p 1282 N95-19927
Investigation of syngas interaction in alcohol synthesis catalysts
[DE94-018784] p 1236 N95-20349
An improved and facile method for the synthesis of 1,1-bis(4-hydroxyphenyl) 2-phenylethylene and its derivatives
[DE95-001125] p 1240 N95-20836

ALEXANDRITE
Scaling of solid state lasers for satellite power beaming applications
[DE94-016366] p 1368 N95-19986

ALGAE
Effects of increased UV-B radiation on phytoplankton: A preliminary study and research programme
[PB95-133732] p 1439 N95-21884

ALGEBRA
Algebraic semantics of message sequence charts
[PB95-110581] p 1288 N95-19890
Non interleaving process algebra
[PB95-110607] p 1486 N95-19892
General conservative extension theorem in process algebra
[PB95-110656] p 1487 N95-19902
Process algebra with partial choice
[PB95-110714] p 1487 N95-19907
Real time process algebra with infinitesimals
[PB95-110623] p 1488 N95-20055
The design of a parallel, dense linear algebra software library: Reduction to Hessenberg, tridiagonal, and bidiagonal form
[DE94-018123] p 1491 N95-20701
The PROSAIC Laplace and Fourier Transform
[DE95-002225] p 1492 N95-21266
Regularity of BPa-systems is decidable
[PB95-135489] p 1468 N95-21619
Adjunctions
[PB95-134078] p 1494 N95-21868
Performance analysis and true concurrency semantics
[PB95-134086] p 1478 N95-21869
Graded dual of the non-commutative universal Leibniz Hopf algebra zeta
[PB95-134532] p 1494 N95-21955
Discrete algebraic Riccati equation and linear matrix inequality
[PB95-133575] p 1484 N95-22139
Maximum weighted matching for high index differential algebraic equations
[PB95-135075] p 1496 N95-22359

ALGORITHMS
O(log2 n) time efficient parallel factorization of dense, sparse separable, and banded matrices
[NASA-CR-197356] p 1473 N95-19885
K(1,3)-free and W(4)-free graphs
[PB95-110573] p 1456 N95-19889
Introduction to the FIRE engine: A C++ toolkit for Finite automata and Regular Expressions
[PB95-110599] p 1456 N95-19891
Dominoes
[PB95-110680] p 1456 N95-19905
Toward a design for the ITER plasma shape and stability control system
[DE94-017516] p 1548 N95-20037
ILIAS: A sequential language for parallel matrix computations
[PB95-110631] p 1473 N95-20056
Truly distribution-independent algorithms for the N-body problem
[DE94-014238] p 1458 N95-20136
A domain decomposition scheme for Eulerian shock physics codes
[DE94-015739] p 1488 N95-20141
Parallel solid mechanics codes at Sandia National Laboratories
[DE94-015770] p 1474 N95-20152
Adaptive path planning for flexible manufacturing
[DE94-016561] p 1459 N95-20284
Using local optimality criteria for efficient information retrieval with redundant information filters
[AD-A279603] p 1587 N95-20302

Radiative forcing calculations for CH3Cl
[DE94-019018] p 1402 N95-20355
Hybrid model in general geometry
[DE95-002614] p 1553 N95-20437
Computing methods for the approximate solution of time dependent problems
[AD-A286007] p 1491 N95-20719
COYOTE II: A finite element computer program for nonlinear heat conduction problems. Part 1: Theoretical background
[DE95-002587] p 1463 N95-20887
Real-time reconfiguration study
[AD-A286060] p 1464 N95-20910
Superresolution direction finding algorithms for the characterisation of multi-moded HF signals
p 1299 N95-20958
Proceedings of the Fourth International Workshop on Inductive Logic Programming (ILP-94)
[PB95-135273] p 1464 N95-21003
Correctness of some algorithms to generate finite automata for regular expressions
[PB95-127551] p 1465 N95-21022
Finding all minimal separators of a graph
[PB95-127585] p 1491 N95-21023
Attempt to interpret the self-organizing mapping physiologically
[PB95-127783] p 1438 N95-21112
Project Whitefeather
[DE94-016575] p 1415 N95-21184
A divide-and-conquer method for tridiagonalizing symmetric matrices with repeated eigenvalues
[DE95-002918] p 1476 N95-21257
Computing near-optimal schedules
[PB95-132072] p 1466 N95-21269
Real-time dynamic simulator for the Topaz II reactor power system
[DE95-001604] p 1535 N95-21278
Synthetic aperture radar processing with polar formatted subapertures
[DE95-001830] p 1302 N95-21305
Accurate solution algorithms for incompressible multiphase flows
[DE95-002727] p 1353 N95-21317
A framework for symmetric band reduction and tridiagonalization
[DE95-002919] p 1476 N95-21341
Proposal for a tutorial on Minimal Length Encoding (MLE) in molecular biology
[DE94-015076] p 1438 N95-21376
Unknown-terrains navigation of a mobile robot using an array of sonars
[DE94-017902] p 1482 N95-21385
A mixed time integration method for large scale acoustic fluid-structure interaction
[DE94-018327] p 1354 N95-21387
An image cancellation approach to depth-from-focus
[DE94-019312] p 1544 N95-21392
VLUGR3: A vectorizable adaptive grid solver for PDEs in 3D. 1: Algorithmic aspects and applications
[PB95-135729] p 1467 N95-21435
Distribution-independent hierarchical N-body methods
[DE95-001686] p 1493 N95-21439
Approximation algorithms for the general and the asymmetric stacker-crane problems
[PB95-132098] p 1493 N95-21468
Utilizing artificial neural networks in network flow analysis: An annotated bibiliography
[DE95-002453] p 1482 N95-21522
Numerical and symbolic algorithms for application and specific signal processing
[AD-A279802] p 1305 N95-21576
A new Krylov-subspace method for symmetric indefinite linear systems
[DE95-001826] p 1355 N95-21726
Learning algorithms for feedforward networks based on finite samples
[DE95-001739] p 1483 N95-21741
QMRPACK user's guide
[DE95-001770] p 1469 N95-21744
Science with High Spatial Resolution Far-Infrared Data
[NASA-CR-197353] p 1595 N95-21749
Constraints as a destriping tool for Hires images
p 1593 N95-21756
A HIRES analysis of the FIR emission of supernova remnants p 1594 N95-21770
Application of MCM image construction to IRAS comet observations p 1594 N95-21772
A massively parallel algorithm for grand canonical Monte Carlo computer simulation with the short-ranged Lennard-Jones potential
[DE94-010396] p 1477 N95-21843
Compositional approach to sequential consistency and lazy caching
[PB95-134110] p 1455 N95-21871
A real-time algorithm for integrating differential satellite and inertial navigation information during helicopter approach
[NASA-CR-197409] p 1205 N95-21891
A syncopated leap-frog algorithm for orbit consistent plasma simulation of materials processing reactors
[DE95-000954] p 1561 N95-21922
Massively-parallel computational fluid dynamics
[AD-A279389] p 1355 N95-21942
On Markov Chain Monte Carlo acceleration
[AD-A279393] p 1499 N95-21945
Balanced 0, + or - matrices. Part 2: Recognition algorithm
[AD-A279156] p 1470 N95-21974
Fast algorithms for transport models
[DE95-001702] p 1470 N95-21992
Absorbing boundary condition for floating two-dimensional objects in current and waves
[PB95-132882] p 1356 N95-22063
A Davis-Putnam program and its application to finite-order model search: Quasigroup existence problems
[DE95-003014] p 1471 N95-22077
Full potential multiple scattering theory
[DE95-003197] p 1576 N95-22084
Tom Thumb algorithm for planning simple vehicle motions
[PB95-107553] p 1484 N95-22156
Real time system for practical acoustic monitoring of global ocean temperature
[AD-A286435] p 1436 N95-22209
Inverse and control problems in electromagnetics
[AD-A286438] p 1310 N95-22250
Learning maneuvers using neural network models
[AD-A286470] p 1486 N95-22267
An improved Monte Carlo algorithm for simulating grain growth
[DE94-017903] p 1578 N95-22272
Fast parallel tree codes for gravitational and fluid dynamical N-body problems
[AD-A286480] p 1358 N95-22290
A new parallel method for molecular dynamics simulation of macromolecular systems
[DE94-018621] p 1529 N95-22315
Maximum weighted matching for high index differential algebraic equations
[PB95-135075] p 1496 N95-22359
Experimental evaluation of dynamic data allocation strategies in a distributed database with changing workloads
[NASA-CR-195024] p 1456 N95-22431
Direct numerical simulations of on-demand vortex generators: Mathematical formulation
p 1361 N95-22452

ALIGNMENT
Testing of the SAIC facets on the stretched-membrane dish
[DE95-001831] p 1393 N95-20864
Issues in multi-bunch emittance preservation in the NLC
[DE95-002894] p 1534 N95-21253
Object recognition by alignment using invariant projections of planar surfaces
[AD-A279841] p 1468 N95-21495
Magnetostrictive motor system
[AD-D016484] p 1333 N95-21901
Design, fabrication, and characterization of reflective diffractive optical elements in Si for free-space optical interconnects
[AD-A286416] p 1547 N95-22205
Target alignment in the National Ignition Facility
[DE94-015559] p 1540 N95-22469

ALKALI HALIDES
The dynamics of formation and evaporation of mixed alkali halide nanocrystals: A case of comparable lattice energies
[AD-A285052] p 1567 N95-20483
Identification of resonant, two-electron, and inter-atomic features in K and L23 NEXAFS spectra
[AD-A285374] p 1513 N95-20554

ALKALI METALS
The dynamics of formation and evaporation of mixed alkali halide nanocrystals: A case of comparable lattice energies
[AD-A285052] p 1567 N95-20483

ALKALIES
Recent photoabsorption measurements in the rare gases and alkalis in the 3 to 15 keV photon energy region
[DE94-019278] p 1521 N95-21406
Alkali element depletion by core formation and vaporization on the early Earth p 1421 N95-21804
Resonant charge transfer in hyperthermal atomic and molecular ion-surface collisions
[AD-A284937] p 1530 N95-22471

ALKALINITY
Nickel hydroxide electrodes in reduced-alkalinity electrolytes
[DE95-002333] p 1326 N95-20814

ALKANES
Scanning tunneling microscopy studies of self-assembled monolayers of alkanethiols on gold
[AD-A279910] p 1253 N95-20577
Studies of the n-alkane/water interface by total internal reflection second harmonic generation
[AD-A279473] p 1245 N95-21827

ALKENES
Hydrogenation of nitriles on a well-characterized nickel surface: From surface science studies to liquid phase catalytic activity measurements
[DE94-018184] p 1259 N95-21707

ALKYL COMPOUNDS
Polyurethane-acrylic interpenetrating polymer network acoustic damping material
[AD-D016572] p 1266 N95-20294
Novel reagents for chemical vapor deposition of intermetallic alloys
[AD-A286562] p 1271 N95-20815
Restricted mass transport effects on free radical reactions
[DE94-018136] p 1217 N95-21706
Towards tailored interphase formation utilizing surface-bound benzylsulfonium salts as cationic initiators
[AD-A286461] p 1280 N95-22259

ALLOYING
Thermodynamic characterization of new palladium alloy tritides
[DE94-018430] p 1579 N95-20028
Development of superplasticity in 5083 aluminum with additions of Mn and Zr
[DE94-017474] p 1251 N95-20090
Enhancement of corrosion resistance and mechanical properties of light-weight metals through the use of graded nonequilibrium microstructures
[AD-A286320] p 1251 N95-20178
2nd International ADI seminar
[PB95-127734] p 1255 N95-21108
Nitrogen alloyed martensitic steels
[PB95-127791] p 1255 N95-21128
Tribology and surface mechanical properties of excimer laser nitrided titanium
[DE95-002751] p 1255 N95-21238
Atom probe field ion microscopy of type 308 CRE stainless steel welds
[DE94-019162] p 1261 N95-22127

ALLYL COMPOUNDS
Radiation-induced modifications of allylamino-substituted polyphosphazenes
[AD-A279694] p 1268 N95-20428

ALPHA PARTICLES
A new alpha particle diagnostic using knock-on ion tails
[DE94-015856] p 1553 N95-20402
Radioactive check sources for alpha and beta sensitive radiological instrumentation
[DE94-016477] p 1366 N95-21138
Experimental investigations of electron capture from atomic hydrogen and deuterium by alpha particles
[DE95-002138] p 1523 N95-21587
Intense proton beam source for ITER neutral-beam spectroscopy diagnostics
[DE94-018092] p 1560 N95-21668

ALTERNATING CURRENT
Power-law resistivity, magnetic relaxation and ac susceptibility
[DE94-016893] p 1501 N95-20241
A low temperature, ultrahigh vacuum, microwave-frequency-compatible scanning tunneling microscope
[AD-A279869] p 1365 N95-20413
Linear and nonlinear spectroscopy with the tunable AC scanning tunneling microscope
[AD-A285751] p 1241 N95-21217
Small cavity nonresonant tunable microwave-frequency alternating current scanning tunneling microscope
[AD-A285752] p 1328 N95-21218
AC magnetic response of YBa2CuO7 with Y2BaCuO5 inclusions and of single-crystal YBa2Cu3O7: A comparative study
[PB94-207917] p 1577 N95-22166

ALTERNATIVES
Mercury usage and alternatives in the electrical and electronics industries
[PB94-165362] p 1312 N95-19966
The advanced technology crew station: Development and validation of a workload assessment technique for cockpit function allocation
[AD-A279544] p 1453 N95-21691

ALTITUDE TESTS
Temperature effects on acoustic interactions between altitude test facilities and jet engine plumes
[NASA-CR-197638] p 1504 N95-21170
ALUMINATES
High performance YBCO films
[AD-A279560] p 1276 N95-21695
ALUMINIDES
Third Intermetallic Matrix Composites Symposium, volume 350
[NASA-TM-110059] p 1225 N95-20001
Fabrication and properties of alumina matrix composites containing nickel aluminide reinforcements
[DE94-018703] p 1250 N95-20044
Oxide formation on NbAl3 and TiAl due to ion implantation of O-18
[DE94-017874] p 1252 N95-20365
Processing and applications of iron aluminides
[DE94-017855] p 1253 N95-20673
Impact behavior of FeAl alloy FA-350
[DE94-018128] p 1254 N95-20705
Processing and mechanical properties of laminar Al2O3-Ni3Al composites
[DE94-019332] p 1230 N95-21481
Weldability of iron aluminides
[DE94-019114] p 1257 N95-21555
Consequences of oscillatory potentials and angular forces in transition metals and their aluminides
[DE94-019127] p 1258 N95-21600
The development of a super-alpha2 titanium aluminide alloy consolidated by rapid omnidirectional compaction
[AD-A279254] p 1260 N95-21986
Tensile and impact properties of iron-aluminum alloys
[DE94-017750] p 1263 N95-22346
ALUMINUM
A computational study of projectile shape dependence on phase change phenomena with comparisons to experimental data
[DE95-000740] p 1384 N95-20077
A computational study of projectile melt in impact with typical Whipple shields
[DE94-016454] p 1385 N95-20237
Corrosion of aircraft materials: Correlation between nanometer scale and macroscopic structural damage parameters
[AD-A285930] p 1252 N95-20299
The design and manufacturing development of an active silicon substrate MCM p 1211 N95-20645
Polyurethane self-priming topcoats
[AD-D016204] p 1274 N95-21154
Effect of laser radiation on carbon fibre/epoxy composites
[PB95-133526] p 1232 N95-22096
ALUMINUM ALLOYS
Processing and characterization of Ni-Al-Fe-B shape-memory alloy wires produced by rapid solidification
[DE94-017702] p 1250 N95-20020
Development of superplasticity in 5083 aluminum with additions of Mn and Zr
[DE94-017474] p 1251 N95-20090
Enhancement of corrosion resistance and mechanical properties of light-weight metals through the use of graded nonequilibrium microstructures
[AD-A286320] p 1251 N95-20178
Electrochemical impedance pattern recognition for detection of hidden chemical corrosion on aircraft components
[AD-A284998] p 1253 N95-20481
The processing and mechanical properties of high temperature/high performance composites. Book 7: In-situ measurements of stress and damage
[AD-A279814] p 1227 N95-20583
The mechanical property data base from an Air Force/Industry cooperative test program on advanced aluminum alloys
[AD-A280038] p 1386 N95-20615
Processing and applications of iron aluminides
[DE94-017855] p 1253 N95-20673
Electrochemical impedance pattern recognition for detection of hidden chemical corrosion on aircraft components
[AD-A285998] p 1239 N95-20716
ALCHEMI of Fe-doped B2-ordered NiAl alloys with different doping levels
[DE94-017748] p 1255 N95-20907
Electrochemical impedance spectroscopy of trivalent chromium pre-treated aluminum alloy
[AD-A280093] p 1240 N95-20970
Tribology and surface mechanical properties of excimer laser nitrided titanium
[DE95-002751] p 1255 N95-21238
Processing and mechanical properties of laminar Al2O3-Ni3Al composites
[DE94-019332] p 1230 N95-21481
Consequences of oscillatory potentials and angular forces in transition metals and their aluminides
[DE94-019127] p 1258 N95-21600
Relationship between dendrite coherency and castability of some commercial foundry alloys
[PB95-110243] p 1258 N95-21652
Fracture behavior of the Fe-8Al alloy FAP-Y
[DE95-000956] p 1258 N95-21676
Aircraft corrosion study
[AD-A279527] p 1259 N95-21687
Electronic structure and relative stability of icosahedral superatoms in Al-transition-metal alloys
[DE94-628996] p 1260 N95-21855
Demonstration of multifunctional DNBM corrosion inhibitors in protective coatings for Naval air/weapon systems
[AD-A285869] p 1279 N95-22136
Bulk and defect properties of ordered intermetallics
[DE94-017706] p 1262 N95-22344
Processing of intermetallic materials by reaction synthesis
[DE94-017710] p 1263 N95-22345
Tensile and impact properties of iron-aluminum alloys
[DE94-017750] p 1263 N95-22346
Fracture behavior of laminated discontinuously reinforced aluminum material
[DE94-017307] p 1263 N95-22408
ALUMINUM ARSENIDES
Resonant generation of nonequilibrium phonons in GaAs/AlAs quantum wells via intersubband scattering
[DE95-002338] p 1581 N95-21604
ALUMINUM CHLORIDES
Chemistry and electrochemistry in Lewis acid and superacid ionic liquids
[AD-A279396] p 1246 N95-21931
ALUMINUM GALLIUM ARSENIDE LASERS
Semiconductor laser joint study program with Rome Laboratory
[AD-A285858] p 1369 N95-20379
ALUMINUM GALLIUM ARSENIDES
Analog processing of optical wavefront using integrated guided-wave optics
[AD-A279596] p 1543 N95-20601
Transient photoluminescence measurements on GaAs and AlGaAs double heterostructures
[AD-A279408] p 1575 N95-21916
ALUMINUM NITRIDES
Synthesis and studies of organometallic precursors for CVD of thin film electronic materials
[AD-A285834] p 1223 N95-20033
ALUMINUM OXIDES
Comparison of the dynamic fatigue behavior of two monolithic SiC and an Al2O3/SiC composite
[DE94-017751] p 1225 N95-20022
Properties of whisker-reinforced ceramics
[DE94-017759] p 1264 N95-20024
Fabrication and properties of alumina matrix composites containing nickel aluminide reinforcements
[DE94-018703] p 1250 N95-20044
Reactions and microstructure at ceramic/metal interfaces
[DE94-014287] p 1265 N95-20138
Structural performance of cylindrical pressure housings of different ceramic compositions under external pressure loading. Part 1: Isostatically pressed alumina ceramic
[AD-A279669] p 1270 N95-20603
Reactive nanophase oxide additions to melt-processed high-T(sub c) superconductors
[DE95-001470] p 1570 N95-20841
Self-starting femtosecond pulse generation from a Ti:sapphire laser synchronously pumped by a pointing-stabilized mode-locked Nd:YAG laser
[DE94-019319] p 1374 N95-21480
Processing and mechanical properties of laminar Al2O3-Ni3Al composites
[DE94-019332] p 1230 N95-21481
Light output and radiation damage in a YAlO3:Ce crystal
[DE94-016815] p 1545 N95-21643
Directional solidification of the alumina-zirconia ceramic eutectic system
[DE95-001677] p 1277 N95-21735
Creep behavior in SiC whisker-reinforced alumina composite
[DE95-001071] p 1231 N95-21776
Oxidation behavior of aluminum nanopowders
[DE95-002721] p 1260 N95-21926
Structural performance of cylindrical pressure housings of different ceramic compositions under external pressure loading. Part 4: Silicon carbide particulate reinforced alumina ceramic
[AD-A286299] p 1279 N95-22047
Aluminium oxide targets after ballistic impact; fragmentation of the ceramic and the projectile
[PB95-133625] p 1388 N95-22097
Acid-site characterization of water-oxidized alumina films by near-edge x-ray absorption and soft x-ray photoemission
[DE95-003355] p 1247 N95-22234
Measurement of residual stresses on ceramic materials with high spatial resolution
[DE94-017889] p 1280 N95-22270
ALUMINUM SILICATES
A transmission electron microscope characterization of sodium sulfate hot corrosion of silicon carbide fiber-reinforced lithium aluminosilicate glass-ceramic matrix composite
[AD-A286164] p 1231 N95-22038
ALUMINUM-LITHIUM ALLOYS
The mechanical property data base from an Air Force/Industry cooperative test program on advanced aluminum alloys
[AD-A280038] p 1386 N95-20615
AMBIENCE
Effects of meteorology on concentrations of acid aerosols
[PB94-209749] p 1400 N95-19965
Ambient noise and surface wave dissipation in the ocean
[AD-A279650] p 1432 N95-20303
Ultraviolet emission from rocket motor plumes
[DSTO-TR-0002] p 1222 N95-21661
AMBIENT TEMPERATURE
Visible and near-IR spectroscopic studies of UC1(4) in a basic ambient temperature melt: The observation of a possible geometric distorted UC1(6)(exp 2-) species and the evidence for the hydrogen-bond in the melt
[DE94-017764] p 1237 N95-20493
Gas-phase photocatalytic oxidation: Cost comparison with other air pollution control technologies
[DE95-000241] p 1410 N95-22278
AMBIPOLAR DIFFUSION
Stellarator transport optimization with self-consistent electric fields
[DE94-019151] p 1559 N95-21581
AMIDES
Responsive copolymers for enhanced petroleum recovery
[DE94-018822] p 1267 N95-20350
AMINES
Hydrogenation of nitriles on a well-characterized nickel surface: From surface science studies to liquid phase catalytic activity measurements
[DE94-018184] p 1259 N95-21707
AMINO ACIDS
New methods for large scale local and global optimization
[AD-A285635] p 1517 N95-21126
AMMONIA
Monitoring activities in the framework of the Dutch National Air Quality Monitoring Network in 1994
[PB95-131884] p 1406 N95-21351
Development of active-transport membrane devices
[DE94-015947] p 1246 N95-21921
AMMONIUM BROMIDES
Responsive copolymers for enhanced petroleum recovery
[DE94-018822] p 1267 N95-20350
AMMONIUM COMPOUNDS
Thermodynamic and NMR studies of solvent effect on enantiomeric recognition for a chiral organiz ammonium cation by chiral diketopyridino-18-Crown-6 type ligands at 25.0 C
[AD-A279893] p 1223 N95-20592
Neutron molelcular spectroscopy: Future prospects
[PB95-130357] p 1518 N95-21227
AMMONIUM NITRATES
An update of corrosion inhibitors for mild steel exposed to 32-0-0 UAN solution
[DE95-001715] p 1263 N95-22396
AMMUNITION
Evaluation of state-of-the-art high speed deluge systems presently in service at various US Army ammunition plants
[AD-A279102] p 1287 N95-21598
AMORPHOUS MATERIALS
Optical multilayers with an amorphous fluoropolymer
[DE94-017693] p 1541 N95-20218
Amorphization of sapphire during ion beam mixing
[DE94-018713] p 1510 N95-20337
A mechanistic model for radiation-induced crystallization and amorphization in U3Si
[DE94-015028] p 1566 N95-20419
Amorphous silicon thin films: The ultimate lightweight space solar cell p 1318 N95-20515
Application of new synchrotron powder diffraction techniques to anomalous scattering from glasses
[DE94-019285] p 1536 N95-21407
Magnetic properties of the three-dimensional Ising model with an interface amorphization
[DE94-628992] p 1278 N95-21885

Surfaces and thin films studied by picosecond ultrasonics
[DE95-001866] p 1506 N95-22071
Surface technology programme
[PB95-132866] p 1262 N95-22174

AMORPHOUS SILICON
Amorphous silicon thin films: The ultimate lightweight space solar cell p 1318 N95-20515
Investigation of the stability and 1.0 MeV proton radiation resistance of commercially produced hydrogenated amorphous silicon alloy solar cells p 1320 N95-20522
Processing and modeling issues for thin-film solar cell devices
[DE94-011895] p 1394 N95-21294

AMOUNT
Analysis of test criteria for specifying foam firefighting agents for aircraft rescue and firefighting
[AD-A286381] p 1203 N95-22352

AMPHIBOLES
D/H ratios and H2O contents of mantle-derived amphibole megacrysts from Dish Hill, California
p 1416 N95-21781
Subduction of hydrated basalt of the oceanic crust: Implications for recycling of water into the upper mantle and continental growth p 1423 N95-21814

AMPLIFICATION
On FEL integral equation and electron energy loss in intermediate gain regime
[DE94-770631] p 1371 N95-20757
Collisional redistribution effects on x ray laser saturation behavior
[DE94-017308] p 1374 N95-21663
Molecular design concept for multi-kilovolt x-ray amplification
[DE95-001763] p 1374 N95-21743
Pre-amplifier with multi-stage feedback
[AD-D016254] p 1336 N95-22418

AMPLIFIER DESIGN
Hybrid high power amplifier
[AD-D016534] p 1326 N95-20730

AMPLIFIERS
Pasotron(TM) technology
[AD-A279994] p 1314 N95-20311
Plasma Electrode Pockels Cells for the Beamlet and NIF lasers
[DE94-016541] p 1557 N95-21166

AMPLITUDE MODULATION
Determination of multiple sound sources
[AD-A286563] p 1504 N95-20823

AMPLITUDES
Effect of cell size on elliptically polarized radar clutter statistics
[AD-A285789] p 1311 N95-22401

ANAEROBES
Anaerobic Treatment of Municipal Solid Waste and Sludge for Energy Production and Recycling of Nutrients
[DE95-700217] p 1315 N95-20369
Microbiology and physiology of anaerobic fermentations of cellulose
[DE95-002899] p 1438 N95-20917

ANALOG CIRCUITS
Solid state research
[AD-A279662] p 1567 N95-20426

ANALOG TO DIGITAL CONVERTERS
Development of a fast sampling system for estimation of impulse responses of mobile radio channels
p 1296 N95-20943
Non-linear A/D converters for integrated silicon smart sensors
[PB94-208402] p 1330 N95-21590
Design of a 10 bit 10k Samples/s low power CMOS ADC
[PB95-110425] p 1455 N95-22018
SEU and SEL response of the Westinghouse 64K E-2PROM, analog devices AD7876 12-bit ADC, and the Intel 82527 Serial Communications Controller
[DE95-003349] p 1334 N95-22086

ANALOGIES
Role of working memory limitations of retrieval
[AD-A280032] p 1448 N95-20007

ANALYSIS (MATHEMATICS)
Transactions of the Eleventh Army Conference on Applied Mathematics and Computing
[AD-A279884] p 1497 N95-22389

ANALYTIC FUNCTIONS
Solutions of D(sup n)D(sup m)f=0
[PB95-110839] p 1487 N95-19916
Sharp determinants
[PB95-111068] p 1488 N95-19944

ANALYTIC GEOMETRY
Classical analysis methods for designing and developing downlooking radars
[AD-A285760] p 1302 N95-21405

ANALYTICAL CHEMISTRY
Time-resolved analytical methods for liquid/solid interfaces
[DE95-002255] p 1240 N95-20780

ANDROMEDA GALAXY
Far-Infrared sources and diffuse emission in M31
p 1593 N95-21761

ANGLE OF ATTACK
T-45A High Angle of Attack Testing: US Naval Test Pilot School 46th Annual Reunion and Symposium
[AD-A284000] p 1207 N95-20466
Pressure measurements on an F/A-18 twin vertical tail in buffeting flow. Volume 1: Wind tunnel test summary
[AD-A279126] p 1202 N95-21877
Effect of juncture fillets on double-delta wings undergoing sideslip at high angles of attack
[AD-A286165] p 1207 N95-22039

ANGLES (GEOMETRY)
Topography of neutron scattering from diblock copolymer film
[DE95-001457] p 1229 N95-20840

ANGULAR DISTRIBUTION
Pair production as a probe of colliding beam size
[DE95-002893] p 1536 N95-21337
Physics of correlated studies
[DE95-001204] p 1581 N95-21842
Angular and charge state distributions of highly charged ions scattered during low energy surface-channeling interactions with Au(110)
[DE95-001348] p 1525 N95-21857
Residual stress analysis in swage autofrettaged thick-walled cylinders by position-sensitive x-ray diffraction techniques
[AD-A286383] p 1388 N95-22320

ANGULAR MOMENTUM
Ion-molecular spiraling collisions and termolecular recombination
[AD-A285633] p 1517 N95-21151
The energetics and dynamics of free radicals, ions, and clusters
[DE94-018101] p 1244 N95-21701

ANGULAR RESOLUTION
An assessment of image reconstruction from balloon-borne and the IRAS data p 1592 N95-21752

ANGULAR VELOCITY
Effects of yaw and pitch motion on model attitude measurements
[NASA-TM-4641] p 1368 N95-22109

ANHYDRIDES
A direct process for preparing semi-crystalline polyimides
[NASA-CASE-LAR-15020-1] p 1268 N95-20407

ANIMALS
Compilation of 1993 annual reports of the Navy ELF Communications System Ecological Monitoring Program
[AD-A279575] p 1408 N95-21699

ANIONS
Spectroscopic studies of glass structure
[DE94-016551] p 1268 N95-20468
A new family of anion receptors and their effects on ion pair dissociation and conductivity of lithium salts in non-aqueous solutions
[DE94-016822] p 1512 N95-20477
New ET-based organic superconductors with the organometallic anion Cu(CF3)4(-)
[DE94-016904] p 1567 N95-20479
The dynamics of formation and evaporation of mixed alkali halide nanocrystals: A case of comparable lattice energies
[AD-A285052] p 1567 N95-20483
An investigation of the applicability of the new ion exchange resin, Reillex(TM)-HPQ, in ATW separations
[DE94-016576] p 1274 N95-21234
Novel fluorine oxidizers
[AD-A279480] p 1284 N95-21678

ANISOTROPY
Elastic anisotropy in hot-pressed Si3N4 composites: Role of in situ (beta)-Si3N4 grains and added (beta)-Si3N4 whiskers
[DE94-018387] p 1226 N95-20027
Mean field analysis of orientation selective grain growth driven by interface-energy anisotropy
[DE94-015797] p 1566 N95-20399
DC potential anomalies caused by a conducting body in an anisotropic conducting half-space
[PB95-127106] p 1291 N95-20775
The processing and mechanical properties of high temperature/high performance composites. Mechanism-based constitutive laws and design, book 1
[AD-A279736] p 1228 N95-20801
S-D hybridization and anisotropy of the optical second harmonic at low frequencies
[AD-A279449] p 1544 N95-20876
Anisotropic structure of homogeneous turbulence subjected to uniform rotation p 1346 N95-21059
Modelling anisotropy and backscatter effects in the subgrid scale stress tensor p 1349 N95-21077
Ultraviolet laser emission properties of Ce(3+)-doped LiSrAlF6
[DE94-016364] p 1372 N95-21135
Anisotropic transport properties of BSCCO single crystals and Ag-clad tapes in high magnetic fields
[DE95-000938] p 1575 N95-21936
Dielectric mixtures with arbitrarily anisotropic components: Focus on special gyrotropic effects
[PB95-127015] p 1311 N95-22363

ANNEALING
Enhancement of creep resistance of a sintered S3N4 ceramic by microwave annealing
[DE94-017698] p 1265 N95-20220
Electron-irradiated two-terminal, monolithic InP/Ga0.47In0.53As tandem solar cells and annealing of radiation damage p 1319 N95-20519
Radiation effects on p+n InP junctions grown by MOCVD p 1319 N95-20520
Annealing of irradiated n+p InP buried homojunctions
p 1320 N95-20524
Photoluminescence under pressure and annealing of nitrogen-doped ZnSe
[DE95-002355] p 1568 N95-20630
High performance YBCO films
[AD-A286567] p 1326 N95-20824
Defect production and recombination during low-energy ion processing
[DE95-001827] p 1572 N95-21304
Effect of annealing temperature on the texture of rolled tantalum and tantalum-10 wt % tungsten
[DE95-002702] p 1262 N95-22308

ANNIHILATION REACTIONS
D0 quantum chromodynamics: A compilation of results presented at DPF 1994
[DE95-000838] p 1510 N95-20344
High energy photon-photon collisions
[DE94-017494] p 1532 N95-20388
Evidence for t(bar t) production at the Tevatron: Statistical significance and cross section
[DE95-002524] p 1515 N95-20897
Charmonium production, b quark and B meson production and b(bar b) correlations at CDF
[DE95-002525] p 1515 N95-20898
Measuring A(sub b) with polarized beams at SLC
[DE95-002865] p 1519 N95-21248
The diphoton production rate in (bar p)p collisions at the square root of s = 1800 GeV
[DE95-000559] p 1522 N95-21497
Charge density of fractional charged quasiparticles in the composite fermion picture
[DE94-018122] p 1524 N95-21703
Uniform upper bounds in the Froehlich polaron theory
[DE94-628998] p 1525 N95-21860
Tests of structure functions using lepton pairs: W-charge asymmetry at CDF
[DE95-000560] p 1527 N95-22122
Electroweak boson pair production in p(-p) collisions at the square root of s = 1.8 TeV
[DE95-000725] p 1527 N95-22194
Inclusive B production at CDF and D0
[DE95-000728] p 1528 N95-22196

ANNOTATIONS
Utilizing artificial neural networks in network flow analysis: An annotated bibiliography
[DE95-002453] p 1482 N95-21522

ANNUAL VARIATIONS
Climatological data for clouds over the globe from surface observations, 1982-1991: The total cloud edition
[DE95-002537] p 1431 N95-22288

ANNULAR FLOW
Laser anemometry and viscous computation of the flow through an annular turbine cascade
[AD-A280070] p 1341 N95-20968

ANODES
Molten carbonate fuel cell product development test
[DE95-000005] p 1324 N95-20574
Anodic oxygen-transfer electrocatalysis at iron-doped lead dioxide electrodes
[DE95-001653] p 1242 N95-21397

ANODIZING
Aircraft corrosion study
[AD-A279527] p 1259 N95-21687

ANOMALIES
A Cost and Performance System (CAPS) in a Federal agency p 1584 N95-20746
DC potential anomalies caused by a conducting body in an anisotropic conducting half-space
[PB95-127106] p 1291 N95-20775
Anomalous vector-boson couplings in Majorana neutrino models
[PB95-127460] p 1518 N95-21220
The atmospheric neutrino anomaly in Soudan 2
[DE94-019288] p 1604 N95-21475

ANTARCTIC REGIONS
Surface exposure geochronology using cosmogenic nuclides: Applications in Antarctic glacial geology
[AD-A279392] p 1426 N95-21944
Transport, radiative, and dynamical effects of the Antarctic ozone hole: A GFDL SKYHI model experiment
[PB94-192754] p 1409 N95-22101
ANTENNA ARRAYS
A colocated magnetic loop, electric dipole array antenna (preliminary results)
[AD-A285381] p 1290 N95-20556
High contrast organic crystal optical modulator for phased array antenna and optical signal processing
[AD-A286557] p 1544 N95-20844
A method using focal plane analysis to determine the performance of reflector antennas p 1304 N95-21538
Inband scattering from arrays with series feed networks
[AD-A286209] p 1307 N95-21883
ANTENNA COUPLERS
VHDL modeling of PRC-70 radio ASICs for reverse engineering
[AD-A285740] p 1457 N95-19929
ANTENNA DESIGN
The design and analysis of a phased array microstrip antenna for a low earth orbit communication satellite
[AD-A284791] p 1289 N95-20065
Low-cost conical ultra-wideband antenna
[AD-A286569] p 1292 N95-20825
Angle diversity on digital microwave links: Antenna design and experimental results p 1297 N95-20947
Multipath impact on ground-based global positioning system range measurements: Aspects of measurement, modeling, and mitigation p 1297 N95-20949
Small antennas for communication over sea ice
[AD-D016206] p 1301 N95-21156
Design and implementation of a dual-beam printed antenna for a reception in angular diversity on a Hertzien cluster (or bundle)
[PB95-131603] p 1302 N95-21431
Analysis of a microstrip reflectarray antenna for microspacecraft applications p 1305 N95-21541
Analysis of a disk-on-rod surface wave element inside a corrugated horn using the mode-matching technique
p 1305 N95-21543
An 8-meter-long coupled cavity RFQ linac
[DE94-018077] p 1331 N95-21667
Inverse and control problems in electromagnetics
[AD-A286438] p 1310 N95-22250
ANTENNA FEEDS
A method using focal plane analysis to determine the performance of reflector antennas p 1304 N95-21538
Inband scattering from arrays with series feed networks
[AD-A286209] p 1307 N95-21883
ANTENNA RADIATION PATTERNS
Three-dimensional effects for radio frequency antenna modeling
[DE94-019125] p 1303 N95-21459
A method using focal plane analysis to determine the performance of reflector antennas p 1304 N95-21538
Measurements of the Auburn ECE optical system parameters for temperature fluctuation measurements on TEXT-U
[DE94-019217] p 1562 N95-22120
ANTENNAS
Passive surface deployed variable inductance wire antenna statement of government interest
[AD-D016210] p 1307 N95-21910
ANTHROPOMETRY
Human force exertion in user-product interaction. Backgrounds for design
[PB95-132858] p 1452 N95-21283
ANTIBODIES
Monoclonal antibodies directed against surface molecules of multicell spheroids
[NASA-CR-197367] p 1437 N95-20559
ANTIEMETICS AND ANTINAUSEANTS
Acute radiation sickness amelioration analysis
[AD-A279084] p 1445 N95-21629
ANTIFERROMAGNETISM
Neutron diffraction study of the magnetic ordering of BaCuO(2+x)
[DE95-001357] p 1572 N95-21297
ANTIMONIDES
Sputter deposition of multilayer thermoelectric films: An approach to the fabrication of two-dimensional quantum wells
[DE95-002396] p 1272 N95-20892
ANTIMONY
Synthesis and structure of a novel bis-stibole
[AD-A286345] p 1224 N95-22252
ANTIMONY COMPOUNDS
InTISb for long-wavelength infrared photodetectors and arrays
[AD-A280109] p 1331 N95-21660
ANTINEUTRINOS
The solar flux of thermal neutrinos and antineutrinos of all flavors
[DE95-003204] p 1604 N95-22085
ANTIPROTONS
Strange particle and antiproton production in S + nucleus collisions at 200 GeV/nucleon
[DE95-002348] p 1513 N95-20575
Search for new particles decaying to dijets in p(bar p) collisions at (radical)s = 1.8 TeV
[DE94-018994] p 1523 N95-21563
ANTIRADIATION DRUGS
Acute radiation sickness amelioration analysis
[AD-A279084] p 1445 N95-21629
ANTISEPTICS
Disinfection of purified waste water with ultra violet light on a technical scale
[PB95-131926] p 1405 N95-21330
APERTURES
Detection optimization using linear systems analysis of a coded aperture laser sensor system
[DE95-001112] p 1371 N95-20832
Plasma Electrode Pockels Cells for the Beamlet and NIF lasers
[DE94-016541] p 1557 N95-21166
Analytic models for beam propagation and far-field patterns in slab and bow-tie x ray lasers
[DE94-016607] p 1372 N95-21173
Comparison of calculated with measured dynamic aperture
[DE95-002863] p 1534 N95-21246
Sources of amplitude-dependent tune shift in the PEP-2 design and their compensation with octupoles
[DE94-018198] p 1519 N95-21262
Synthetic aperture radar processing with polar formatted subapertures
[DE95-001830] p 1302 N95-21305
Analysis of a microstrip reflectarray antenna for microspacecraft applications p 1305 N95-21541
APEXES
Graphs cospectral with distance-regular graphs
[PB95-111050] p 1488 N95-19943
Factorization in closed string field theory
[PB95-133542] p 1580 N95-21030
Vertex ranking for permutation and other graphs
[PB95-127569] p 1496 N95-22327
APOLLO SPACECRAFT
Moon: Old and new
[NASA-TM-110511] p 1601 N95-21196
APPLICATION SPECIFIC INTEGRATED CIRCUITS
VHDL modeling of PRC-70 radio ASICs for reverse engineering
[AD-A285740] p 1457 N95-19929
The design and manufacturing development of an active silicon substrate MCM p 1211 N95-20645
Design and development SAWAFE peak detector chip
[DE95-001745] p 1332 N95-21742
APPLICATIONS OF MATHEMATICS
Computing methods for the approximate solution of time dependent problems
[AD-A286007] p 1491 N95-20719
Error analysis of the quadratic nodal expansion method in slab geometry
[DE95-001352] p 1492 N95-21285
Method and apparatus for classifying targets
[AD-D016519] p 1303 N95-21464
Foundations of functional programming: A programmer's point of view
[PB95-132932] p 1471 N95-22094
APPLICATIONS PROGRAMS (COMPUTERS)
Introduction to the FIRE engine: A C++ toolkit for Finite automata and Regular Expressions
[PB95-110599] p 1456 N95-19891
Hierarchical diagrammatic representation of class structure
[PB95-110722] p 1456 N95-19908
Computer program for calculation of complex chemical equilibrium compositions and applications. Part 1: Analysis
[NASA-RP-1311] p 1235 N95-20180
Evaluation of Borland Turbo Vision
[AD-A279873] p 1459 N95-20184
A new tool for accelerator system modeling and analysis
[DE94-018292] p 1531 N95-20203
RCS calculation capability
[AD-A286329] p 1289 N95-20211
BACKSCAT lidar simulation version 4.0: Technical documentation and users guide
[AD-A285851] p 1290 N95-20376
Muon data analysis program RUMDA
[PB95-129839] p 1511 N95-20434
Fault-tolerance in distributed and multiprocessor real-time systems
[AD-A279896] p 1461 N95-20595
Software for flow distribution in electronic rack structures
[AD-A285994] p 1325 N95-20715
EPSCoR supplemental grant for an application of neural networks to seismic signal discrimination
[AD-A285846] p 1414 N95-20878
COYOTE II: A finite element computer program for nonlinear heat conduction problems. Part 1: Theoretical background
[DE95-002587] p 1463 N95-20887
Statistical analysis of Turbine Engine Diagnostic (TED) field test data
[AD-A286032] p 1379 N95-20998
A computer code (SKINTEMP) for predicting transient missile and aircraft heat transfer characteristics
[AD-A286044] p 1341 N95-21001
VLUGr3: A vectorizable adaptive grid solver for PDEs in 3D. 2: Code description
[PB95-135737] p 1465 N95-21033
Investigation of shear layer transition using various turbulence models p 1352 N95-21096
Effects of battery technologies, driving patterns, and climate comfort control on the performance of electric vehicles
[DE95-001102] p 1329 N95-21296
SEEK: A FORTRAN optimization program using a feasible directions gradient search
[NASA-CR-4641] p 1380 N95-21359
Operator's manual for the multistation offgas analysis system
[DE95-002060] p 1243 N95-21472
PVM 3 beyond network computing
[DE94-019115] p 1477 N95-21556
The molecular mechanics program DUPLEX: Computing structures of carcinogen modified DNA by surveying the potential energy surface
[DE94-019153] p 1439 N95-21606
Application-oriented architecture for multimedia teleservices
[PB95-135513] p 1306 N95-21623
DOS basics
[DE94-018434] p 1455 N95-21632
The application of a statistical analysis software package to explosive testing
[MRL-TR-93-42] p 1284 N95-21658
Modeling of rolling element bearing mechanics. Computer program user's manual
[NASA-CR-196557] p 1381 N95-21692
Modeling of rolling element bearing mechanics. Theoretical manual
[NASA-CR-196556] p 1381 N95-21705
A user's guide to LUGSAN 1.1: A computer program to calculate and archive lug and sway brace loads for aircraft-carried stores
[DE95-001919] p 1207 N95-21730
EAGLES 1.1: A microcomputer software package for analyzing fuel efficiency of electric and gasoline vehicles
[DE95-001119] p 1469 N95-21829
State of the art in CFD pre- and postprocessing
[PB95-110391] p 1356 N95-22017
Modelling multimedia teleservices with OSI upper layers framework: Short paper
[PB95-132734] p 1308 N95-22080
Users guide to NCEMSS, version 2.0
[DE95-003443] p 1548 N95-22238
Sandia National Laboratories analysis code data base
[DE95-004188] p 1502 N95-22420
APPROACH
A real-time algorithm for integrating differential satellite and inertial navigation information during helicopter approach
[NASA-CR-197409] p 1205 N95-21891
APPROACH CONTROL
Crew aiding and automation: A system concept for terminal area operations, and guidelines for automation design
[NASA-CR-4631] p 1204 N95-19950
APPROACH INDICATORS
Minima reduction simulation test results
[AD-A285626] p 1204 N95-21148
APPROXIMATION
Sharp determinants
[PB95-111068] p 1488 N95-19944
Finite dimensional approximation of a class of constrained nonlinear optimal control problems
[NASA-CR-194891] p 1479 N95-20010
Computing methods for the approximate solution of time dependent problems
[AD-A286007] p 1491 N95-20719
Computing near-optimal schedules
[PB95-132072] p 1466 N95-21269
Diffusion approximations in communication and stochastic theory
[AD-A286440] p 1302 N95-21438

Approximation algorithms for the general and the asymmetric stacker-crane problems [PB95-132098] p 1493 N95-21468

Analysis of a local defect correction approach on composite grids [PB95-135455] p 1493 N95-21574

Electronic structure and energies of alkaline earth oxides: MgO, CaO and SrO [DE94-628990] p 1575 N95-21853

Electronic structure and relative stability of icosahedral superatoms in Al-transition-metal alloys [DE94-628996] p 1260 N95-21855

Second order approximation for optical polaron in the strong coupling case [DE94-628997] p 1525 N95-21856

Single particle measurements and two particle interferometry results from CERN experiment NA44 [DE95-003041] p 1527 N95-22078

Mathematical theory of neural networks [AD-A286508] p 1465 N95-22213

AQUATIC PLANTS

Aquatic plant control research program. Ecological assessment of Kirk Pond [AD-A279090] p 1409 N95-21914

AQUEOUS SOLUTIONS

Direct catalytic decomposition of nitric oxide [DE94-018840] p 1233 N95-20045

Safe conditions for contacting nitric acid or nitrates with Tri-n-Butyl Phosphate (TBP) [DE95-001243] p 1235 N95-20215

Tests of dielectric model descriptions of chemical charge displacements in water [DE94-007530] p 1236 N95-20277

Actinide(IV) and actinide(VI) carbonate speciation studies by PAS and NMR spectroscopies [DE94-016957] p 1236 N95-20361

Theoretical and experimental study of mixed solvent electrolytes [DE94-017605] p 1237 N95-20384

Catalyzed reduction of nitrate in aqueous solutions [DE94-017660] p 1247 N95-22049

AQUIFERS

Degradation of aromatic hydrocarbons in an aquifer during a field experiment demonstrating the feasibility of remediation by natural attenuation [AD-A283809] p 1282 N95-19922

ARC HEATING

Dual active surface heat flux gage probe [NASA-TM-106861] p 1366 N95-21391

ARC MELTING

Plasma arc melting of titanium-tantalum alloys [DE94-016291] p 1252 N95-20331

Plasma arc melting of a 80 weight percent tantalum -20 weight percent titanium alloy [DE95-000846] p 1260 N95-22006

The influence of chemistry and microstructure on the fracture toughness of V-V3Si in-situ composites [DE94-018997] p 1232 N95-22126

ARC WELDING

The origin of acicular ferrite in gas metal arc and submerged arc welds [AD-A286129] p 1377 N95-19984

Fusion welding of advanced borated stainless steels [DE94-019037] p 1378 N95-20053

ARCHITECTURE

Generic architecture for knowledge-based control of processes in dynamic environments [PB95-132676] p 1483 N95-21981

ARCHITECTURE (COMPUTERS)

High-performance packet switching architecture for ATM: Conventional solution and neural network solution [PB95-110920] p 1312 N95-19935

Hindered settling computations using a parallel boundary element method [DE94-014286] p 1339 N95-20137

Preliminary evaluation of a digital optical systolic processor implemented with acousto-optic cells [AD-A286377] p 1541 N95-20231

Kernel mucking in top [DE94-017077] p 1460 N95-20385

System design document U-AVLIS control system architecture [DE94-017297] p 1460 N95-20387

RALPAR-RAL mesh partitioning program version 1.1 [PB95-129847] p 1475 N95-20435

Research in theoretical elementary particle physics at the University of Florida, task A [DE94-004373] p 1512 N95-20469

Downsizing information systems: Framing the issues for the Office of Naval Intelligence (ONI) [AD-A279888] p 1588 N95-20589

Fault-tolerance in distributed and multiprocessor real-time systems [AD-A279896] p 1461 N95-20595

Methods and components for optical contention resolution in high speed networks [AD-A280016] p 1543 N95-20598

The impact of advanced packaging technology on modular avionics architectures p 1208 N95-20632

Standard Hardware Acquisition and Reliability Program (SHARP) advanced SEM-E packaging p 1208 N95-20633

The IEEE scalable coherent interface: An approach for a unified avionics network p 1212 N95-20650

Optical backplane for modular avionics p 1212 N95-20652

High performance backplane components for modular avionics p 1212 N95-20653

An integrated architecture of adaptive neural network control for dynamic systems [DE94-014813] p 1481 N95-20693

A new process for acquiring software architecture [AD-A286012] p 1462 N95-20721

Environment for Test and Analysis of Distributed Software (ETADS) [AD-A285776] p 1463 N95-20877

Functional and para-functional parallel processing [DE95-002805] p 1475 N95-20888

Real-time reconfiguration study [AD-A286060] p 1464 N95-20910

The opportunities for and challenges of common integrated electronics [AD-A279991] p 1327 N95-20966

Preliminary study of HUTSAT microsatellite [PB95-127619] p 1220 N95-21026

Heterogeneous multi-robot cooperation [AD-A279839] p 1481 N95-21185

An object-oriented implementation of the Xpress transfor protocol [DE95-001506] p 1301 N95-21277

Quantitative evaluation of wrist posture and typing performance: A comparative study of 4 computer keyboards [DE95-002392] p 1452 N95-21358

PVM 3 beyond network computing [DE94-019115] p 1477 N95-21556

PVM a platform for portable distributed computing [DE94-019156] p 1455 N95-21607

Application-oriented architecture for multimedia teleservices [PB95-135513] p 1306 N95-21623

Top ten list of user-hostile interface design [DE95-001602] p 1453 N95-21721

High-capacity optical multichannel virtual mesh interconnection networks [PB95-134094] p 1546 N95-21870

Generic architecture for knowledge-based control of processes in dynamic environments [PB95-132676] p 1483 N95-21981

Information Management Architecture for an Integrated Computing Environment for the Environmental Restoration Program. Volume 2: Interim business systems guidance [DE95-001385] p 1591 N95-22061

Modelling multimedia teleservices with OSI upper layers framework: Short paper [PB95-132734] p 1308 N95-22080

Scalable programming environment [AD-A286390] p 1472 N95-22201

Design of a massively parallel computer using bit serial processing elements [NASA-CR-197365] p 1479 N95-22406

TDX: A high-bandwidth crossbar-switched communication paradigm [DE94-017187] p 1311 N95-22407

ARCTIC REGIONS

Atlas of SSM/I satellite ice concentration interpolated to operational ice model domains of the Arctic for 1993 [AD-A280183] p 1432 N95-20012

Propagation measurements on a troposcatter link in the Canadian High Arctic p 1295 N95-20940

Cold regions instrumentation considerations [AD-A279492] p 1367 N95-21680

AREA NAVIGATION

Crew aiding and automation: A system concept for terminal area operations, and guidelines for automation design [NASA-CR-4631] p 1204 N95-19950

ARGON

Helium exhaust studies in the D3-D tokamak [DE94-016682] p 1552 N95-20334

X-ray spectroscopy of xenon [DE95-002132] p 1240 N95-20865

Aging tests of ethylene contaminated argon/ethane [DE95-002526] p 1282 N95-20899

Recent photoabsorption measurements in the rare gases and alkalis in the 3 to 15 keV photon energy region [DE94-019278] p 1521 N95-21406

Experimental study of interactions of highly charged ions with atoms at keV energies [DE95-001807] p 1521 N95-21441

Ion charge-state production and photoionization near the K edge in argon and potassium [DE95-001443] p 1522 N95-21502

Experimental study of interactions of highly charged ions with atoms at keV energies [DE94-018648] p 1529 N95-22316

ARGON ISOTOPES

The ratios of carbon and non-radiogenic helium and argon isotopes in the mantle and crustal rocks p 1421 N95-21805

ARITHMETIC

Packaging the MAMA module p 1209 N95-20639

ARMED FORCES (FOREIGN)

Psychosocial stress and mental health in a forward-deployed military community [AD-A285940] p 1451 N95-22323

ARMED FORCES (UNITED STATES)

Bomber force 2000: Operational concepts for long-range combat aircraft [AD-A279378] p 1206 N95-20181

Assessing post traumatic stress disorder and PTSD symptomatology in US Army personnel [AD-A285941] p 1451 N95-22324

ARMOR

ALT-2 armor tile design for upgraded TEXTOR operation [DE94-015749] p 1549 N95-20143

Tungsten-uranium penetrator target interaction [DE95-000847] p 1387 N95-21364

AROMATIC COMPOUNDS

Restricted mass transport effects on free radical reactions [DE94-018136] p 1217 N95-21706

ARPA COMPUTER NETWORK

Advanced Standard Electronic Modules format-E (SEM-E) processes for rapid prototyping p 1210 N95-20642

ARRAYS

Signal-to-noise gain from adaptive matched-field beamforming of multidimensional acoustic arrays [AD-A285671] p 1503 N95-20084

Investigating the resolution of resistivity arrays using inverse theory [DE94-017760] p 1412 N95-20287

A new mini Ball Grid Array (mBGA) multichip module technology [DE94-018897] p 1480 N95-20342

Field-emitter arrays for RF vacuum microelectronics [AD-A279959] p 1325 N95-20661

InTISb for long-wavelength infrared photodetectors and arrays [AD-A280108] p 1332 N95-21774

Order and turbulence in RF-driven Josephson junction series arrays [DE94-629076] p 1576 N95-21997

ARTIFACTS

Incremental rederivation of software artifacts: FY 1993 [AD-A285790] p 1473 N95-22402

ARTIFICIAL INTELLIGENCE

Intelligent tutoring systems: Past, present, and future [AD-A280011] p 1448 N95-19970

Collected papers of the Soar/IFOR project, Spring 1994 [AD-A280063] p 1216 N95-20624

Automatic generation of fuzzy rules for the sensor-based navigation of a mobile robot [DE95-001428] p 1481 N95-20837

Heterogeneous multi-robot cooperation [AD-A279839] p 1481 N95-21185

13th European Annual Conference on Human Decision Making and Manual Control [PB95-132874] p 1450 N95-21284

Communications and control for electric power systems: Power system stability applications of artificial neural networks [NASA-CR-197594] p 1483 N95-21613

Adaptive capture of expert behavior [DE94-018285] p 1483 N95-21710

Intelligent interactive project management system [PB95-132684] p 1586 N95-21982

Artificial neural network metamodels of stochastic computer simulations [AD-A285951] p 1484 N95-22056

Discovering related DNA sequences via mutual information [DE95-001101] p 1440 N95-22067

Activities of the Research Institute for Advanced Computer Science [NASA-CR-197291] p 1478 N95-22108

Communications and control for electric power systems: Power system stability applications of artificial neural networks [NASA-CR-197333] p 1484 N95-22171

Mathematical theory of neural networks
[AD-A286508] p 1485 N95-22213
Artificial Intelligence (AI) and Ada: Integrating AI with mainstream software engineering
[AD-A286093] p 1485 N95-22226
Logic programming and negation: A survey
[PB95-110730] p 1472 N95-22302
Simulation of structural response using a recurrent radial basis function network
[DE94-017342] p 1486 N95-22409

ARTIFICIAL SATELLITES
Ice Processing System software support documentation
[AD-A280030] p 1388 N95-20006
Angle resolved Auger electron spectroscopy: An alternate tool for identifying electronic excitation processes in solids
[AD-A285375] p 1238 N95-20555
Space fundamentals for the war fighter
[AD-A279703] p 1217 N95-20690

ASIA
Energy and environmental issues and international opperation in Asia
[DE94-796596] p 1404 N95-21143

ASPECT RATIO
Numerical analysis of energetic particle stabilization of ballooning modes in finite-aspect-ratio tokamaks
[DE94-631397] p 1556 N95-21164

ASSAYING
Monoclonal antibodies directed against surface molecules of multicell spheroids
[NASA-CR-197367] p 1437 N95-20559

ASSEMBLIES
Phase E in a water-saturated peridotite system at 9.3 GPa p 1420 N95-21799

ASSESSMENTS
Environmental Hazards Assessment Program
[DE94-019075] p 1406 N95-21565

ASSIMILATION
Real time system for practical acoustic monitoring of global ocean temperature
[AD-A286435] p 1436 N95-22209

ASTEROIDS
Experimental hypervelocity impact effects on simulated planetesimal materials
[DE94-017290] p 1599 N95-20144
Erice International Seminars on Planetary Emergencies. 17th Workshop: The Collision of an Asteroid or Comet with the Earth
[AD-A280122] p 1600 N95-21577

ASTRONAUT LOCOMOTION
STS Flight 64 mission highlights
[NASA-TM-110515] p 1219 N95-22295

ASTRONAUTS
Challenger's night flight
[NASA-TM-110503] p 1217 N95-19995

ASTRONOMICAL MAPS
Hires and beyond p 1592 N95-21750
An assessment of image reconstruction from balloon-borne and the IRAS data p 1592 N95-21752
Far-infrared mapping of dusty elliptical galaxies
p 1593 N95-21763

ASTRONOMICAL MODELS
Predictions from quantum cosmology
[PB95-111126] p 1599 N95-20173
The solar neutrino problem: Neither astrophysics nor oscillations?
[DE94-012850] p 1603 N95-21316
The ORNL Neutron-Capture Cross Section Facility
[DE94-019146] p 1537 N95-21460
In search of random noise p 1592 N95-21753

ASTRONOMICAL SATELLITES
Low noise 22 GHz receiver for the radioastron satellite, part 2: Space qualification tests
[PB95-127197] p 1598 N95-22376

ASTROPHYSICS
Connection with dynamics: General introduction
[NASA-CR-197617] p 1579 N95-19947
Overview of the Institute of Geophysics and Planetary Physics and Lawrence Livermore National Laboratory collaborative efforts
[DE94-017300] p 1599 N95-20145
Israel Physical Society Annual Meeting 1994
[DE94-630140] p 1565 N95-20261
Resonant photon-graviton conversion in EM fields: From earth to heaven
[DE95-002784] p 1301 N95-21241
The solar neutrino problem: Neither astrophysics nor oscillations?
[DE94-012850] p 1603 N95-21316
The ORNL Neutron-Capture Cross Section Facility
[DE94-019146] p 1537 N95-21460
Solar wind composition
[NASA-TM-197364] p 1604 N95-22384

ASYMMETRY
Measuring A(sub b) with polarized beams at SLC
[DE95-002865] p 1519 N95-21248
Magnetic x-ray circular dichroism in spin-polarized photoelectron diffraction
[DE95-002394] p 1520 N95-21360
Approximation algorithms for the general and the asymmetric stacker-crane problems
[PB95-132098] p 1493 N95-21468
Tests of structure functions using lepton pairs: W-charge asymmetry at CDF
[DE95-000560] p 1527 N95-22122
Large-eddy simulation of flow through a plane, asymmetric diffuser p 1360 N95-22449

ASYMPTOTIC GIANT BRANCH STARS
HIRAS images of fossil dust shells around AGB stars
p 1593 N95-21768

ASYMPTOTIC METHODS
Growth series for the commutator subgroup
[PB95-111092] p 1490 N95-20452
Triple flame structure and diffusion flame stabilization
p 1249 N95-21039
Diffusion approximations in communication and stochastic theory
[AD-A286440] p 1302 N95-21438
Rigorous spin-spin correlation function of Ising model on a special kind of Sierpinski Carpets
[DE94-628995] p 1575 N95-21854
An asymptotic solution of the (infinity)-d Hubbard model
[DE94-629042] p 1582 N95-21994

ASYMPTOTIC PROPERTIES
Optimal distributed control system for a linear distributed parameter system
[AD-D016583] p 1480 N95-20202
Exponential deconvolution: Two asymptotically equivalent estimators
[PB95-132122] p 1499 N95-21469

ASYMPTOTIC SERIES
Asymptotic analysis of Nash equilibria in nonzero-sum linear-quadratic differential games. The two-player case
[PB95-111027] p 1499 N95-19941
Preconditioning via asymptotically-defined domain decomposition
[DE94-019046] p 1493 N95-21564

ATMOSPHERIC ATTENUATION
Applicability of the ECMWF rain height and rainfall rate data to the prediction of low-availability rain attenuation in Europe
[PB95-127684] p 1430 N95-21413
Passive millimetre wave imaging: A review
[AD-A279275] p 1303 N95-21491
Evaluation of simple spherical spreading model for near vertical acoustical propagation
[AD-A286284] p 1505 N95-22042

ATMOSPHERIC BOUNDARY LAYER
Front-boundary layer models from STORM-FEST observations
[AD-A279907] p 1428 N95-20186
Boundary layer cloud studies in support of ASTEX
[AD-A285947] p 1429 N95-20395
Real-data tests of a single-Doppler radar assimilation system
[AD-A286638] p 1292 N95-20904
High resolution properties of the equatorial Pacific marine atmospheric boundary layer from lidar and radiosonde observations
[DE95-001028] p 1426 N95-21875
SAR-related stress variability in the Marine Atmospheric Boundary Layer (MABL)
[AD-A286462] p 1431 N95-22393

ATMOSPHERIC CHEMISTRY
An overview of the Evaluation of Oxygen Interactions with Materials 3 Experiment: Space Shuttle Mission 46; July-August, 1992
[NASA-TM-110129] p 1412 N95-20278
Explicit methods for stiff ODEs from atmospheric Chemistry
[PB95-135794] p 1404 N95-21034
An Echelle Grating Spectrometer (EGS) for mid-IR remote chemical detection
[DE94-019310] p 1367 N95-21478
Is xenon eldest? p 1425 N95-21823
Assessment of the atmospheric hazards and risks of new chemicals: Procedures to estimate hazard potentials
[PB95-107488] p 1410 N95-22186
Proceedings: International Symposium on Global Change (IGBP)
[DE94-765351] p 1410 N95-22219

ATMOSPHERIC CIRCULATION
Simulation of stellar speckle imaging
[DE94-016606] p 1412 N95-19985
The vertical distribution of heating in the tropical atmosphere
[AD-A285934] p 1429 N95-20391
Program control on the Tropical Rainfall Measuring Mission p 1584 N95-20750
A study of westerly wind bursts preceding the 1991-1992 El Nino
[AD-A286570] p 1429 N95-20826
Two-micron Laser Atmospheric Wind Sounder (LAWS) pointing/tracking study
[NASA-CR-195012] p 1220 N95-21190
Stability effects on the profiles of vertical velocity and its variance in katabatic flow
[DE95-001126] p 1426 N95-21836
High resolution properties of the equatorial Pacific marine atmospheric boundary layer from lidar and radiosonde observations
[DE95-001028] p 1426 N95-21875
DOD science and engineering apprenticeship program for high school students
[AD-A280371] p 1583 N95-22100
Confirmatory analysis of SAGE-1, and -2 data
[DE95-003623] p 1427 N95-22240
Climatological data for clouds over the globe from surface observations, 1982-1991: The total cloud edition
[DE95-002537] p 1431 N95-22288

ATMOSPHERIC COMPOSITION
Radiative forcing for changes in tropospheric O3
[DE94-019017] p 1413 N95-20354
Radiative forcing calculations for CH3Cl
[DE94-019018] p 1402 N95-20355
The development and evaluation of water-mist fire extinguishing systems
[DE94-019019] p 1286 N95-20356
Studies of the gas tori of Titan and Triton
[NASA-CR-197377] p 1601 N95-20797
Closure on the global carbon cycle
[DE94-018617] p 1404 N95-20991
ICE BABY: Measurements of concentration fluctuations in a forest area in winter conditions
[PB95-133468] p 1405 N95-21274
Definition report on environmental indices in future environmental assessments environmental balance/environmental outlook
[PB95-131876] p 1405 N95-21350
Implications of noble gases in a recently recognized Martian meteorite (ALH84001) for the degassing history of Mars p 1424 N95-21819
He, Xe and Ne isotopes in a steady-state mass transport model and implications about terrestrial volatiles
p 1425 N95-21821
Is xenon eldest? p 1425 N95-21823

ATMOSPHERIC CORRECTION
A comparative survey of current and proposed tropospheric refraction-delay models for DSN radio metric data calibration
[NASA-CR-197338] p 1412 N95-20002

ATMOSPHERIC DENSITY
Electronic structure and energies of alkaline earth oxides: MgO, CaO and SrO
[DE94-628990] p 1575 N95-21853

ATMOSPHERIC DIFFUSION
Study of the fast and slow variations of the power received at VHF links by tropospheric diffusion
p 1293 N95-20929

ATMOSPHERIC EFFECTS
Analysis of mesospheric winds and waves
[AD-A279956] p 1414 N95-20591
Methods for evaluating the effects of conduits at the surface of the sea p 1294 N95-20932
Combined effects of atmosphere and terrain on UHF/microwave paths p 1295 N95-20935
Electric and Hybrid Vehicle Program Site Operator Program
[DE95-002042] p 1333 N95-21960

ATMOSPHERIC ENTRY
Plasma chemistry of vibrationally nonequilibrium molecules
[AD-A279630] p 1553 N95-20411
Simulated rarefied entry of the Galileo probe into the atmosphere of Jupiter
[NASA-TM-110507] p 1601 N95-21621
Grid resolution and solution convergence for Mars Pathfinder forebody
[NASA-TM-109173] p 1494 N95-21622

ATMOSPHERIC GENERAL CIRCULATION MODELS
Completion of spectral rotating shadowband radiometers and analysis of ARM spectral short-wave data
[DE95-000602] p 1412 N95-20116
Monsoons: AMIP simulations of the 1987 and 1988 drought and flood regimes
[DE94-014789] p 1428 N95-20140
A control volume method on an icosahedral grid for numerical integration of the shallow-water equations on the sphere
[DE94-016345] p 1489 N95-20170

Sensitivity of climate models: Comparison of simulated and observed patterns for past climates
[DE95-002257] p 1406 N95-21379
Transport, radiative, and dynamical effects of the Antarctic ozone hole: A GFDL SKYHI model experiment
[PB94-192754] p 1409 N95-22101
Confirmatory analysis of SAGE-1, and -2 data
[DE95-003623] p 1427 N95-22240

ATMOSPHERIC HEATING
Modeling the response of the California Current system to Global Greenhouse Warming
[DE94-018253] p 1408 N95-21708

ATMOSPHERIC MODELS
Front-boundary layer models from STORM-FEST observations
[AD-A279907] p 1428 N95-20186
Radiative forcing for changes in tropospheric O3
[DE94-019017] p 1413 N95-20354
Synthesizing the Gulf Stream thermal structure from XBT data
[AD-A279665] p 1433 N95-20458
Explicit methods for stiff ODEs from atmospheric Chemistry
[PB95-135794] p 1404 N95-21034
Global ionospheric weather
[AD-A285520] p 1430 N95-21177
An integrated cloud observation and modeling investigation in support of the ARM Program
[DE95-002798] p 1430 N95-21527
Remote-sensing based technique to account for sub-grid scale variability of land surface properties
[NASA-TM-110501] p 1390 N95-22110
The applicability of neural networks to ionospheric modeling in support of relocatable Over-the-Horizon radar
[AD-A286114] p 1309 N95-22230
Substorm theories: United they stand, divided they fall
[NASA-CR-197672] p 1427 N95-22326
Modeling of collision induced absorption spectra of CO2-CO2 pairs for planetary atmosphere of Venus
[NASA-CR-197373] p 1601 N95-22338

ATMOSPHERIC MOISTURE
Daytime Raman lidar profiling of atmospheric water vapor
[DE94-015747] p 1413 N95-20397
Methods for evaluating the effects of conduits at the surface of the sea p 1294 N95-20932
Lidar technologies for airborne and space-based applications
[DE95-002954] p 1302 N95-21448
Unified very low stratus cloud/subcloud microphysics model: User's guide
[AD-A286454] p 1430 N95-21586
Response of the B-1B air data sensor to simulated dust cloud environments
[AD-A286134] p 1213 N95-22036

ATMOSPHERIC PHYSICS
The effect of regional-scale soil-moisture deficits on mesoscale atmospheric dynamics that influence fire severity
[DE95-002682] p 1413 N95-20455
Metallic ions and atoms in the upper atmosphere
[AD-A285229] p 1414 N95-20498
Ultraviolet emission from rocket motor plumes
[DSTO-TR-0002] p 1222 N95-21661
Modeling of collision induced absorption spectra of CO2-CO2 pairs for planetary atmosphere of Venus
[NASA-CR-197373] p 1601 N95-22338
The effects of magnetic storm phases on F-layer irregularities from auroral to equatorial latitudes
[AD-A286173] p 1427 N95-22423

ATMOSPHERIC PRESSURE
Effect of atmospheric pressure on measured aircraft noise levels
[PB95-130423] p 1207 N95-21425

ATMOSPHERIC RADIATION
Site Scientific Mission Plan for the Southern Great Plains CART site, July - December 1994
[DE94-017289] p 1401 N95-20193
Effects of microphysics and radiation on mesoscale processes of a midlatitude squall line
[DE94-014732] p 1429 N95-20381
The atmospheric neutrino anomaly in Soudan 2
[DE94-019288] p 1604 N95-21475

ATMOSPHERIC REFRACTION
Combined effects of atmosphere and terrain on UHF/microwave paths p 1295 N95-20935

ATMOSPHERIC SOUNDING
Noise model of the MSX SPIRIT 3 interferometer
[AD-A285837] p 1364 N95-20036
Boundary layer cloud studies in support of ASTEX
[AD-A285947] p 1429 N95-20395
Sounder calibration with backscattering from Losquet Island in the presence of multipaths
p 1300 N95-20961
Two-micron Laser Atmospheric Wind Sounder (LAWS) pointing/tracking study
[NASA-CR-195012] p 1220 N95-21190

ATMOSPHERIC TEMPERATURE
Meso-scale cooling effects of high albedo surfaces: Analysis of meteorological data from White Sands National Monument and White Sands Missile Range
[DE94-018535] p 1429 N95-20782
Sensitivity of climate models: Comparison of simulated and observed patterns for past climates
[DE95-002257] p 1406 N95-21379
Transport, radiative, and dynamical effects of the Antarctic ozone hole: A GFDL SKYHI model experiment
[PB94-192754] p 1409 N95-22101

ATMOSPHERIC TIDES
Analysis of mesospheric winds and waves
[AD-A279956] p 1414 N95-20591

ATMOSPHERIC TURBULENCE
Simulation of stellar speckle imaging
[DE94-016606] p 1412 N95-19985
Simulation of the impact of atmospheric turbulences on millimeter-wave communications systems
p 1295 N95-20939
Stability effects on the profiles of vertical velocity and its variance in katabatic flow
[DE95-001126] p 1426 N95-21836
Threshold detection in the presence of atmospheric turbulence
[AD-A286175] p 1427 N95-22249

ATOLLS
A modal analysis of currents in a Pacific Atoll lagoon
[AD-A283721] p 1431 N95-19971

ATOMIC BEAMS
Time of flight spectroscopy with muonic hydrogen
[DE94-017056] p 1245 N95-21845
Atomic velocity distributions in a hydrogen beam effusing out of an RF discharge dissociator
[AD-A279253] p 1307 N95-21985
Gas-dynamic trap diagnostic complex for study on plasma heating and power atomic beam injection
[DE94-633377] p 1529 N95-22283

ATOMIC CLUSTERS
Pairing on small clusters in the Peierls-Hubbard model: Implications for C60
[DE94-016284] p 1565 N95-20330
Consequences of oscillatory potentials and angular forces in transition metals and their aluminides
[DE94-019127] p 1258 N95-21600

ATOMIC COLLISIONS
Electron-positron pair production in ultrarelativistic atomic collisions: 6.4 TeV S(sup 16+) with Au, Pd and Al
[DE95-000690] p 1508 N95-20133
Convergent Close-Coupling method for calculation of electron scattering on hydrogen-like targets
[DE94-631340] p 1508 N95-20196
Calculation of the total and total ionization cross sections for positron scattering on atomic hydrogen
[DE94-631341] p 1508 N95-20197
The (e,2e) calculations with the final-state boundary condition
[DE94-631342] p 1509 N95-20198
Strange particle and antiproton production in S + nucleus collisions at 200 GeV/nucleon
[DE95-002348] p 1513 N95-20575
Temporal rearrangement of electronic densities in slow atomic collisions
[AD-A279725] p 1516 N95-20994
Recombination, ion-molecule collisions and (laser assisted) electron-excited atom collisions
[AD-A285604] p 1517 N95-21216
Measurements of scattering processes in negative ion: Atom collisions
[DE95-000664] p 1519 N95-21276
Experimental study of interactions of highly charged ions with atoms at keV energies
[DE95-001807] p 1521 N95-21441
The two-electron problem and prospects for atomic collision theory on a numerical lattice
[DE94-017856] p 1528 N95-22265
Experimental study of interactions of highly charged ions with atoms at keV energies
[DE94-018648] p 1529 N95-22316

ATOMIC ENERGY LEVELS
Investigation of laser-induced retinal damage: Wavelength and pulsewidth dependent mechanisms
[AD-A286066] p 1443 N95-20848
Photophysical processes on triplet states and radical ions in pure and molecularly doped polymers
[DE95-002681] p 1570 N95-20916
Auger spectrometry of atoms and molecules
[DE94-018052] p 1524 N95-21664
The solar flux of thermal neutrinos and antineutrinos of all flavors
[DE95-003204] p 1604 N95-22085

ATOMIC EXCITATIONS
Temporal and spectral investigation of multi-Landau level quantum beats in GaAs
[DE94-018189] p 1569 N95-20678
Magnetron power supply at high stability and its application in plasma excitation for the production of ultraviolet radiation
[DE94-629656] p 1326 N95-20733
Electric-field effects on shallow donor impurity in a harmonic quantum dot
[DE94-629034] p 1577 N95-22176
Temperature dependence of a magnetopolaron in a harmonic quantum dot in resonant magnetic fields
[DE94-629036] p 1502 N95-22177
The doping effect on spin-Peierls instability
[DE94-629046] p 1577 N95-22178
Interference of fluorescence x rays and coherent excitation of core levels
[DE94-016809] p 1527 N95-22188

ATOMIC FORCE MICROSCOPY
Gordon Research Conference on Physical Electrochemistry
[AD-A286545] p 1240 N95-20842

ATOMIC INTERACTIONS
A multisite interaction expansion of the total energy in metals
[DE94-017175] p 1262 N95-22313
Experimental study of interactions of highly charged ions with atoms at keV energies
[DE94-018648] p 1529 N95-22316

ATOMIC PHYSICS
Research in the chemical sciences: Summaries of FY 1994
[DE94-015427] p 1223 N95-20264
Temporal rearrangement of electronic densities in slow atomic collisions
[AD-A279725] p 1516 N95-20994
Theoretical atomic physics for fusion
[DE94-019196] p 1524 N95-21605
Atomic processes in processing plasmas
[DE94-019177] p 1560 N95-21609
Auger spectrometry of atoms and molecules
[DE94-018052] p 1524 N95-21664
Formal specification and compositional verification of an atomic broadcast protocol
[PB95-110508] p 1472 N95-22351

ATOMIC SPECTRA
Auger spectrometry of atoms and molecules
[DE94-018052] p 1524 N95-21664

ATOMIC STRUCTURE
Observation of excitonic and band-to-band behavior in ordered InGaP2 alloys
[DE94-018891] p 1314 N95-20341
First principles simulation of materials properties
[DE94-016781] p 1566 N95-20405
New ET-based organic superconductors with the organometallic anion Cu(CF3)4(-)
[DE94-016904] p 1567 N95-20479
An atomically-resolved STM study of the thermal decomposition of disilane on Si(001)
[AD-A279818] p 1567 N95-20544
Angle resolved Auger electron spectroscopy: An alternate tool for identifying electronic excitation processes in solids
[AD-A285375] p 1238 N95-20555
Gordon Research Conference on Physical Electrochemistry
[AD-A286545] p 1240 N95-20842
Anomalous vector-boson couplings in Majorana neutrino models
[PB95-127460] p 1518 N95-21220
Antishadowing contribution to the pomeron structure function
[PB95-127478] p 1518 N95-21221
T1F ((1) sigma (+)): Some preliminary electronic structure calculations
[PB95-130316] p 1518 N95-21223
Spin dependence of diffractive processes and implications for the small x behaviour of g1 and the spin content of the nucleon
[PB95-130332] p 1518 N95-21225
Parity nonconservation in radioactive atoms: An experimental perspective
[DE95-002737] p 1518 N95-21235
Progress in ultrafast scanning probe microscopy
[DE94-018179] p 1373 N95-21261
Photoemission and ferromagnetism
[DE95-002419] p 1520 N95-21362
Theoretical study of the noble metals on semiconductor surfaces and Ti-base shape memory alloys
[DE95-001654] p 1257 N95-21398
Consequences of oscillatory potentials and angular forces in transition metals and their aluminides
[DE94-019127] p 1258 N95-21600
Auger spectrometry of atoms and molecules
[DE94-018052] p 1524 N95-21664

Electronic structure and energies of alkaline earth oxides: MgO, CaO and SrO
[DE94-628990] p 1575 N95-21853

Electronic structure and relative stability of icosahedral superatoms in Al-transition-metal alloys
[DE94-628996] p 1260 N95-21855

Full potential multiple scattering theory
[DE95-003197] p 1576 N95-22084

The dynamic structure function of Bose liquids in the deep inelastic regime
[DE94-629077] p 1527 N95-22182

ATOMIC WEIGHTS

New high temperature plasmas and sample introduction systems for analytical atomic emission and mass spectrometry
[DE94-018580] p 1552 N95-20345

Is xenon eldest? p 1425 N95-21823

ATOMS

Atomic-resolution characterization of interface structure and chemistry in the STEM
[DE94-017753] p 1567 N95-20492

Auger spectrometry of atoms and molecules
[DE94-018052] p 1524 N95-21664

Experimental study of interactions of highly charged ions with atoms at keV energies
[DE94-018648] p 1529 N95-22316

Resonant charge transfer in hyperthermal atomic and molecular ion-surface collisions
[AD-A284937] p 1530 N95-22471

ATTACK AIRCRAFT

Naval aviation: F-14 upgrades are not adequately justified. Report to Congressional Committees
[AD-A286338] p 1206 N95-20212

Design of a controller for a flexible pointing system using H(infinity) synthesis
[AD-A286572] p 1481 N95-20828

ATTENTION

Intermediate levels of visual processing
[AD-A284922] p 1448 N95-19998

ATTENUATION

Degradation of aromatic hydrocarbons in an aquifer during a field experiment demonstrating the feasibility of remediation by natural attenuation
[AD-A283809] p 1282 N95-19922

Acoustic and vibration attenuation composite material
[AD-D016585] p 1233 N95-22467

ATTITUDE (INCLINATION)

Nonlinear dynamics of the planar pitch attitude motion for a gravity-gradient satellite
[AD-A286407] p 1220 N95-22204

ATTITUDE INDICATORS

Assessment of a non-dedicated GPS receiver system for precise airborne attitude determination
[DE94-019309] p 1205 N95-21520

AUDIO EQUIPMENT

FIREDOC users manual, 3rd edition
[PB95-128674] p 1286 N95-21129

AUDITORY PERCEPTION

Determination of multiple sound sources
[AD-A286563] p 1504 N95-20823

Signal- and listener- based factors in complex auditory pattern perception
[AD-A285636] p 1450 N95-21101

AUDITORY SIGNALS

Signal- and listener- based factors in complex auditory pattern perception
[AD-A285636] p 1450 N95-21101

AUDITORY STIMULI

Temporary threshold shifts produced by high intensity freefield impulse noise in humans wearing hearing protection
[AD-A286289] p 1454 N95-22045

AUGER EFFECT

Angle resolved Auger electron spectroscopy: An alternate tool for identifying electronic excitation processes in solids
[AD-A285375] p 1238 N95-20555

Research studies on short wavelength lasers by selective Auger processes
[AD-A285620] p 1372 N95-21144

Micromachined silicon-based analytical microinstruments for space science and planetary exploration
[DE94-019306] p 1367 N95-21507

Auger spectrometry of atoms and molecules
[DE94-018052] p 1524 N95-21664

AUGER SPECTROSCOPY

Optical properties of silicon clusters deposited on the basal plane of graphite
[DE94-017529] p 1542 N95-20450

Angle resolved Auger electron spectroscopy: An alternate tool for identifying electronic excitation processes in solids
[AD-A285375] p 1238 N95-20555

Auger spectrometry of atoms and molecules
[DE94-018052] p 1524 N95-21664

AUGMENTATION

Cavity-QED enhancement of fluorescence yields in microdroplets
[DE94-018662] p 1506 N95-20030

Development and enhancement of a model of performance and decision making under stress in a real life setting
[AD-A285945] p 1449 N95-20393

Performance, defect behavior and carrier enhancement in low energy, proton irradiated p+nn+ InP solar cells
p 1319 N95-20518

Enhancements in the Livermore spectrum analysis package PIXEF
[DE95-002487] p 1272 N95-20895

Modeling tropospheric ducting effects on satellite-to-ground paths p 1295 N95-20936

Translational-energy-resolved studies of photographed carrier-induced reactions on semiconductor surfaces
[DE95-002944] p 1573 N95-21444

AUSTENITE

The effect of oxide inclusions on the kinetics of the austenite to ferrite transformation in low alloy steel weld metal
[DE94-018131] p 1253 N95-20676

AUSTENITIC STAINLESS STEELS

Tritium and decay helium effects on the fracture toughness properties of types 316L, 304L and 21Cr-6Ni-9Mn stainless steels
[DE95-001248] p 1252 N95-20216

Joining dissimilar stainless steels for pressure vessel components
[PB95-133005] p 1380 N95-21446

AUTOCORRELATION

Direct numerical simulation for premixed turbulent combustion modelling p 1249 N95-21082

Theory of spin dynamics in the classical two-dimensional heisenberg magnet
[PB95-133559] p 1502 N95-22138

AUTOIONIZATION

Angle resolved Auger electron spectroscopy: An alternate tool for identifying electronic excitation processes in solids
[AD-A285375] p 1238 N95-20555

Physics of correlated studies
[DE95-001204] p 1581 N95-21842

The two-electron problem and prospects for atomic collision theory on a numerical lattice
[DE94-017856] p 1528 N95-22265

AUTOMATA THEORY

Introduction to the FIRE engine: A C++ toolkit for Finite automata and Regular Expressions
[PB95-110599] p 1456 N95-19891

GPS-Squitter capacity analysis
[AD-A280037] p 1291 N95-20599

Correctness of some algorithms to generate finite automata for regular expressions
[PB95-127551] p 1465 N95-21022

Design and implementation of the FIRE engine: A c++ toolkit for finite automata and regular expressions
[PB95-132924] p 1467 N95-21415

AUTOMATIC CONTROL

High-performance packet switching architecture for ATM: Conventional solution and neural network solution
[PB95-110920] p 1312 N95-19935

Recognition of subsurface defects in machined ceramics by application of neural networks to laser scatter patterns
[DE94-018373] p 1264 N95-20018

Software fault tree analysis of concurrent Ada processes
[AD-A284979] p 1457 N95-20042

Passive monitoring for automated MMPP communication systems p 1293 N95-20927

13th European Annual Conference on Human Decision Making and Manual Control
[PB95-132874] p 1450 N95-21284

Robotic paint stripping cell
[AD-A279158] p 1279 N95-21976

AUTOMATIC PILOTS

Collected papers of the Soar/IFOR project, Spring 1994
[AD-A280063] p 1216 N95-20624

AUTOMATIC REPEAT REQUEST

Adaptive error-control scheme for 2-200 MHz Multiple-Mechanism Propagation Paths
p 1293 N95-20926

AUTOMATIC TEST EQUIPMENT

Development of a tester for evaluation of prototype thermal cells and batteries
[DE95-000540] p 1325 N95-20628

AUTOMATION

Implementation of electronic chain-of-custody, analysis requests, and data verification at Los Alamos National Laboratory
[DE94-018076] p 1407 N95-21666

AUTOMOBILE ENGINES

Natural gas converter performance and durability
[PB95-135554] p 1284 N95-21966

AUTOMOBILES

2nd International ADI seminar
[PB95-127734] p 1255 N95-21108

Electrorheology for smart automotive suspensions
[AD-A285543] p 1380 N95-21157

AUTOMORPHISMS

Classification of diagonal coset modular invariants
[PB95-111118] p 1489 N95-20259

Von Neumann algebra automorphisms and time-thermodynamics relation in general covariant quantum theories
[PB95-111084] p 1580 N95-20324

AUTONOMOUS NAVIGATION

Unknown-terrains navigation of a mobile robot using an array of sonars
[DE94-017902] p 1482 N95-21385

Elements of deliberative robot control
[PB95-107595] p 1482 N95-21412

Tom Thumb algorithm for planning simple vehicle motions
[PB95-107553] p 1484 N95-22156

AUTONOMY

Testing paradigm applied to network structure (revised)
[PB95-110706] p 1487 N95-19906

Robust agent control of an autonomous robot with many sensors and actuators
[AD-A280148] p 1479 N95-20011

Task parallel programming in Fx
[AD-A285136] p 1475 N95-20500

Lidar technologies for airborne and space-based applications
[DE95-002954] p 1302 N95-21448

Layered path planning for an autonomous mobile robot
[AD-A286138] p 1485 N95-22244

AUTOPSIES

Thorium-232 in human tissues: Metabolic parameters and radiation doses
[DE94-019275] p 1441 N95-20074

AUTOREGRESSIVE PROCESSES

EPSCoR supplemental grant for an application of neural networks to seismic signal discrimination
[AD-A285846] p 1414 N95-20878

Application of neural networks to seismic signal discrimination research findings
[AD-A285848] p 1415 N95-21308

AVALANCHES

SPICE macro model of a spryton with MOSFET's in the avalanche mode
[DE94-015744] p 1555 N95-21134

AVIONICS

Advanced Packaging Concepts for Digital Avionics
[AGARD-CP-562] p 1208 N95-20631

The impact of advanced packaging technology on modular avionics architectures p 1208 N95-20632

Standard Hardware Acquisition and Reliability Program (SHARP) advanced SEM-E packaging
p 1208 N95-20633

FASTPACK: Optimized solutions for modular avionics derived from a parametric study. Part 1: Platform features p 1208 N95-20634

FASTPACK: Optimized solutions for modular avionics derived from a parametric study. Part 2: Avionics
p 1209 N95-20635

The Advanced Avionics Subsystem Technology Demonstration Program p 1209 N95-20636

Ultra-Reliable Digital Avionics (URDA) processor
p 1209 N95-20638

MCMs for avionics: Technology selection and intermodule interconnection p 1210 N95-20641

High density monolithic packaging technology for digital/microwave avionics p 1211 N95-20646

High performance backplane components for modular avionics p 1212 N95-20653

Composite cases for airborne electronic equipment: A technology study and EMC p 1212 N95-20655

Modular supplies for a distributed architecture --- avionics packaging p 1213 N95-20657

Modular CNI avionics system p 1213 N95-20659

The opportunities for and challenges of common integrated electronics
[AD-A279991] p 1327 N95-20966

Systems engineering design and technical analyses for Strategic Avionics Crew-station Design Evaluation Facility (SACDEF)
[AD-A286239] p 1213 N95-22024

Evaluation of the Haworth-Newman avionics Display Readability Scale
[AD-A286127] p 1214 N95-22232

AXIAL FLOW TURBINES
Laser anemometry and viscous computation of the flow through an annular turbine cascade
[AD-A280070] p 1341 N95-20968
AXIOMS
Real time process algebra with infinitesimals
[PB95-110623] p 1488 N95-20055
On the Taylor test. Part 3: A continuum mechanics code analysis of steady plastic wave propagation
[DE95-002252] p 1501 N95-20869
Semantics for a fine lambda-calculus with de Bruijn indices
[PB95-127577] p 1492 N95-21372
Note on the characterizations of the compromise value
[PB95-135117] p 1499 N95-21709
Dyads: A generalisation of monads
[PB95-134052] p 1494 N95-21867
Adjunctions
[PB95-134078] p 1494 N95-21868
Formal specification and compositional verification of an atomic broadcast protocol
[PB95-110508] p 1472 N95-22351
AXISYMMETRIC BODIES
A model of an infinite length, axisymmetric, isotropic, forced thick shell
[AD-A285586] p 1386 N95-21212
AXISYMMETRIC FLOW
An advanced ECR ion source with a large uniformly distributed ECR plasma volume for multiply charged ion beam generation
[DE95-001078] p 1515 N95-20911
Direct numerical simulation of incompressible axisymmetric flows p 1363 N95-22464
AZOLES
Density functional studies of decomposition processes of energetic molecules
[AD-A286185] p 1510 N95-20327

B

BACKGROUND NOISE
Adaptive detection in stationary and nonstationary noise environments
[AD-A279581] p 1300 N95-21099
Monolithic low noise preamplifier for piezoelectric sensors
[AD-D016524] p 1333 N95-21865
BACKGROUND RADIATION
Resonant photon-graviton conversion in EM fields: From earth to heaven
[DE95-002784] p 1301 N95-21241
BACKSCATTERING
High energy photon-photon collisions
[DE94-017494] p 1532 N95-20388
Angle resolved Auger electron spectroscopy: An alternate tool for identifying electronic excitation processes in solids
[AD-A285375] p 1238 N95-20555
The effects of multihop HF propagation on the performance of OTH backscatter radars
p 1298 N95-20953
Measurements of radar backscatter from the ocean surface at 94 GHz as a function of wind speed, direction and the modulation by the ocean waves during the SAXON-FPN experiment p 1299 N95-20960
Sounder calibration with backscattering from Losquet Island in the presence of multipaths
p 1300 N95-20961
Multiple scatter theory of ocean sediments
[AD-A286033] p 1433 N95-20999
Analysis of subgrid models using direct and large-eddy simulations of isotropic turbulence p 1348 N95-21071
Modelling anisotropy and backscatter effects in the subgrid scale stress tensor p 1349 N95-21077
Investigation on the backscattering properties of Finnish boreal forests at C- and X-band: A semi-empirical modeling approach
[PB95-127692] p 1389 N95-21105
In-situ capability of ion beam modification and characterization of materials at Los Alamos National Laboratory
[DE95-002738] p 1534 N95-21236
X-band microwave backscattering from ocean waves
[DE94-016719] p 1309 N95-22241
Design and construction of a Ka-band scatterometer
[AD-A286296] p 1368 N95-22322
A dynamic localization model with stochastic backscatter p 1359 N95-22445
Local dynamic subgrid-scale models in channel flow
p 1360 N95-22447
BACKWARD FACING STEPS
Large-eddy simulation of a plane wake
p 1360 N95-22446
BACTERIA
A review of Microbially Induced Corrosion (MIC) of steel and a preliminary investigation to determine its occurrence in naval vessels
[MRL-GD-0048] p 1250 N95-19910
Bacterial luciferase: Determination of the structure by x-ray diffraction
[AD-A279699] p 1437 N95-20711
Microbial degradation of polymers used in electronics
[AD-A286526] p 1273 N95-21011
The Use of Cyanobacteria to Explore Basic Biological Processes
[DE94-019238] p 1440 N95-22066
Electrostatic basis for molecular recognition in photosynthesis
[DE95-002979] p 1440 N95-22075
BACTERIOLOGY
Microbiology and physiology of anaerobic fermentations of cellulose
[DE95-002899] p 1438 N95-20917
BAGGAGE
Test and Evaluation Plan (TEP) for Improvised Explosive Device Screening Systems (IEDSS)
[AD-A286382] p 1203 N95-22319
BALL BEARINGS
Modeling of rolling element bearing mechanics. Computer program user's manual
[NASA-CR-196557] p 1381 N95-21692
Modeling of rolling element bearing mechanics. Theoretical manual
[NASA-CR-196556] p 1381 N95-21705
BALLISTIC MISSILES
Issues in the flight qualification of a space power reactor
[DE95-001606] p 1223 N95-21840
BALLISTICS
Tungsten-uranium penetrator target interaction
[DE95-000847] p 1387 N95-21364
BALLOON FLIGHT
Comparison of meteorological data with fitted values extracted from projectile trajectory
[AD-A285921] p 1428 N95-19989
BALLOON-BORNE INSTRUMENTS
An assessment of image reconstruction from balloon-borne and the IRAS data p 1592 N95-21752
CALIOPE and TAISIR airborne experiment platform
[DE94-018328] p 1310 N95-22299
BALLOONING MODES
Hybrid model in general geometry
[DE95-002614] p 1553 N95-20437
Solar flare MDH
[AD-A279894] p 1602 N95-20593
Current diffusive ballooning mode in second stability region of tokamaks
[DE94-770690] p 1554 N95-20683
Ideal Magnetohydrodynamic stabilities in JT-60 and D3-D tokamak plasmas
[DE94-770684] p 1555 N95-20987
Investigations of VH-mode in D3-D and JET
[DE94-015859] p 1556 N95-21142
Numerical analysis of energetic particle stabilization of ballooning modes in finite-aspect-ratio tokamaks
[DE94-631397] p 1556 N95-21164
BANACH SPACE
Weighted strongly elliptic operators on lie groups
[PB95-110847] p 1487 N95-19917
Sharp determinants
[PB95-111068] p 1488 N95-19944
Banach spaces with small spaces of operators
[PB95-111134] p 1489 N95-20273
BAND STRUCTURE OF SOLIDS
Observation of excitonic and band-to-band behavior in ordered InGaP2 alloys
[DE94-018891] p 1314 N95-20341
Photoreflectance and x ray diffraction study of semiconductor heterostructures and quantum wells
[PB95-127049] p 1582 N95-22432
BANDPASS FILTERS
A technique for increasing the bandwidth of high performance electrical backplanes p 1212 N95-20651
BANDWIDTH
Split-C and active messages under SUNMOS on the Intel Paragon
[DE94-011418] p 1474 N95-20123
Hydrostatic force sensor
[DE94-018923] p 1364 N95-20321
A technique for increasing the bandwidth of high performance electrical backplanes p 1212 N95-20651
LLNL/Lion Precision LVDT amplifier
[DE95-001504] p 1327 N95-20854
Line-of-sight multipath propagation measurements at 15 GHz over 500 MHz bandwidth p 1296 N95-20944
Mitigation of effects of multiple path nulls at super-high frequencies through diversity and networking
p 1297 N95-20948
Ultra-high aggregate bandwidth two-dimensional multiple-wavelength diode laser arrays
[AD-A280098] p 1372 N95-21019
A framework for symmetric band reduction and tridiagonalization
[DE95-002919] p 1476 N95-21341
Unlimited-bandwidth distributed optical phase modulators and detectors: Design and fabrication issues
[DE94-017418] p 1545 N95-21509
TDX: A high-bandwidth crossbar-switched communication paradigm
[DE94-017187] p 1311 N95-22407
BARENTS SEA
Monthly mean sea ice data from the Polar Ice Prediction System, the Regional Polar Ice Prediction System-Barents Sea and the Regional Polar Ice Prediction System-Greenland Sea
[AD-A280095] p 1433 N95-21018
BARIUM ALLOYS
Polyurethane self-priming topcoats
[AD-D016204] p 1274 N95-21154
Polyurethane self-priming topcoats
[AD-D016205] p 1274 N95-21155
BARIUM FLUORIDES
Liquid xenon as a potential laser host medium
[AD-A285365] p 1370 N95-20550
BARIUM OXIDES
Neutron diffraction study of the magnetic ordering of BaCuO(2+x)
[DE95-001357] p 1572 N95-21297
High temperature superconducting films and multilayers for electronics
[AD-A279545] p 1331 N95-21693
High performance YBCO films
[AD-A279560] p 1276 N95-21695
Local texture and strongly linked conduction in spray-pyrolyzed TlBa2Ca2Cu3O(8+x) deposits
[DE94-017887] p 1578 N95-22269
BAROCLINITY
Fourth International Symposium on Stratified Flows, volume 1
[AD-A286450] p 1354 N95-21583
Radar studies of aviation hazards
[AD-A285845] p 1203 N95-21831
BARRIER LAYERS
Improved broadband waveguide pressure window
[AD-D016487] p 1306 N95-21834
BARYONS
Diffusion enhances spontaneous electroweak baryogenesis
[DE94-017574] p 1512 N95-20451
Properties of strange-matter stars
[DE95-002329] p 1599 N95-20873
Strange hadronic matter
[DE94-019345] p 1521 N95-21484
The 9th INS scientific computational programs
[DE94-770780] p 1526 N95-22051
There might be two kinds of dibaryon
[DE94-014417] p 1526 N95-22058
Proton and produced particle distributions from Au+Au collisions at 11.6 A GeV/c
[DE94-018634] p 1530 N95-22392
BASALT
D/H ratios and H2O contents of mantle-derived amphibole megacrysts from Dish Hill, California
p 1416 N95-21781
Solar helium and neon in the Earth
p 1419 N95-21793
The primary carbon and the formation of carbon species in terrestrial magmas p 1420 N95-21797
Solubilities of nitrogen and noble gases in basalt melt
p 1422 N95-21807
Subduction of hydrated basalt of the oceanic crust: Implications for recycling of water into the upper mantle and continental growth p 1423 N95-21814
BASE FLOW
Free shear layers, base pressure and bluff-body drag
[AD-A286316] p 1200 N95-20175
Instability of streamwise vortices in plane channel flows p 1344 N95-21049
Nonlinear interaction between a pair of oblique modes in a supersonic mixing layer: Long-wave limit
[NASA-CR-197380] p 1357 N95-22173
BASE PRESSURE
Free shear layers, base pressure and bluff-body drag
[AD-A286316] p 1200 N95-20175
BASES (CHEMICAL)
Control of continuous phase PH using visible light to activate PH-dependent fibers and gels in a controlled and reversible manner
[AD-D016532] p 1543 N95-20728
BASIC (PROGRAMMING LANGUAGE)
BASIC program for power spectrum estimation
[DE95-002228] p 1468 N95-21515
Regularity of BPa-systems is decidable
[PB95-135489] p 1468 N95-21619

BATCH PROCESSING
Stochastic network processes
[AD-A279905] p 1475 N95-20566
BATHING
Personal hygiene body wipe
[AD-A286092] p 1454 N95-22274
BATHS
The application of electrodialysis to extend the lifetime of commercial electroplating baths
[DE95-000868] p 1246 N95-22012
BATHYMETERS
A modal analysis of currents in a Pacific Atoll lagoon
[AD-A283721] p 1431 N95-19971
Simulation of laser bathymetry for irregular bottoms
[PB95-133518] p 1434 N95-21320
BAUSCHINGER EFFECT
Residual stress analysis in swage autofrettaged thick-walled cylinders by position-sensitive x-ray diffraction techniques
[AD-A286383] p 1388 N95-22320
BAYES THEOREM
An object-oriented optimization systems
[DE94-016190] p 1459 N95-20165
Beyond maximum entropy: Fractal Pixon-based image reconstruction p 1593 N95-21757
Bayesian analysis of semiparametric proportional hazards models
[AD-A279394] p 1499 N95-21946
BAYS (TOPOGRAPHIC FEATURES)
Measurements of radar backscatter from the ocean surface at 94 GHz as a function of wind speed, direction and the modulation by the ocean waves during the SAXON-FPN experiment p 1299 N95-20960
BEAM CURRENTS
Induction linacs for heavy ion fusion
[DE95-002357] p 1534 N95-20891
Emittance growth due to negative-mass instability above transition
[DE95-002527] p 1534 N95-20900
Beam instability studies at the APS
[DE95-001448] p 1537 N95-21503
Very high-power electron-beam transport in long gas cells from 10(exp -3) to 10(exp 3) Torr N2
[DE95-002611] p 1539 N95-22306
Bunched beam instability with frequency spread
[DE94-018632] p 1539 N95-22357
BEAM INJECTION
Transition-energy crossing with a gamma(sub t)(-)jump
[DE94-017315] p 1531 N95-20021
ALT-2 armor tile design for upgraded TEXTOR operation
[DE94-015749] p 1549 N95-20143
A tau-charm-factory at Argonne
[DE94-016913] p 1510 N95-20360
Plasma shape experiments for an optimized tokamak
[DE94-017508] p 1553 N95-20445
Experimental investigation of molecular beam injection in HL-1 tokamak
[DE94-631456] p 1556 N95-21165
Fusion power production in TFTR
[DE95-002756] p 1557 N95-21240
Heating and transport in TFTR D-T plasmas
[DE95-002812] p 1558 N95-21242
The 12-GeV/c beam transfer and absorber lines for the Superconducting Super Collider
[DE95-002100] p 1538 N95-21733
Experience at the Los Alamos Meson Physics Facility with the use of alloy Inconel 718 as an enclosure for a beam degrader and as a proton beam entry window
[DE94-018289] p 1538 N95-22050
Gas-dynamic trap diagnostic complex for study on plasma heating and power atomic beam injection
[DE94-633377] p 1529 N95-22283
Low emittance lattices for electron storage rings revisited
[DE94-017302] p 1540 N95-22391
BEAM INTERACTIONS
Emittance growth due to negative-mass instability above transition
[DE95-002527] p 1534 N95-20900
Simulation of beam-beam lifetime for LEP
[DE95-002888] p 1536 N95-21334
Experience at the Los Alamos Meson Physics Facility with the use of alloy Inconel 718 as an enclosure for a beam degrader and as a proton beam entry window
[DE94-018289] p 1538 N95-22050
Recent results in analysis and simulation of beam halo
[DE94-018313] p 1539 N95-22298
BEAM SPLITTERS
Eigenmode method for electromagnetic synthesis of diffractive elements with three-dimensional profiles
[PB95-127726] p 1301 N95-21107
BEAM SWITCHING
Angle diversity on digital microwave links: Antenna design and experimental results p 1297 N95-20947
BEAM WAVEGUIDES
The efficiency calibration of the DSS-24 34-meter beam-waveguide antenna p 1305 N95-21542
BEAMFORMING
Modeling the dynamics of charged-particle beams using a Fokker-Planck approach
[DE95-001458] p 1531 N95-19983
Crystalline beam in a storage ring: How long can it last?
[DE94-017303] p 1563 N95-20014
Signal-to-noise gain from adaptive matched-field beamforming of multidimensional acoustic arrays
[AD-A285671] p 1503 N95-20084
Analytic models for beam propagation and far-field patterns in slab and bow-tie x ray lasers
[DE94-016607] p 1372 N95-21173
Measurements of the Auburn ECE optical system parameters for temperature fluctuation measurements on TEXT-U
[DE94-019217] p 1562 N95-22120
BEAMS (RADIATION)
Experimental and theoretical evaluation of elastic waves in curved layered media
[AD-A286578] p 1504 N95-20918
Diffraction applications using the energy dispersive beamline, X6A, at NSLS
[DE94-019287] p 1572 N95-21408
Self-starting femtosecond pulse generation from a Ti:sapphire laser synchronously pumped by a pointing-stabilized mode-locked Nd:YAG laser
[DE94-019319] p 1374 N95-21480
RF beam control for the AGS Booster
[DE95-001485] p 1538 N95-21720
BEAMS (SUPPORTS)
Static stability of a three-dimensional space truss p 1220 N95-20533
Vibration analysis of the AN/SPS-67(V)3 surface search radar
[AD-A286050] p 1302 N95-21324
BEARINGS
Fracture analysis of an all-ceramic bearing system
[AD-A285056] p 1269 N95-20486
BEDROCK
VTT test borehole for bedrock investigations
[PB95-132965] p 1427 N95-22095
BEND TESTS
Processing and mechanical properties of laminar Al2O3-Ni3Al composites
[DE94-019332] p 1230 N95-21481
BENDING
Inelastic bending and torsion of steel I-beams
[PB94-208378] p 1384 N95-19975
BENZENE
Refractive index change in dissociating shocked benzene
[DE94-019015] p 1541 N95-20352
Effect of external stress on the transport of fluids in thermoplastic resin systems
[AD-A279993] p 1270 N95-20596
Aromatics oxidation and soot formation in flames
[DE95-001803] p 1241 N95-21280
NMR relaxation behavior of the head group of SHBS in lamellar liquid crystals
[AD-A279124] p 1574 N95-21599
BENZOIC ACID
Evaluation of an immobilized cell bioreactor for degradation of meta- and para-nitrobenzoate
[AD-A279719] p 1516 N95-20993
Polyurethane self-priming topcoats
[AD-D016204] p 1274 N95-21154
Polyurethane self-priming topcoats
[AD-D016205] p 1274 N95-21155
BERYLLIUM COMPOUNDS
Beryllium based multilayers for normal incidence extreme ultraviolet reflectivity
[DE94-015560] p 1274 N95-21175
BETA PARTICLES
Wall stabilization effects in D3-D high beta discharges
[DE94-017509] p 1554 N95-20446
High efficiency GaP power conversion for Betavoltaic applications p 1323 N95-20540
Radioactive check sources for alpha and beta sensitive radiological instrumentation
[DE94-016477] p 1366 N95-21138
BETATRONS
Modeling of beam dynamics and comparison with measurements for the Advanced Light Source (ALS)
[DE94-017970] p 1532 N95-20495
Behaviour of space-charge dominated ion beams in storage rings
[DE94-015845] p 1517 N95-21140
BIAS
A charge distribution analysis instrument for catalysis and material science applications
[DE94-016489] p 1364 N95-20233
Heuristic genetic algorithms for constrained problems. Part 1: Principles
[PB95-132031] p 1467 N95-21374
BIBLIOGRAPHIES
Bibliography of scientific publications 1975-1993
[AD-A279767] p 1444 N95-20977
FIREDOC users manual, 3rd edition
[PB95-128674] p 1286 N95-21129
Bibliography of Lewis Research Center technical publications announced in 1993
[NASA-TM-106666] p 1589 N95-21187
NASA Langley scientific and technical information output: 1994, volume 1
[NASA-TM-109170-VOL-1] p 1589 N95-21189
Utilizing artificial neural networks in network flow analysis: An annotated bibiliography
[DE95-002453] p 1482 N95-21522
Aeronautical engineering: A continuing bibliography with indexes (supplement 315)
[NASA-SP-7037(315)] p 1199 N95-21640
NASA patent abstracts bibliography: A continuing bibliography. Section 2: Indexes (supplement 46)
[NASA-SP-7039(46)-SECT-2] p 1590 N95-21948
Age 60 study. Part 1: Bibliographic database
[AD-A286245] p 1446 N95-22027
Studies in nonlinear problems of energy
[DE95-001387] p 1356 N95-22148
BICRYSTALS
Simulations of the dislocation array at Ge/Si interfaces
[DE94-017680] p 1565 N95-20244
BINARY CODES
Adaptive error-control scheme for 2-200 MHz Multiple-Mechanism Propagation Paths p 1293 N95-20926
Scalable programming environment
[AD-A286390] p 1472 N95-22201
BINARY DATA
Long sequence correlation coprocessor
[AD-D016558] p 1313 N95-20280
Error probabilities of FFH/BFSK with noise normalization and soft decision viterbi decoding in a fading channel with partial-band jamming
[AD-A280041] p 1498 N95-20620
Eigenmode method for electromagnetic synthesis of diffractive elements with three-dimensional profiles
[PB95-127726] p 1301 N95-21107
Design, fabrication, and characterization of reflective diffractive optical elements in Si for free-space optical interconnects
[AD-A286416] p 1547 N95-22205
Synthesis and characterization of single-source molecular precursors to binary metal sulphides: Bis(diethyldithiocarbamato) M(2)trialkylphosphine (M = Zn and Cd) adducts
[AD-A279746] p 1248 N95-22385
BINARY MIXTURES
Molecular-based study of solutions in supercritical solvents
[DE94-019326] p 1580 N95-21420
BINARY STARS
Relativistic binary neutron star coalescence
[DE94-019311] p 1600 N95-21479
BINDERS (MATERIALS)
Polyurethane self-priming topcoats
[AD-D016204] p 1274 N95-21154
Polyurethane self-priming topcoats
[AD-D016205] p 1274 N95-21155
BINOCULAR VISION
Factors affecting the perception of luning in monocular regions of partial binocular overlap displays
[AD-A286287] p 1547 N95-22044
BIOASSAY
Monitoring bioremediation of Volatile Organic Compounds (VOCs) using Fourier Transform Infrared (FT-IR) spectrometry
[AD-A279631] p 1403 N95-20456
Flow cytometry: A powerful technology for measuring biomarkers
[DE94-018284] p 1440 N95-22296
BIOASTRONAUTICS
Annual program analysis of the NASA Space Life Sciences Research and Education Support Program
[NASA-CR-197298] p 1439 N95-21529
BIOCHEMISTRY
Microbiology and physiology of anaerobic fermentations of cellulose
[DE95-002899] p 1438 N95-20917
Potential-of-mean-force description of ionic interactions and structural hydration in biomolecular systems
[DE95-000859] p 1438 N95-21366
Effect of increased venous backflow on the release of cardiac hormone. Fine structural, immunohistochemical, and biochemical study
[PB95-130399] p 1445 N95-21424

Nitrogen control of chloroplast differentiation
[DE95-002797] p 1439 N95-21526

BIOCONVERSION

Bioconversion of coal derived synthesis gas to liquid fuels
[DE94-017381] p 1282 N95-19927

Bioconversion of coal derived synthesis gas to liquid fuels
[DE94-018849] p 1314 N95-20339

Anaerobic Treatment of Municipal Solid Waste and Sludge for Energy Production and Recycling of Nutrients
[DE95-700217] p 1315 N95-20369

Anaerobic digestion analysis model: User's manual
[DE94-011858] p 1437 N95-20471

Producing liquid fuels from biomass
[DE95-717458] p 1398 N95-22425

BIODEGRADABILITY

Investigation on research for degradable plastics
[DE94-796550] p 1277 N95-21714

BIODEGRADATION

A review of Microbially Induced Corrosion (MIC) of steel and a preliminary investigation to determine its occurrence in naval vessels
[MRL-GD-0048] p 1250 N95-19910

Evaluation of an immobilized cell bioreactor for degradation of meta- and para-nitrobenzoate
[AD-A279719] p 1516 N95-20993

Microbial degradation of polymers used in electronics
[AD-A286526] p 1273 N95-21011

BIODYNAMICS

Analysis of musculo-skeletal loading using electromyography and biomechanical modelling
[PB95-135828] p 1444 N95-21007

BIOELECTRICITY

Magnetic source imaging of visually evoked and oscillatory electrical activity of the human brain
[PB95-127205] p 1448 N95-22476

BIOENGINEERING

Seminar on Biomedical Engineering 1993
[PB95-104402] p 1443 N95-20971

Calculation of atom-centered partial charges for heme
[DE94-014447] p 1520 N95-21375

Proposal for a tutorial on Minimal Length Encoding (MLE) in molecular biology
[DE94-015076] p 1438 N95-21376

Command history, 1993
[AD-A279775] p 1446 N95-21989

Life Sciences Division and Center for Human Genome Studies
[DE94-017796] p 1440 N95-22065

BIOGEOCHEMISTRY

Closure on the global carbon cycle
[DE94-018617] p 1404 N95-20991

BIOINSTRUMENTATION

Mechanism of the amperometric response of a proposed glucose sensor based on a polypyrrole-tubule-impregnated membrane
[AD-A279836] p 1365 N95-20431

BIOLOGICAL EFFECTS

Aerospace medicine and biology: A continuing bibliography with indexes (supplement 399)
[NASA-SP-7011(399)] p 1446 N95-21947

The Use of Cyanobacteria to Explore Basic Biological Processes
[DE94-019238] p 1440 N95-22066

Optical radiation: Health based exposure limits for electromagnetic radiation in the wavelength range from 100 nanometer to 1 millimeter
[PB95-132767] p 1447 N95-22083

Urban air carcinogens and their effects on health
[DE95-002259] p 1447 N95-22285

Study of pulsed laser effects on living tissues
[PB95-131330] p 1447 N95-22361

BIOLOGICAL MODELS (MATHEMATICS)

A physiological neural network for saccadic eye movement control
[AD-A279599] p 1441 N95-20301

Modeling platform dynamics and physiological response to short arm centrifugation
[AD-A279640] p 1442 N95-20457

Calculation of atom-centered partial charges for heme
[DE94-014447] p 1520 N95-21375

Discovering related DNA sequences via mutual information
[DE95-001101] p 1440 N95-22067

BIOLUMINESCENCE

Bacterial luciferase: Determination of the structure by x-ray diffraction
[AD-A279699] p 1437 N95-20711

BIOMAGNETISM

Evaluation of superconducting quantum interference devices interfaced with digital signal processing electronics for biomagnetic applications
[DE94-016186] p 1289 N95-20164

Source distribution of visual evoked neuromagnetic responses
[PB95-127643] p 1445 N95-21348

Magnetic source imaging of visually evoked and oscillatory electrical activity of the human brain
[PB95-127205] p 1448 N95-22476

BIOMASS

Assessment of liquefaction and pyrolysis systems
[PB95-129797] p 1236 N95-20290

Radiative forcing calculations for CH3Cl
[DE94-019018] p 1402 N95-20355

Investigation on the backscattering properties of Finnish boreal forests at C- and X-band: A semi-empirical modeling approach
[PB95-127692] p 1389 N95-21105

A low energy continuous reactor separator for the production of ethanol from corn grits/starch and biomass streams
[DE95-002256] p 1283 N95-21356

Hydrothermal conversion of carbohydrates and related compounds
[PB95-134011] p 1396 N95-22175

BIOMASS ENERGY PRODUCTION

Producing liquid fuels from biomass
[DE95-717458] p 1398 N95-22425

BIOMEDICAL DATA

A 3D stereo data visualization and representation
[AD-A284788] p 1449 N95-20064

BIOMETRICS

DSP control of superconducting quantum interference devices
[DE94-016193] p 1313 N95-20168

BIONICS

Analysis of musculo-skeletal loading using electromyography and biomechanical modelling
[PB95-135828] p 1444 N95-21007

BIOPHYSICS

Physics Division research and development
[DE94-017685] p 1501 N95-20246

Israel Physical Society Annual Meeting 1994
[DE94-630140] p 1565 N95-20261

BIOPOLYMERS

Monomer mapping: A PC-based software tool facilitating the determination of monomer compositions from mass spectrometric molecular weight data
[PB95-132155] p 1275 N95-21470

BIOREACTORS

Bioconversion of coal derived synthesis gas to liquid fuels
[DE94-017381] p 1282 N95-19927

Bioconversion of coal derived synthesis gas to liquid fuels
[DE94-018849] p 1314 N95-20339

Evaluation of an immobilized cell bioreactor for degradation of meta- and para-nitrobenzoate
[AD-A279719] p 1516 N95-20993

BIOSYNTHESIS

Nitrogen control of chloroplast differentiation
[DE95-002797] p 1439 N95-21526

The molecular mechanics program DUPLEX: Computing structures of carcinogen modified DNA by surveying the potential energy surface
[DE94-019153] p 1439 N95-21606

BIOT NUMBER

Transport phenomena in the micropores of plug-type phase separators
[NASA-TM-108479] p 1340 N95-20561

BIOTECHNOLOGY

Spinoff, 1994
[NASA-NP-214] p 1594 N95-21893

BIOTITE

Noble gas isotopes and halogens in volatile-rich inclusions in diamonds p 1417 N95-21784

BIPOLAR TRANSISTORS

Physical Si(1-x)Ge(x)/Si heterojunction bipolar transistor model for device and circuit simulation
[PB95-110896] p 1312 N95-19934

Non-linear A/D converters for integrated silicon smart sensors
[PB94-208402] p 1330 N95-21590

BIREFRINGENCE

Physical-chemical studies on rodlike polymer compositions
[AD-A285361] p 1269 N95-20548

3-D TECATE/BREW: Thermal, stress, and birefringent ray-tracing codes for solid-state laser design
[DE95-000330] p 1376 N95-22301

BISMALEIMIDE

Thermo-mechanical fatigue of polymer matrix composites
[AD-A285931] p 1267 N95-20390

BISMUTH

Research on the power generation system with thermoelectric conversion elements
[DE95-714804] p 1397 N95-22309

BISMUTH ALLOYS

A new metallographic procedure for edge retention of enclosed surfaces
[DE94-017549] p 1261 N95-22048

BISMUTH COMPOUNDS

Sputter deposition of multilayer thermoelectric films: An approach to the fabrication of two-dimensional quantum wells
[DE95-002396] p 1272 N95-20892

BISMUTH OXIDES

Effects of neutron irradiation on the London penetration depth for polycrystalline Bi(1.8)Pb(0.3)Sr2Ca2Cu3O10 superconductor
[DE94-019335] p 1573 N95-21483

BIT ERROR RATE

Error probabilities of FFH/BFSK with noise normalization and soft decision viterbi decoding in a fading channel with partial-band jamming
[AD-A280041] p 1498 N95-20620

Turbo codes for deep-space communications
p 1304 N95-21535

High speed optical storage technology
[AD-A285788] p 1456 N95-22400

BITS

Design of a massively parallel computer using bit serial processing elements
[NASA-CR-197365] p 1479 N95-22406

BLACK HOLES (ASTRONOMY)

Cosmological string solutions by dimensional reduction
[DE95-002858] p 1599 N95-21245

BLANKETS (FUSION REACTORS)

MHD pressure drop in ducts with imperfectly insulating coatings
[DE95-002852] p 1558 N95-21244

MHD-flow in slotted channels with conducting walls
[DE94-018370] p 1559 N95-21388

BLOCK COPOLYMERS

Reactive compatibilization of polymer blends
[AD-A284836] p 1263 N95-19893

Hierarchical structure in advanced polymers. Phase behaviour, orientation, properties
[AD-A285938] p 1268 N95-20392

Morphology of highly textured E/EP diblock copolymers
[AD-A279813] p 1269 N95-20582

BLOCKING

Duality and equivalencies in closed tandem queueing networks
[PB95-132502] p 1482 N95-21271

BLOOD

Preclinical investigation of lyophilized platelet preparations
[AD-A286079] p 1443 N95-20851

Solubilities of nitrogen and helium in water and blood at 37 C and pressures of up to 11 ATA
[AD-A286269] p 1446 N95-22003

BLOOD CELLS

Effect of increased venous backflow on the release of cardiac hormone. Fine structural, immunohistochemical, and biochemical study
[PB95-130399] p 1445 N95-21424

BLOOD FLOW

Effect of increased venous backflow on the release of cardiac hormone. Fine structural, immunohistochemical, and biochemical study
[PB95-130399] p 1445 N95-21424

BLOOD PLASMA

Effect of increased venous backflow on the release of cardiac hormone. Fine structural, immunohistochemical, and biochemical study
[PB95-130399] p 1445 N95-21424

Hypervolemia in men from drinking hyperhydration fluids at rest and during exercise
[NASA-TM-4657] p 1439 N95-21544

BLOOD VESSELS

Carboxyhemoglobin formation due to transient exposure to high level carbon monoxide: Experimental results and an explanatory model
[AD-A285476] p 1444 N95-20979

BLOOD VOLUME

Hypervolemia in men from drinking hyperhydration fluids at rest and during exercise
[NASA-TM-4657] p 1439 N95-21544

Intramyocardial blood volume and oxygen exchange
[PB95-108015] p 1445 N95-21580

BLOWDOWN WIND TUNNELS

The dynamic approach to rotor blade research: ARA's oscillatory test facility
[ARA-MEMO-405] p 1200 N95-20758

BLUFF BODIES

Free shear layers, base pressure and bluff-body drag
[AD-A286316] p 1200 N95-20175

Research on bluff body vortex wakes
[AD-A286319] p 1200 N95-20177

BLUNT BODIES
Shock wave interactions in hypervelocity flow [AD-A286507] p 1357 N95-22212
BODY CENTERED CUBIC LATTICES
Metastable bcc phase formation in the Nb-Cr-Ti system [DE94-016212] p 1255 N95-21137
Novel materials and devices from self-assembled periodic structures [AD-A286499] p 1232 N95-22211
BODY KINEMATICS
A method to determine the kinematics of the lower limbs of a subject pedaling a bicycle using encoders and accelerometers [NASA-CR-197401] p 1453 N95-21866
BODY-WING CONFIGURATIONS
Open Skies project computational fluid dynamic analysis [AD-A285928] p 1200 N95-19991
BOILERS
Recent reflux receiver developments under the US DOE program [DE95-001622] p 1393 N95-20861
BOLTZMANN TRANSPORT EQUATION
Numerical investigations of low-density nozzle flow by solving the Boltzmann equation [NASA-TM-110492] p 1354 N95-21675
An analytical, inelastic, space and time dependent electron distribution for electrically excited gases [DE95-003478] p 1528 N95-22223
BOLTZMANN-VLASOV EQUATION
Evaluating impedances in a Sacherer integral equation [DE94-016823] p 1489 N95-20266
Quantum diffusion [DE95-001015] p 1580 N95-21264
Explicit analytical solution of the nonlinear Vlasov Poisson system [DE94-628931] p 1500 N95-21592
BOMBER AIRCRAFT
Bomber force 2000: Operational concepts for long-range combat aircraft [AD-A279378] p 1206 N95-20181
Systems engineering design and technical analyses for Strategic Avionics Crew-station Design Evaluation Facility (SACDEF) [AD-A286239] p 1213 N95-22024
BONDED JOINTS
Attachment methodology for composite cylinder assembly [AD-D016578] p 1227 N95-20459
BONDING
The Modified Embedded Atom Method [DE94-015746] p 1564 N95-20142
Spectroscopic studies of glass structure [DE94-016551] p 1268 N95-20468
Atomically resolved structure and bonding of delta-doped boron layers on Si(001) [AD-A279820] p 1513 N95-20586
Reliability assessment of Multichip Module technologies via the Triservice/NASA RELTECH program p 1210 N95-20643
Assuring Known Good Die (KGD) for reliable, cost effective MCMs p 1210 N95-20644
Selenophene transition metal complexes [DE95-001675] p 1260 N95-21841
Towards tailored interphase formation utilizing surface-bound benzylsulfonium salts as cationic initiators [AD-A286461] p 1280 N95-22259
The Modified Embedded Atom Method [DE94-017958] p 1248 N95-22273
BOOLEAN ALGEBRA
Using local optimality criteria for efficient information retrieval with redundant information filters [AD-A279603] p 1587 N95-20302
BOOMS (EQUIPMENT)
Ohmsett test of NOFI Vee-Sweep and NOFI 600S Oilboom [AD-A279525] p 1408 N95-21685
BOREHOLES
VTT test borehole for bedrock investigations [PB95-132965] p 1427 N95-22095
BORIDES
Magnetic field dependence of the correlation gap in SmB6 [DE95-001684] p 1574 N95-21570
BORON
Processing and characterization of Ni-Al-Fe-B shape-memory alloy wires produced by rapid solidification [DE94-017702] p 1250 N95-20020
Boron carbide-based coatings on graphite for plasma facing components [DE94-017976] p 1269 N95-20570
Atomically resolved structure and bonding of delta-doped boron layers on Si(001) [AD-A279820] p 1513 N95-20586
BORON ALLOYS
Atom probe field ion microscopy of type 308 CRE stainless steel welds [DE94-019162] p 1261 N95-22127
BORON CARBIDES
Boron carbide-based coatings on graphite for plasma facing components [DE94-017976] p 1269 N95-20570
B4C-SiC reaction-sintered coatings on graphite plasma facing components [DE94-019105] p 1230 N95-21553
BORON ISOTOPES
Boron neutrino flux and the MSW solution of the solar neutrino problem [DE95-001861] p 1521 N95-21443
BORON NITRIDES
Effects of ambient conditions on the adhesion of cubic boron nitride films on silicon substrates [DE94-016779] p 1266 N95-20281
Radio-frequency techniques at the ISIS pulsed muon source [PB95-129854] p 1529 N95-22303
BOROSILICATE GLASS
International collaboration program on innovative chemical processing of superior electronic and optical materials [AD-A285122] p 1226 N95-20105
BOSE GEOMETRY
The dynamic structure function of Bose liquids in the deep inelastic regime [DE94-629077] p 1527 N95-22182
BOSONS
CDF top results in the lepton + jets channel [DE95-000641] p 1507 N95-20131
Search for W pair production with dilepton decay modes at D0 [DE95-000724] p 1508 N95-20134
Measurements of the mass and width of the W boson from CDF [DE94-015380] p 1511 N95-20415
Search for right-handed currents in the decay chain of K(+) yields muon(+)nu(sub muon), muon(+) yields e(+)nu(sub e)nu(bar)(sub muon) [DE94-770606] p 1514 N95-20756
Unbinned maximum likelihood fit for the CP conserving couplings for W + photon production at CDF [DE95-001471] p 1514 N95-20852
Calculation of Z plus four jet production at the Tevatron [PB95-130472] p 1580 N95-21230
Measuring A(sub b) with polarized beams at SLC [DE95-002865] p 1519 N95-21248
The 9th INS scientific computational programs [DE94-770780] p 1526 N95-22051
Tests of structure functions using lepton pairs: W-charge asymmetry at CDF [DE95-000560] p 1527 N95-22122
Electroweak boson pair production in p(-p) collisions at the square root of s = 1.8 TeV [DE95-000725] p 1527 N95-22194
Physics at the Fermilab Collider [DE95-000726] p 1539 N95-22195
BOTTLES
Investigation on research for degradable plastics [DE94-796550] p 1277 N95-21714
BOUNDARIES
Hindered settling computations using a parallel boundary element method [DE94-014286] p 1339 N95-20137
Antiphase boundaries as nucleation centers in low-temperature epitaxial growth [AD-A279895] p 1568 N95-20594
BOUNDARY CONDITIONS
Influence of primary boundary conditions on the buckling of shallow cylindrical shells [PB94-208352] p 1384 N95-20003
The (e,2e) calculations with the final-state boundary condition [DE94-631342] p 1509 N95-20198
Continuum transient and frozen startup behavior of conventional and gas-loaded heat pipes [AD-A284297] p 1339 N95-20250
On the sputtering of metals and insulators: A nonlinear evolution problem with nonlinear boundary condition [DE95-001456] p 1254 N95-20792
Numerical simulation of spatially-developing planar jets p 1351 N95-21087
Understanding the mechanisms of length scale competition: The sine-Gordan soliton case [DE94-016201] p 1500 N95-21136
Modeling open boundary conditions by using the optimization approach [AD-A285548] p 1433 N95-21158
Domain processes in ferroelectric ceramics [AD-A279567] p 1276 N95-21697
Absorbing boundary condition for floating two-dimensional objects in current and waves [PB95-132882] p 1356 N95-22063
Inverse and control problems in electromagnetics [AD-A286438] p 1310 N95-22250
Electro-optic effect in the PESO acousto-optic modulator [AD-A286355] p 1548 N95-22255
BOUNDARY ELEMENT METHOD
Analyses of some benchmark cases in fracture mechanics using boundary element method [PB95-110888] p 1384 N95-19930
Hindered settling computations using a parallel boundary element method [DE94-014286] p 1339 N95-20137
BOUNDARY INTEGRAL METHOD
Analyses of some benchmark cases in fracture mechanics using boundary element method [PB95-110888] p 1384 N95-19930
Inverse and control problems in electromagnetics [AD-A286438] p 1310 N95-22250
BOUNDARY LAYER CONTROL
Flow coefficient behavior for boundary layer bleed holes and slots [NASA-TM-106846] p 1338 N95-19953
Supersonic laminar flow control research [NASA-CR-196049] p 1353 N95-21340
Experimental investigations of on-demand vortex generators p 1361 N95-22451
BOUNDARY LAYER FLOW
Role of pressure diffusion in non-homogeneous shear flows p 1345 N95-21053
Simulations of bypass transition for spatially evolving disturbances p 1349 N95-21079
Experiments on the flow field physics of confluent boundary layers for high-lift systems [NASA-CR-197318] p 1201 N95-21343
Acoustics of laminar boundary layers breakdown p 1361 N95-22455
Small-scale behavior in distorted turbulent boundary layers at low Reynolds number p 1362 N95-22456
Numerical study of boundary layer interaction with shocks: Method and code validation p 1362 N95-22461
BOUNDARY LAYER SEPARATION
Direct numerical simulation of 2-D and 3-D instability waves in a laminar separation bubble p 1352 N95-21095
Seismic evidence for volatiles at large depth in the Earth p 1422 N95-21808
BOUNDARY LAYER STABILITY
Numerical study of realistic perturbations in three-dimensional boundary layers p 1351 N95-21091
On subcritical instability of the attachment line boundary layer p 1351 N95-21092
Computational studies of laminar to turbulence transition [AD-A285622] p 1353 N95-21146
Supersonic laminar flow control research [NASA-CR-196049] p 1353 N95-21340
BOUNDARY LAYER TRANSITION
Application of Direct and Large Eddy Simulation to Transition and Turbulence [AGARD-CP-551] p 1346 N95-21061
Numerical study of realistic perturbations in three-dimensional boundary layers p 1351 N95-21091
Spatial direct numerical simulation of boundary layer transition under strong adverse pressure gradient p 1351 N95-21093
Investigation of shear layer transition using various turbulence models p 1352 N95-21096
Computational studies of laminar to turbulence transition [AD-A285622] p 1353 N95-21146
Acoustic receptivity due to weak surface inhomogeneities in adverse pressure gradient boundary layers [NASA-TM-4577] p 1353 N95-21258
Supersonic laminar flow control research [NASA-CR-196049] p 1353 N95-21340
Acoustics of laminar boundary layers breakdown p 1361 N95-22455
BOUNDARY LAYERS
Open Skies project computational fluid dynamic analysis [AD-A285928] p 1200 N95-19991
An evaluation of 915-MHz radar wind profiler/RASS by tower and sodar measurements [DE94-018913] p 1364 N95-20320
Data report: Stress measurements in the bottom boundary layer with BASS tripods STRESS 2 1990-1991 [AD-A279875] p 1433 N95-20433
Numerical simulation of supersonic boundary layer transition p 1348 N95-21074
Direct numerical simulations of leading-edge receptivity for freestream sound p 1351 N95-21090

Spatial direct numerical simulation of boundary layer transition under strong adverse pressure gradient
p 1351 N95-21093

BOUNDARY LUBRICATION

Evaluation of PS 212 coatings under boundary lubrication conditions with an Ester-based oil to 300 C
[NASA-TM-106763] p 1223 N95-19901

Lubricant evaluation and performance, 2
[AD-A279144] p 1278 N95-21969

BOUNDARY VALUE PROBLEMS

Multigrid with matrix-dependent transfer operators for convection-diffusion problems
[PB95-110821] p 1487 N95-19915

Analyses of some benchmark cases in fracture mechanics using boundary element method
[PB95-110888] p 1384 N95-19930

The method of auxiliary mapping for the finite element solutions of elasticity problems containing singularities
[AD-A285689] p 1489 N95-20274

Stabilization and control problems in structural dynamics
[AD-A279996] p 1340 N95-20312

Explicit parallel two-step Runge-Kutta-Nystroem methods
[PB95-135752] p 1489 N95-20423

Parallelism across the steps in iterated Runge-Kutta methods for stiff initial value problems
[PB95-135760] p 1490 N95-20424

COYOTE II: A finite element computer program for nonlinear heat conduction problems. Part 1: Theoretical background
[DE95-002587] p 1463 N95-20887

VLUGr3: A vectorizable adaptive grid solver for PDEs in 3D. 2: Code description
[PB95-135737] p 1465 N95-21033

Numerical analysis of energetic particle stabilization of ballooning modes in finite-aspect-ratio tokamaks
[DE94-631397] p 1556 N95-21164

Numerical wave speed for one-dimensional scalar hyperbolic conservation laws with source terms
[PB95-127536] p 1492 N95-21371

Computer simulation of the diocotron instability
[AD-A285655] p 1559 N95-21403

Error committed by stopping the Newton iteration in Runge-Kutta methods and linear multistep methods
[PB95-106324] p 1492 N95-21421

Positive rockland operators
[PB95-127510] p 1493 N95-21423

Parallel predictor-corrector methods
[PB95-135711] p 1493 N95-21434

VLUGR3: A vectorizable adaptive grid solver for PDEs in 3D. 1: Algorithmic aspects and applications
[PB95-135729] p 1467 N95-21435

Applied mathematical problems in modern electromagnetics
[AD-A286448] p 1303 N95-21462

Uniform upper bounds in the Froehlich polaron theory
[DE94-628998] p 1525 N95-21860

BRAGG ANGLE

X-band microwave backscattering from ocean waves
[DE94-016719] p 1309 N95-22241

BRAGG CELLS

A three-dimensional orthogonal laser velocimeter for the NASA Ames 7- by 10-foot wind tunnel
[NASA-TM-108864] p 1366 N95-21323

BRAIN

Netherlands Institute for Brain Research progress report, 1993
[PB95-135398] p 1445 N95-21352

How the brain works
[AD-A279138] p 1450 N95-21968

Magnetic source imaging of visually evoked and oscillatory electrical activity of the human brain
[PB95-127205] p 1448 N95-22476

BRANCHING (MATHEMATICS)

Direct simulation of tridimensional wake of NACA 0012 profile p 1350 N95-21086

Hamiltonian structure of the reversible nonsemisimple 1:1 resonance
[PB95-127528] p 1495 N95-22151

BRAZING

Strength testing of Ti-vapor-coated silicon nitride braze joints
[DE94-017858] p 1280 N95-22266

BREADBOARD MODELS

Eddy current for detecting second-layer cracks under installed fasteners
[AD-A279871] p 1382 N95-20414

Development, fabrication, and metrology of the electro-optical breadboard model for the reflection grating array of the XMM grating spectrometer
[DE94-016605] p 1543 N95-20612

High speed optical storage technology
[AD-A285788] p 1456 N95-22400

BREATHING APPARATUS

Method and apparatus for non-invasive evaluation of diaphragmatic function
[NASA-CASE-LAR-13888-1] p 1441 N95-20408

BREMSSTRAHLUNG

Dilepton production from p-p to Ca-Ca at the Bevalac
[DE95-002341] p 1520 N95-21357

BRIDGMAN METHOD

Directional solidification of the alumina-zirconia ceramic eutectic system
[DE95-001677] p 1277 N95-21735

BRIGHTNESS

The variation of the dust temperature within late-type spiral galaxies p 1593 N95-21766

BRIGHTNESS TEMPERATURE

Deriving earth science products from SSM/I
[NASA-CR-197299] p 1389 N95-20156

BRITTLE MATERIALS

Analysis of the progressive failure of brittle matrix composites
[NASA-CR-195415] p 1225 N95-19951

The processing and mechanical properties of high temperature/high performance composites. Stress redistribution and notch properties, book 2
[AD-A279737] p 1227 N95-20429

Reliability analysis of uniaxially ground brittle materials
[NASA-TM-106852] p 1386 N95-20790

The processing and mechanical properties of high temperature/high performance composites. Processing/property correlations, book 4
[AD-A279739] p 1228 N95-20802

A study of mechanical processing damage in brittle materials
[DE95-002126] p 1276 N95-21585

The role of microcracking on the crack growth resistance of brittle solids and composites
[DE95-001678] p 1231 N95-21736

BRITTLENESS

Fracture behavior of the Fe-8Al alloy FAP-Y
[DE95-000956] p 1258 N95-21676

BROADBAND

A wideband EMP test system
[DE94-015283] p 1290 N95-20474

A wideband propagation simulator for high speed mobile radio communications p 1295 N95-20934

Line-of-sight multipath propagation measurements at 15 GHz over 500 MHz bandwidth p 1296 N95-20944

Broadband pressure barrier for circular waveguide
[AD-D016503] p 1306 N95-21672

Improved broadband waveguide pressure window
[AD-D016487] p 1306 N95-21834

Breakdown of the law of large numbers in Josephson junction series arrays
[DE94-629075] p 1576 N95-21996

Broadband thermal optical limiter for the protection of eyes and sensors
[AD-D016493] p 1377 N95-22304

BROADCASTING

Passive monitoring for automated MMPP communication systems p 1293 N95-20927

Formal specification and compositional verification of an atomic broadcast protocol
[PB95-110508] p 1472 N95-22351

BROKEN SYMMETRY

New strong interactions above the electroweak scale
[DE94-018385] p 1506 N95-20025

Complementarity of e(+)e(-) and pp colliders for the exploration of electroweak symmetry breaking
[DE94-017397] p 1507 N95-20034

New improved derivative expansion for field theories with spontaneous symmetry breaking
[DE94-019349] p 1580 N95-21486

BROMIDES

Neutron molelcular spectroscopy: Future prospects
[PB95-130357] p 1518 N95-21227

Surface x-ray scattering and scanning tunneling microscopy studies at the Au(111) electrode
[DE95-002409] p 1573 N95-21516

Modeling of nonlinear optic and ESR response of CDW MX materials
[DE94-018301] p 1578 N95-22297

BROMINE ISOTOPES

An investigation of the applicability of the new ion exchange resin, Reillex(TM)-HPQ, in ATW separations
[DE94-016576] p 1274 N95-21234

BROWNIAN MOVEMENTS

Magnetic flocculation of paramagnetic particles
[DE94-018144] p 1501 N95-20725

BRUCITE

Phase E in a water-saturated peridotite system at 9.3 GPa p 1420 N95-21799

BSCCO SUPERCONDUCTORS

Carrier doping and interlayer coupling in HTSC single crystals
[DE94-018637] p 1564 N95-20127

Dependence of critical current density on microstructure and processing of high-T(c) superconductors
[DE95-000685] p 1571 N95-21167

Vortex dynamics in a ring-like irradiated Bi2Sr2CaCu2O8 crystal
[DE95-001682] p 1573 N95-21569

Overview of the field and temperature dependence of J(c) in Ag/BSCCO tapes
[PB95-110318] p 1574 N95-21636

Aligned bismuth, strontium, calcium cuprate coatings on polycrystalline substrates
[AD-D016512] p 1278 N95-21907

Anisotropic transport properties of BSCCO single crystals and Ag-clad tapes in high magnetic fields
[DE95-000938] p 1575 N95-21936

How to improve J(c(T)) in Ag/(BiPb)2Sr2Ca2Cu3O10 tapes
[PB95-110326] p 1575 N95-21949

BUBBLES

The Combustive Sound Source
[ARL-TR-94-9] p 1503 N95-19911

Direct numerical simulation of 2-D and 3-D instability waves in a laminar separation bubble
p 1352 N95-21095

On the dynamics of a shock-bubble interaction
[NASA-CR-194978] p 1495 N95-22325

BUCKLING

Influence of primary boundary conditions on the buckling of shallow cylindrical shells
[PB94-208352] p 1384 N95-20003

BUFFETING

Pressure measurements on an F/A-18 twin vertical tail in buffeting flow. Volume 4, part 1: Buffet cross spectral densities
[AD-A285593] p 1215 N95-21214

Pressure measurements on an F/A-18 twin vertical tail in buffeting flow. Volume 1: Wind tunnel test summary
[AD-A279126] p 1202 N95-21877

BUILDINGS

Global equivalence ratio concept and the prediction of carbon monoxide formation in enclosure fires
[PB94-207511] p 1234 N95-20100

Summaries of BFRL fire research in-house projects and grants, 1994
[PB95-130845] p 1286 N95-21130

Fire smoke ventilation through shafts: Experiments
[PB95-132247] p 1288 N95-21978

BULK ACOUSTIC WAVE DEVICES

Carrier dynamics in InGaAs: Quantum wells versus bulk
[DE94-018205] p 1577 N95-22168

BULK MODULUS

Hydrogen and related materials at high density: Physics, chemistry and planetary implications
p 1418 N95-21791

BUNDLES

Fiber-optic rotary joint with bundle collimator assemblies
[AD-D016504] p 1545 N95-21673

BUOYANCY

Investigation of a thermal buoyancy effect on the drag of half models tested in the ARA Transonic Wind Tunnel
[ARA-MEMO-407] p 1199 N95-19946

The dynamic role of ridges in a beta-plane channel. Towards understanding the dynamics of large scale circulation in the Southern Ocean
[AD-A279390] p 1435 N95-21943

Absorbing boundary condition for floating two-dimensional objects in current and waves
[PB95-132882] p 1356 N95-22063

BURGER EQUATION

Optimal active control for Burgers equations
p 1361 N95-22454

BURN-IN

A new mini Ball Grid Array (mBGA) multichip module technology
[DE94-018897] p 1480 N95-20342

Assuring Known Good Die (KGD) for reliable, cost effective MCMs p 1210 N95-20644

Consortia for Known Good Die (KGD), phase 1
[AD-A279407] p 1383 N95-21933

BURNING RATE

High pressure windowed chamber burned rate determination of liquid propellant XM46
[AD-A283770] p 1282 N95-19920

BURNOUT

Collocated tunable wavenumber sensor/actuators for smart structures
[AD-A279608] p 1312 N95-19958

BUS CONDUCTORS

Augmented thermal bus
[NASA-CASE-LEW-15595-1-C] p 1338 N95-19933

BUTANES

The energetics and dynamics of free radicals, ions, and clusters
[DE94-018101] p 1244 N95-21701

BUTENES
The energetics and dynamics of free radicals, ions, and clusters
[DE94-018101] p 1244 N95-21701
BUTYRIC ACID
Bioconversion of coal derived synthesis gas to liquid fuels
[DE94-018849] p 1314 N95-20339
BY-PRODUCTS
Laboratory evaluation of a reactive baffle approach to NOx control
[AD-A283802] p 1400 N95-19921
Production of S2F10, S2OF10 and S2O2F10 by spark discharges in SF6*
[DE95-001421] p 1243 N95-21500
BYPASSES
Simulations of bypass transition for spatially evolving disturbances p 1349 N95-21079
Direct numerical determination of the minimum bypass Reynolds number in boundary layers
p 1349 N95-21080

C

C (PROGRAMMING LANGUAGE)
Status of CFDLIB performance tests on the T3D
[DE95-002708] p 1478 N95-21925
C++ (PROGRAMMING LANGUAGE)
Introduction to the FIRE engine: A C+ + toolkit for Finite automata and Regular Expressions
[PB95-110599] p 1456 N95-19891
Design of a parallel object oriented programming language
[AD-A284924] p 1457 N95-20000
Design and implementation of the FIRE engine: A c+ + toolkit for finite automata and regular expressions
[PB95-132924] p 1467 N95-21415
Object-oriented design of preconditioned iterative methods
[PB95-110276] p 1469 N95-21655
The navigation toolkit
[NASA-CR-197290] p 1205 N95-22161
CADMIUM SULFIDES
International collaboration program on innovative chemical processing of superior electronic and optical materials
[AD-A285122] p 1226 N95-20105
Polycrystalline thin film cadmium telluride solar cells fabricated by electrodeposition
[DE94-011848] p 1391 N95-20118
Nonlinear Faraday effect in CdS semiconductor in an ultrahigh magnetic field
[DE94-016804] p 1564 N95-20240
Advances in polycrystalline thin-film photovoltaics for space applications p 1318 N95-20514
CADMIUM TELLURIDES
Polycrystalline thin film cadmium telluride solar cells fabricated by electrodeposition
[DE94-011848] p 1391 N95-20118
Polycrystalline CuInSe2 and CdTe solar cells
[DE94-011875] p 1392 N95-20333
Advances in polycrystalline thin-film photovoltaics for space applications p 1318 N95-20514
IR materials producibility
[AD-A280094] p 1328 N95-21017
Processing and modeling issues for thin-film solar cell devices
[DE94-011895] p 1394 N95-21294
Thin-film cadmium telluride photovoltaic cells
[DE94-011886] p 1395 N95-21508
CALCITE
Storage and recycling of water and carbon dioxide in the earth p 1425 N95-21822
CALCIUM OXIDES
Effects of neutron irradiation on the London penetration depth for polycrystalline Bi(1.8)Pb(0.3)Sr2Ca2Cu3O10 superconductor
[DE94-019335] p 1573 N95-21483
Electronic structure and energies of alkaline earth oxides: MgO, CaO and SrO
[DE94-628990] p 1575 N95-21853
Local texture and strongly linked conduction in spray-pyrolyzed TlBa2Ca2Cu3O(8+x) deposits
[DE94-017887] p 1578 N95-22269
CALCULUS
General conservative extension theorem in process algebra
[PB95-110656] p 1487 N95-19902
Real time process algebra with infinitesimals
[PB95-110623] p 1488 N95-20055
Beyond beta-reduction in Church's lambda yield
[PB95-110565] p 1488 N95-20149
Semantics for a fine lambda-calculus with de Bruijn indices
[PB95-127577] p 1492 N95-21372
CALIBRATING
A comparative survey of current and proposed tropospheric refraction-delay models for DSN radio metric data calibration
[NASA-CR-197338] p 1412 N95-20002
Deriving earth science products from SSM/I
[NASA-CR-197299] p 1389 N95-20156
Error analysis in wind turbine field testing
[DE94-011864] p 1391 N95-20260
High precision Woelter optic calibration facility
[DE94-016973] p 1542 N95-20364
16-foot transonic tunnel test section flowfield survey
[NASA-TM-109157] p 1216 N95-20669
The production of calibration specimens for impact testing of subsize Charpy specimens
[DE94-018125] p 1386 N95-20703
The calculation and measurement of Helmholtz coil fields
[AD-A286081] p 1228 N95-20808
Impact of propagation mechanisms on global navigation satellite system performance p 1298 N95-20950
Sounder calibration with backscattering from Losquet Island in the presence of multipaths
p 1300 N95-20961
Radioactive check sources for alpha and beta sensitive radiological instrumentation
[DE94-016477] p 1366 N95-21138
The efficiency calibration of the DSS-24 34-meter beam-waveguide antenna p 1305 N95-21542
CTD calibration and processing methods used at Woods Hole Oceanographic Institution
[AD-A279507] p 1435 N95-21681
Absolute, Extreme-ultraviolet Solar Spectral Irradiance Monitor (AESSIM)
[AD-A279345] p 1603 N95-21929
VTT test borehole for bedrock investigations
[PB95-132965] p 1427 N95-22095
CALIFORNIA
A numerical study of wind forcing effects on the California Current System
[AD-A286205] p 1435 N95-21880
CALORIMETERS
Application of a dimensionless parameter model for Laser Beam Welding
[DE94-018902] p 1378 N95-20048
Monolithic circuits for lead-glass calorimetry
[DE94-019112] p 1330 N95-21554
CAMERAS
A scalable video rate camera interface
[AD-A286144] p 1474 N95-20325
Passive range measurement system
[AD-D016222] p 1544 N95-21100
CANADA
Propagation measurements on a troposcatter link in the Canadian High Arctic p 1295 N95-20940
CANCELLATION
General purpose sidelobe canceller system
[AD-D016560] p 1289 N95-20270
CANCER
Urban air carcinogens and their effects on health
[DE95-002259] p 1447 N95-22285
CANS
Corrosion evaluation of fuel canister crusher rigging
[DE95-002962] p 1257 N95-21452
CANTILEVER BEAMS
Corrosion behavior of landing gear steels
[AD-A285862] p 1261 N95-22132
CAPACITANCE
LLNL/Lion Precision LVDT amplifier
[DE95-001504] p 1327 N95-20854
Surface micromachined capacitive tactile image sensor
[PB95-108031] p 1288 N95-21633
Design of a 10 bit 10k Samples/s low power CMOS ADC
[PB95-110425] p 1455 N95-22018
CAPACITANCE SWITCHES
Sequential shock induced switch tests for Eglin Air Force Base
[DE95-001786] p 1334 N95-22062
CAPACITORS
Monolithic low noise preamplifier for piezoelectric sensors
[AD-D016524] p 1333 N95-21865
Integration of thin film decoupling capacitors
[DE95-001609] p 1333 N95-21881
CAPILLARY FLOW
An augmented Young-Laplace model of an evaporating meniscus in a micro-channel with high heat flux
[NASA-CR-197622] p 1340 N95-20796
CAPTURE EFFECT
The ORNL Neutron-Capture Cross Section Facility
[DE94-019146] p 1537 N95-21460
CARBAMATES (TRADENAME)
Structure of dibis(diethyldithiocarbamato) zinc (2) Mu-bis(diethylphosphino)ethane toluene(2)
[AD-A279792] p 1224 N95-20660
CARBOHYDRATES
A low energy continuous reactor separator for the production of ethanol from corn grits/starch and biomass streams
[DE95-002256] p 1283 N95-21356
Hydrothermal conversion of carbohydrates and related compounds
[PB95-134011] p 1396 N95-22175
Structures and functions of oligosaccharins
[DE95-003195] p 1440 N95-22220
CARBON
The thermal conductivity of carbon coated silicon carbide fibers embedded in a silicon carbide matrix
[DE94-017758] p 1225 N95-20023
Natural gas cleanup:- Evaluation of a molecular sieve carbon as a pressure swing adsorbent for the separation of methane/nitrogen mixtures
[DE94-012263] p 1234 N95-20135
Novel catalysts for methane activation
[DE95-002639] p 1237 N95-20438
Boron carbide-based coatings on graphite for plasma facing components
[DE94-017976] p 1269 N95-20570
Study of small carbon and semiconductor clusters using negative ion threshold photodetachment spectroscopy
[DE95-002327] p 1515 N95-20872
Calculated heats of formation of some predicted stable C, N, O, F molecules
[AD-A285957] p 1517 N95-21127
Nitrogen alloyed martensitic steels
[PB95-127791] p 1255 N95-21128
Friction and wear properties of as-deposited and carbon ion-implanted diamond films
[NASA-TM-106759] p 1274 N95-21252
Corrosion evaluation of fuel canister crusher rigging
[DE95-002962] p 1257 N95-21452
The primary carbon and the formation of carbon species in terrestrial magmas p 1420 N95-21797
The ratios of carbon and non-radiogenic helium and argon isotopes in the mantle and crustal rocks
p 1421 N95-21805
Characterization and performance of DLC films synthesized by plasma and ion beam techniques
[DE94-018287] p 1281 N95-22428
CARBON COMPOUNDS
Computational evaluation of the feasibility of nitrating precursors to C12N12O12
[AD-A285976] p 1239 N95-20668
Studies of the microwave resistivity of kappa-(BEDT-TTF)2Cu(N(CN)2)Cl
[DE95-002980] p 1262 N95-22291
CARBON CYCLE
Closure on the global carbon cycle
[DE94-018617] p 1404 N95-20991
CARBON DIOXIDE
Energy impacts of controlling carbon dioxide emissions from an integrated gasification/combined-cycle system
[DE94-016878] p 1403 N95-20478
Photochemistry of intermolecular C-H bond activation reactions
[DE94-018417] p 1239 N95-20682
The Carnol process for methanol production and utilization with reduced CO2 emissions
[DE94-016808] p 1283 N95-21211
Removal of CO2 in closed loop off-gas treatment systems
[DE94-019259] p 1407 N95-21617
Impact degassing of water and noble gases from silicates p 1416 N95-21780
Origin and loss of the volatiles of the terrestrial planets p 1417 N95-21785
Volatiles in the deep Earth: An experimental study using the laser-heated diamond cell p 1421 N95-21803
The ratios of carbon and non-radiogenic helium and argon isotopes in the mantle and crustal rocks
p 1421 N95-21805
Storage and recycling of water and carbon dioxide in the earth p 1425 N95-21822
Development of active-transport membrane devices
[DE94-015947] p 1246 N95-21921
Numerical study of contaminant effects on combustion of hydrogen, ethane, and methane in air
[NASA-TM-106844] p 1284 N95-22114
Modeling of collision induced absorption spectra of CO2-CO2 pairs for planetary atmosphere of Venus
[NASA-CR-197373] p 1601 N95-22338
CARBON DIOXIDE LASERS
Approach to compact terawatt CO2 laser system for particle acceleration
[DE95-002170] p 1371 N95-20866

Effect of laser radiation on carbon fibre/epoxy composites
[PB95-133526] p 1232 N95-22096

CARBON DISULFIDE
Effect of external stress on the transport of fluids in thermoplastic resin systems
[AD-A279993] p 1270 N95-20596

CARBON FIBERS
The thermal conductivity of carbon coated silicon carbide fibers embedded in a silicon carbide matrix
[DE94-017758] p 1225 N95-20023
The thermal conductivity of carbon-fiber reinforced metal matrix composites
[DE94-017767] p 1226 N95-20125
Thermo-mechanical fatigue of polymer matrix composites
[AD-A285931] p 1267 N95-20390
Wear resistant composite structure of vitreous carbon containing convoluted fibers
[DE95-002254] p 1228 N95-20787
Carbon fiber reinforced superconductor composites
[DE95-002504] p 1229 N95-20913
Damage tolerance of carbon fibre polyetheretherketone laminates
[PB95-131611] p 1230 N95-21432
Effect of laser radiation on carbon fibre/epoxy composites
[PB95-133526] p 1232 N95-22096

CARBON ISOTOPES
The ratios of carbon and non-radiogenic helium and argon isotopes in the mantle and crustal rocks
p 1421 N95-21805

CARBON MONOXIDE
Laboratory evaluation of a reactive baffle approach to NOx control
[AD-A283802] p 1400 N95-19921
Global equivalence ratio concept and the prediction of carbon monoxide formation in enclosure fires
[PB94-207511] p 1234 N95-20100
Bioconversion of coal derived synthesis gas to liquid fuels
[DE94-018849] p 1314 N95-20339
Carboxyhemoglobin formation due to transient exposure to high level carbon monoxide: Experimental results and an explanatory model
[AD-A285476] p 1444 N95-20979
Evaluation of the technical performance of the Duttch National Air Quality Monitoring Network in 1992
[PB95-131892] p 1405 N95-21327
Monitoring activities in the framework of the Dutch National Air Quality Monitoring Network in 1994
[PB95-131884] p 1406 N95-21351
The interaction of localized solutions in a surface reaction
[DE95-002736] p 1248 N95-22433

CARBON STEELS
Theoretical-experimental study on the electroslag remelting technology of high quality steels
[DE94-629216] p 1256 N95-21270
Corrosion evaluation of fuel canister crusher rigging
[DE95-002962] p 1257 N95-21452

CARBON TETRACHLORIDE
Resonance Raman spectroscopy of volatile organics: Carbon tetrachloride
[DE95-000627] p 1233 N95-19980

CARBONACEOUS METEORITES
Primitive Xe in the atmospheres of Earth and mars
p 1419 N95-21795

CARBONATES
Actinide(IV) and actinide(VI) carbonate speciation studies by PAS and NMR spectroscopies
[DE94-016957] p 1236 N95-20361
Multiply manifolded molten carbonate fuel cells
[DE94-017074] p 1392 N95-20480
Molten carbonate fuel cell product development test
[DE95-000005] p 1324 N95-20574
The development of a new plasticizer for poly(ethylene oxide) based polymer electrolyte and the investigation of their ion-pair dissociation effect
[DE94-016821] p 1276 N95-21644
Storage and recycling of water and carbon dioxide in the earth p 1425 N95-21822

CARBONYL COMPOUNDS
Photochemistry of intermolecular C-H bond activation reactions
[DE94-018417] p 1239 N95-20682
Dynamic NMR studies of restricted arene rotation in the chromiu tricarbonyl thiophene and selenophene complexes
[DE95-001656] p 1257 N95-21399

CARBORANE
Ceramics formed by pyrolysis of either linear or thermosetting carborane (siloxane or silane) acetylene based precursor polymers
[AD-D016563] p 1266 N95-20291

CARBOXYHEMOGLOBIN
Carboxyhemoglobin formation due to transient exposure to high level carbon monoxide: Experimental results and an explanatory model
[AD-A285476] p 1444 N95-20979

CARBOXYHEMOGLOBIN TEST
Carboxyhemoglobin formation due to transient exposure to high level carbon monoxide: Experimental results and an explanatory model
[AD-A285476] p 1444 N95-20979

CARBOXYL GROUP
New chiral pyrimidino-crown ether ligands
[AD-A279892] p 1223 N95-20590

CARCINOGENS
The molecular mechanics program DUPLEX: Computing structures of carcinogen modified DNA by surveying the potential energy surface
[DE94-019153] p 1439 N95-21606
Urban air carcinogens and their effects on health
[DE95-002259] p 1447 N95-22285
Cellular responses to environmental DNA damage
[DE94-015606] p 1441 N95-22397

CARDIAC AURICLES
Effect of increased venous backflow on the release of cardiac hormone. Fine structural, immunohistochemical, and biochemical study
[PB95-130399] p 1445 N95-21424

CARDIOVASCULAR SYSTEM
Modeling platform dynamics and physiological response to short arm centrifugation
[AD-A279640] p 1442 N95-20457
Intramyocardial blood volume and oxygen exchange
[PB95-108015] p 1445 N95-21580
The influence of coronary artery disease on +Gz tolerance: A preliminary study
[AD-A279305] p 1446 N95-21941

CARDS
An IBM based ARINC interface
[ARL-TR-21] p 1471 N95-22104

CARRIAGES
A user's guide to LUGSAN 1.1: A computer program to calculate and archive lug and sway brace loads for aircraft-carried stores
[DE95-001919] p 1207 N95-21730

CARRIER DENSITY (SOLID STATE)
Magnetic interactions in the Emery model
[DE94-629059] p 1577 N95-22181

CARRIER FREQUENCIES
Passive monitoring for automated MMPP communication systems p 1293 N95-20927
Development of a fast sampling system for estimation of impulse responses of mobile radio channels
p 1296 N95-20943

CARRIER LIFETIME
Translational-energy-resolved studies of photographed carrier-induced reactions on semiconductor surfaces
[DE95-002944] p 1573 N95-21444
Transient photoluminescence measurements on GaAs and AlGaAs double heterostructures
[AD-A279408] p 1575 N95-21916
The role of point defects and defect complexes in silicon device processing
[DE94-011876] p 1279 N95-22091

CARTESIAN COORDINATES
A control volume method on an icosahedral grid for numerical integration of the shallow-water equations on the sphere
[DE94-016345] p 1489 N95-20170
Quantization in curvilinear coordinates
[DE94-770603] p 1514 N95-20737

CASCADE CONTROL
Pre-amplifier with multi-stage feedback
[AD-D016254] p 1336 N95-22418

CASCADE FLOW
Experimental study of vane heat transfer and aerodynamics at elevated levels of turbulence
[NASA-CR-4633] p 1337 N95-19912
Laser anemometry and viscous computation of the flow through an annular turbine cascade
[AD-A280070] p 1341 N95-20968
Homogeneous turbulence subjected to mean flow with elliptic streamlines p 1345 N95-21056

CASES (CONTAINERS)
Composite cases for airborne electronic equipment: A technology study and EMC p 1212 N95-20655

CASSEGRAIN ANTENNAS
The efficiency calibration of the DSS-24 34-meter beam-waveguide antenna p 1305 N95-21542

CASSINI MISSION
GPHS-RTGs in support of the Cassini Mission
[DE95-001492] p 1222 N95-20853

CAST ALLOYS
Microstructures and tensile properties of as-cast iron-aluminide alloys
[DE94-017868] p 1252 N95-20359
Surface technology programme
[PB95-132866] p 1262 N95-22174

CASTING
Solidification modeling of a spiral casting to determine material fluidity
[DE94-018930] p 1285 N95-20050
Relationship between dendrite coherency and castability of some commercial foundry alloys
[PB95-110243] p 1258 N95-21652

CASTINGS
Improved die castings through plasma surface modification, improved sensors and die soldering prevention
[DE95-002238] p 1253 N95-20417

CATALYSIS
Cluster reactions: An approach to understanding the fundamentals of heterogeneous catalysis
[DE95-002947] p 1243 N95-21447
A catalytic method for the conversion of silanes to stannanes
[AD-A286214] p 1247 N95-22020
Catalyzed reduction of nitrate in aqueous solutions
[DE94-017660] p 1247 N95-22049
Hydrothermal conversion of carbohydrates and related compounds
[PB95-134011] p 1396 N95-22175

CATALYSTS
Direct catalytic decomposition of nitric oxide
[DE94-018840] p 1233 N95-20045
Superior catalysts for selective catalytic reduction of nitric oxide
[DE94-018845] p 1234 N95-20046
Correlations between surface structure and catalytic activity/selectivity
[DE94-019023] p 1234 N95-20052
Selective methane oxidation over promoted oxide catalysts
[DE94-012270] p 1235 N95-20188
Investigation of syngas interaction in alcohol synthesis catalysts
[DE94-018784] p 1236 N95-20349
Novel catalysts for methane activation
[DE95-002639] p 1237 N95-20438
Technology development for cobalt F-T catalysts
[DE94-017363] p 1241 N95-21172
Effects of increased UV-B radiation on phytoplankton: A preliminary study and research programme
[PB95-133732] p 1439 N95-21884
Natural gas converter performance and durability
[PB95-135554] p 1284 N95-21966
Bridging the pressure gap: In situ atomic-level investigations of model platinum catalyst surfaces under reaction conditions by scanning tunneling microscopy
[DE95-002346] p 1246 N95-21990
Lower active metals loading for hydrotreating catalysts
[DE94-018907] p 1261 N95-22119
Transient studies of low temperature catalysts for methane conversion
[DE95-003560] p 1247 N95-22224
Gas-phase photocatalytic oxidation: Cost comparison with other air pollution control technologies
[DE95-000241] p 1410 N95-22278
Catalytic reactions of synthesis gas. Part 3. Determination of reaction kinetics
[PB95-127759] p 1248 N95-22329

CATALYTIC ACTIVITY
Superior catalysts for selective catalytic reduction of nitric oxide
[DE94-018845] p 1234 N95-20046
Technology development for cobalt F-T catalysts
[DE94-017363] p 1241 N95-21172
Hydrogenation of nitriles on a well-characterized nickel surface: From surface science studies to liquid phase catalytic activity measurements
[DE94-018184] p 1259 N95-21707
Bridging the pressure gap: In situ atomic-level investigations of model platinum catalyst surfaces under reaction conditions by scanning tunneling microscopy
[DE95-002346] p 1246 N95-21990
Transient studies of low temperature catalysts for methane conversion
[DE95-003560] p 1247 N95-22224

CATHODES
Photoelectrons beam measurement from a magnesium cathode in a RF electron gun
[DE94-017994] p 1533 N95-20573
Molten carbonate fuel cell product development test
[DE95-000005] p 1324 N95-20574
Applied physics research for innovation in pulsed power
[AD-A285392] p 1324 N95-20610
Field-emitter arrays for RF vacuum microelectronics
[AD-A279959] p 1325 N95-20661
Cathode Life Test Facility
[AD-A286232] p 1334 N95-22023

CATHODIC COATINGS

Characterization and performance of DLC films synthesized by plasma and ion beam techniques
[DE94-018287] p 1281 N95-22428

CATHODOLUMINESCENCE

Visible light emitting materials and injection devices
[AD-A284796] p 1541 N95-20066

CATIONS

Direct catalytic decomposition of nitric oxide
[DE94-018840] p 1233 N95-20045

Spectroscopic studies of glass structure
[DE94-016551] p 1268 N95-20468

The dynamics of formation and evaporation of mixed alkali halide nanocrystals: A case of comparable lattice energies
[AD-A285052] p 1567 N95-20483

Novel fluorine oxidizers
[AD-A279480] p 1284 N95-21678

The energetics and dynamics of free radicals, ions, and clusters
[DE94-018101] p 1244 N95-21701

CAUCHY PROBLEM

Approximate Riemann solver for magnetohydrodynamics (that works in more than one dimension)
[PB95-135802] p 1553 N95-20425

Hybrid Upwind Splitting (HUS) by a field-by-field decomposition
[NASA-TM-106843] p 1355 N95-21957

CAULKING

Frame and edge seal technology: A state of the art survey
[PB95-110334] p 1288 N95-22014

CAVITATION FLOW

Applications of sonochemistry
[AD-A286388] p 1506 N95-22360

CAVITIES

Measurements of shielding effectiveness and cavity characteristics of airplanes
[PB94-210051] p 1289 N95-20191

Improved die castings through plasma surface modification, improved sensors and die soldering prevention
[DE95-002238] p 1253 N95-20417

Large eddy simulation of turbulent flow over a cavity
p 1347 N95-21069

Small cavity nonresonant tunable microwave-frequency alternating current scanning tunneling microscope
[AD-A285752] p 1328 N95-21218

Competition between electromagnetic modes in a free-electron maser
[AD-A279546] p 1374 N95-21694

CAVITY FLOW

DNS of turbulent flow in a driven cavity and their analysis using proper orthogonal decomposition
p 1352 N95-21097

Instabilities in natural-convection flows in cavities
[PB95-107975] p 1354 N95-21578

CAVITY RESONATORS

An 8-meter-long coupled cavity RFQ linac
[DE94-018077] p 1331 N95-21667

CD-ROM

Common mapping system media study
[AD-A279086] p 1390 N95-21912

CELESTIAL MECHANICS

Erice International Seminars on Planetary Emergencies. 17th Workshop: The Collision of an Asteroid or Comet with the Earth
[AD-A280122] p 1600 N95-21577

CELL CATHODES

Photoelectrons beam measurement from a magnesium cathode in a RF electron gun
[DE94-017994] p 1533 N95-20573

CELL MEMBRANES (BIOLOGY)

Cell membrane potentials induced during exposure to EMP fields
[DE94-018952] p 1439 N95-21548

Electrostatic basis for molecular recognition in photosynthesis
[DE95-002979] p 1440 N95-22075

CELLS (BIOLOGY)

Monoclonal antibodies directed against surface molecules of multicell spheroids
[NASA-CR-197367] p 1437 N95-20559

Flow cytometry: A powerful technology for measuring biomarkers
[DE94-018284] p 1440 N95-22296

Cellular responses to environmental DNA damage
[DE94-015606] p 1441 N95-22397

CELLULOSE

Microbiology and physiology of anaerobic fermentations of cellulose
[DE95-002899] p 1438 N95-20917

CENSUS

Census US civil aircraft calendar year 1993
[AD-A286309] p 1199 N95-20091

CENTER OF MASS

Signals for top quark anomalous chromomagnetic moments at colliders
[DE95-002896] p 1535 N95-21254

CENTRAL NERVOUS SYSTEM

A physiological neural network for saccadic eye movement control
[AD-A279599] p 1441 N95-20301

CENTRAL PROCESSING UNITS

Downsizing information systems: Framing the issues for the Office of Naval Intelligence (ONI)
[AD-A279888] p 1588 N95-20589

Fault-tolerance in distributed and multiprocessor real-time systems
[AD-A279896] p 1461 N95-20595

Real-time reconfiguration study
[AD-A286060] p 1464 N95-20910

CENTRIFUGING

Modeling platform dynamics and physiological response to short arm centrifugation
[AD-A279640] p 1442 N95-20457

CERAMIC BONDING

Energetics, bonding mechanism and electronic structure of ceramic/ceramic and metal/ceramic interfaces
[DE95-000601] p 1265 N95-20115

CERAMIC MATRIX COMPOSITES

The environmental durability of fiber reinforced ceramic matrix composites
[AD-A283750] p 1225 N95-19919

The effect of fiber coating thickness on the interfacial properties of a continuous fiber ceramic matrix composite
[DE94-017886] p 1267 N95-20373

The processing and mechanical properties of high temperature/high performance composites. Stress redistribution and notch properties, book 2
[AD-A279737] p 1227 N95-20429

The processing and mechanical properties of high temperature/high performance composites. Fatigue and creep, book 3
[AD-A279738] p 1227 N95-20430

The processing and mechanical properties of high temperature/high performance composites. Book 5: Interface effects
[AD-A279815] p 1228 N95-20584

The processing and mechanical properties of high temperature/high performance composites. Mechanism-based constitutive laws and design, book 1
[AD-A279736] p 1228 N95-20801

Fabrication of ceramic composites: Forced CVI
[DE95-001076] p 1271 N95-20821

Micromechanical approach to transformation toughening in ceramics
[PB95-135422] p 1273 N95-20976

Toughened Silcomp composites for gas turbine engine applications
[DE95-002851] p 1214 N95-21243

The processing and mechanical properties of high temperature/high performance composites. Book 6: Delamination and compressive behavior
[AD-A279780] p 1231 N95-21999

A transmission electron microscope characterization of sodium sulfate hot corrosion of silicon carbide fiber-reinforced lithium aluminosilicate glass-ceramic matrix composite
[AD-A286164] p 1231 N95-22038

Structural performance of cylindrical pressure housings of different ceramic compositions under external pressure loading. Part 4: Silicon carbide particulate reinforced alumina ceramic
[AD-A286299] p 1279 N95-22047

High temperature corrosion and crack growth of SiC/SiC at variable oxygen partial pressures
[DE94-018715] p 1232 N95-22115

CERAMICS

Materials for adaptive structural acoustic control, volume 2
[AD-A279222] p 1502 N95-19883

Recognition of subsurface defects in machined ceramics by application of neural networks to laser scatter patterns
[DE94-018373] p 1264 N95-20018

Comparison of the dynamic fatigue behavior of two monolithic SiC and an Al2O3/SiC composite
[DE94-017751] p 1225 N95-20022

Properties of whisker-reinforced ceramics
[DE94-017759] p 1264 N95-20024

Materials/manufacturing element of the Advanced Turbine System Program
[DE94-017299] p 1378 N95-20085

Energetics, bonding mechanism and electronic structure of ceramic/ceramic and metal/ceramic interfaces
[DE95-000601] p 1265 N95-20115

Reactions and microstructure at ceramic/metal interfaces
[DE94-014287] p 1265 N95-20138

Enhancement of creep resistance of a sintered S3N4 ceramic by microwave annealing
[DE94-017698] p 1265 N95-20220

Ceramics formed by pyrolysis of either linear or thermosetting carborane (siloxane or silane) acetylene based precursor polymers
[AD-D016563] p 1266 N95-20291

Microstructural contributions to the fracture resistance of silicon nitride ceramics
[DE94-018955] p 1267 N95-20323

Fracture analysis of an all-ceramic bearing system
[AD-A285056] p 1269 N95-20486

Biomolecular Materials by Design, volume 330
[AD-A285369] p 1269 N95-20551

Structural performance of cylindrical pressure housings of different ceramic compositions under external pressure loading. Part 1: Isostatically pressed alumina ceramic
[AD-A279669] p 1270 N95-20603

Reliability assessment of Multichip Module technologies via the Triservice/NASA RELTECH program
p 1210 N95-20643

Ferroic materials: Design, preparation and characteristics. Ceramic transactions, volume 43
[AD-A285937] p 1270 N95-20664

Effect of fiber fabric orientation on the monotonic and fatigue behavior of a continuous fiber ceramic composite
[DE94-018121] p 1271 N95-20700

Approaches to the design of structural ceramics incorporating whiskers and particulate phases
[DE94-018126] p 1271 N95-20704

Reliability analysis of uniaxially ground brittle materials
[NASA-TM-106852] p 1386 N95-20790

Hg-199 and Cu-(63,65) NMR studies of mercury based high-Tc superconductors
[DE95-001073] p 1570 N95-20820

Experimental investigation of wave and fracture phenomena in impacted ceramics
[AD-A286589] p 1272 N95-20856

Micromechanical approach to transformation toughening in ceramics
[PB95-135422] p 1273 N95-20976

Microstructural design for tough ceramics
[AD-A285634] p 1273 N95-21152

Comparison of properties of sintered and sintered reaction-bonded silicon nitride fabricated by microwave and conventional heating
[DE95-001426] p 1275 N95-21501

The mechanical behavior of surface-modified ceramics
[DE95-001704] p 1276 N95-21572

A study of mechanical processing damage in brittle materials
[DE95-002126] p 1276 N95-21585

Development and applications of flat ceramic membranes
[PB95-110219] p 1276 N95-21650

Forming of superplastic ceramics
[DE94-017306] p 1276 N95-21662

Domain processes in ferroelectric ceramics
[AD-A279567] p 1276 N95-21697

Directional solidification of the alumina-zirconia ceramic eutectic system
[DE95-001677] p 1277 N95-21735

Electronic structure and energies of alkaline earth oxides: MgO, CaO and SrO
[DE94-628990] p 1575 N95-21853

Tailoring suspension flow for the gelcasting of oxide and nonoxide ceramics
[DE95-001351] p 1277 N95-21861

Materials for adaptive structural acoustic controls
[AD-A279255] p 1505 N95-21863

Cost-effective ceramics program in the United States
[DE95-001425] p 1278 N95-21909

Ceramic technology for advanced heat engines
[DE95-000950] p 1278 N95-21937

Characterization equipment for electrooptics and actuators
[AD-A286285] p 1546 N95-22043

Aluminium oxide targets after ballistic impact; fragmentation of the ceramic and the projectile
[PB95-133625] p 1388 N95-22097

Fabrication of PLZT/ITO grating for optical switching and reconfigurable optical interconnect applications
[AD-A286389] p 1548 N95-22248

Materials support for the development of High Temperature Advanced Furnaces (HITAF): A comparison of selected mechanical properties for three SiC-based ceramics
[DE94-017752] p 1280 N95-22258

Measurement of residual stresses on ceramic materials with high spatial resolution
[DE94-017889] p 1280 N95-22270

Structural performance of cylindrical pressure housings of different ceramic compositions under external pressure loading. Part 3: Sintered reaction bonded silicon nitride ceramic
[AD-A285773] p 1388 N95-22411

CEREBELLUM

Biological and theoretical studies of adaptive networks: The conditioned response
[AD-A284781] p 1479 N95-20061

CEREBROSPINAL FLUID

Diffusible driving and coupling signals of the biological clock
[AD-A285353] p 1447 N95-22475

CERENKOV COUNTERS

Inverse Cerenkov laser acceleration experiment at ATF
[DE94-017990] p 1370 N95-20572

Experiments at high energy hadron colliders and underground water Cerenkov detector experiment
[DE95-001804] p 1535 N95-21281

CERENKOV RADIATION

Inverse Cerenkov laser acceleration experiment at ATF
[DE94-017990] p 1370 N95-20572

Experiments at high energy hadron colliders and underground water Cerenkov detector experiment
[DE95-001804] p 1535 N95-21281

CERIUM COMPOUNDS

Kondo insulators
[DE95-001156] p 1237 N95-20368

CERIUM OXIDES

Microwave sintering of ZrO2-12 mol% CeO2
[DE94-018709] p 1265 N95-20226

CERTIFICATION

An evaluation of Automatic Terminal Information Service (ATIS) flight deck display presentation options
[AD-A280100] p 1204 N95-21020

CESIUM

Parity nonconservation in radioactive atoms: An experimental perspective
[DE95-002737] p 1518 N95-21235

Performance of cesium telluride photocathodes as an electron source for the Los Alamos FEL
[DE94-018302] p 1375 N95-21919

CESIUM COMPOUNDS

Application of new synchrotron powder diffraction techniques to anomalous scattering from glasses
[DE94-019285] p 1536 N95-21407

Photocathodes for free electron lasers
[DE94-018305] p 1376 N95-22242

Fabrication and characterization of cesium telluride photocathodes: A promising electron source for the Los Alamos Advanced FEL
[DE94-018303] p 1377 N95-22348

CESIUM ISOTOPES

Parity nonconservation in radioactive atoms: An experimental perspective
[DE95-002737] p 1518 N95-21235

CHALLENGER (ORBITER)

Challenger's night flight
[NASA-TM-110503] p 1217 N95-19995

CHANNEL FLOW

HIVEL2D: A two-dimensional flow model for high-velocity channels
[AD-A286556] p 1341 N95-20843

Simulation of a turbulent flame in a channel
p 1249 N95-21044

Instability of streamwise vortices in plane channel flows p 1344 N95-21049

A Lagrangian dynamic subgrid-scale model turbulence
p 1344 N95-21051

Modeling near wall effects in second moment closures by elliptic relaxation p 1345 N95-21054

Large-eddy simulation of rotating channel flows using a localized dynamic model p 1346 N95-21064

Direct numerical simulation of turbulent flow in a sudden pipe expansion p 1347 N95-21067

Large-eddy simulation of separated flow in a ribbed duct p 1347 N95-21070

A cheap DNS tool for turbulence models testing
p 1348 N95-21072

Large eddy simulation of channel flow using a vorticity transport subgrid model p 1348 N95-21076

Simulations of bypass transition for spatially evolving disturbances p 1349 N95-21079

High temperature superconducting films and multilayers for electronics
[AD-A279545] p 1331 N95-21693

Large-eddy simulation of a plane wake
p 1360 N95-22446

Local dynamic subgrid-scale models in channel flow
p 1360 N95-22447

Large-eddy simulation of flow through a plane, asymmetric diffuser p 1360 N95-22449

Drag reduction strategies p 1361 N95-22453

CHANNELS

Method of making a semiconductor device by forming a nanochannel mask
[AD-D016515] p 1576 N95-22059

CHANNELS (DATA TRANSMISSION)

White-light spectral analysis of lithium niobate waveguides
[DE94-016692] p 1542 N95-20489

Optical backplane for modular avionics
p 1212 N95-20652

EPICS simulation tools for control system development
[DE94-018082] p 1462 N95-20699

DAMSON: A system to measure multipath dispersion, Doppler spread and Doppler shift on multi-mechanism communications channels p 1299 N95-20955

Programmable modular network interface
[AD-D016505] p 1477 N95-21674

CHAOS

Coupled analytic maps
[PB95-111076] p 1498 N95-19945

Semiquantum chaos and the large N expansion
[DE94-016196] p 1488 N95-20169

Chaotic phenomena in plasma 3
[DE94-770765] p 1554 N95-20686

Time-resolved study of sideband generation and transition to chaos on an infrared FEL
[DE95-002336] p 1374 N95-21528

CHARACTERIZATION

Superior catalysts for selective catalytic reduction of nitric oxide
[DE94-018845] p 1234 N95-20046

Performance specifications for technology development: Application for characterization of volatile organic compounds in the environment
[DE94-016627] p 1401 N95-20234

Characterization and simulation of an acoustic source moving through an oceanic waveguide
[AD-A285688] p 1503 N95-20272

Multiple Mechanism Propagation Paths (MMPPs): Their Characterisation and Influence on System Design
[AGARD-CP-543] p 1292 N95-20921

Fiber-optic sensors for rapid, inexpensive characterization of soil and ground water contamination
[DE95-002471] p 1545 N95-21510

CHARGE CARRIERS

Carrier dynamics in InGaAs: Quantum wells versus bulk
[DE94-018205] p 1577 N95-22168

CHARGE COUPLED DEVICES

Visible light emitting materials and injection devices
[AD-A284796] p 1541 N95-20066

Time-resolved diagnostics of excimer laser-generated ablation plasmas used for pulsed laser deposition
[DE94-018950] p 1559 N95-21547

Time resolved x-ray detection
[AD-A279348] p 1368 N95-22143

Vertex detectors at linear colliders: Present and future
[PB95-134656] p 1540 N95-22364

CHARGE DISTRIBUTION

A charge distribution analysis instrument for catalysis and material science applications
[DE94-016489] p 1364 N95-20233

Ion charge-state production and photoionization near the K edge in argon and potassium
[DE95-001443] p 1522 N95-21502

Modeling of nonlinear optic and ESR response of CDW MX materials
[DE94-018301] p 1578 N95-22297

Image solution for poisson's equation in wedge geometry
[PB95-127171] p 1310 N95-22311

CHARGE EXCHANGE

Power balance in D3-D during single-null ELMing H-mode plasmas
[DE94-016680] p 1554 N95-20568

Observation of non diffusive term of toroidal momentum transport in the JFT-2M tokamak
[DE94-770686] p 1555 N95-20989

Muon transfer from muonic atoms of hydrogen isotopes to He nuclei
[DE94-628903] p 1523 N95-21591

Intense proton beam source for ITER neutral-beam spectroscopy diagnostics
[DE94-018092] p 1560 N95-21668

Magnetic interactions in the Emery model
[DE94-629059] p 1577 N95-22181

CHARGE TRANSFER

A portable and independent edge fluctuation diagnostic
[DE94-018254] p 1554 N95-20681

Photoinduced charge transfer between fullerenes and TiO2 semiconductor colloids
[DE95-001447] p 1570 N95-20838

Quantum simulation of heterogeneous electron transfer free energies at the water-metal interface
[AD-A279279] p 1522 N95-21492

Ultrafast optical studies of surface reaction processes at semiconductor interfaces
[DE95-001548] p 1574 N95-21839

Quantum chemical study of rare gas/halide interactions as a model for high energy density material. 2: The interaction of hydrogen chloride with the rare gas xenon
[AD-A286385] p 1248 N95-22321

Resonant charge transfer in hyperthermal atomic and molecular ion-surface collisions
[AD-A284937] p 1530 N95-22471

CHARGE TRANSFER DEVICES

CTD calibration and processing methods used at Woods Hole Oceanographic Institution
[AD-A279507] p 1435 N95-21681

CHARGED PARTICLES

Modeling the dynamics of charged-particle beams using a Fokker-Planck approach
[DE95-001458] p 1531 N95-19983

ALT-2 armor tile design for upgraded TEXTOR operation
[DE94-015749] p 1549 N95-20143

GAJET experiment at the LHC: The GAJET collaboration
[PB95-129813] p 1512 N95-20454

Current diffusive ballooning mode in second stability region of tokamaks
[DE94-770690] p 1554 N95-20683

Simulation of tearing mode stabilization by using ECH
[DE94-770700] p 1554 N95-20684

Magnetic flocculation of paramagnetic particles
[DE94-018144] p 1501 N95-20725

Ion heat pulse after sawtooth crash in the JFT-2M tokamak
[DE94-770685] p 1555 N95-20988

Observation of non diffusive term of toroidal momentum transport in the JFT-2M tokamak
[DE94-770686] p 1555 N95-20989

Experimental measurements and modeling of impurity transport in the divertor and boundary plasma of D3-D
[DE94-016519] p 1556 N95-21159

Anomalous vector-boson couplings in Majorana neutrino models
[PB95-127460] p 1518 N95-21220

Where are we going with Bose-Einstein: A mini review
[PB95-130308] p 1518 N95-21222

Theory of the L-H transition
[DE95-001389] p 1558 N95-21299

Cluster reactions: An approach to understanding the fundamentals of heterogeneous catalysis
[DE95-002947] p 1243 N95-21447

Monopoles and quark confinement: Introduction and overview
[DE94-019348] p 1522 N95-21485

Structure functions and structure function ratio F2(n)/F2(p) at low X(Bj) and Q2 in inelastic muon scattering
[DE94-018979] p 1573 N95-21561

Classical-quantum correspondence for ionization in fast ion-atom collisions
[DE95-000953] p 1526 N95-21940

Theses of the Proceedings of the 23d International Meeting on the Physics of Charged Particle Interaction with Crystals
[DE94-631501] p 1529 N95-22281

Experimental study of interactions of highly charged ions with atoms at keV energies
[DE94-018648] p 1529 N95-22316

CHARM (PARTICLE PHYSICS)

J/psi,psi(prime) yields mu(+)mu(-) and B yields J/psi,psi(prime) cross sections
[DE94-017184] p 1507 N95-20108

A tau-charm-factory at Argonne
[DE94-016913] p 1510 N95-20360

Triggers for a high sensitivity charm experiment
[DE95-002251] p 1515 N95-20868

Charmonium production, b quark and B meson production and b(bar b) correlations at CDF
[DE95-002525] p 1515 N95-20898

A high-rate fixed-target charm experiment
[DE95-001767] p 1521 N95-21378

Polarization of charmonium in pion-nucleus collisions
[DE95-002783] p 1523 N95-21525

Measurement of the B cross section at CDF via B semileptonic decays
[DE95-002217] p 1524 N95-21597

Strong interactions studies with medium energy probes
[DE95-001800] p 1245 N95-21745

Beam flavor dependence in the hadroproduction of D(+-) and D(sub s)(+-) mesons
[DE94-015541] p 1530 N95-22339

CHARPY IMPACT TEST

The production of calibration specimens for impact testing of subsize Charpy specimens
[DE94-018125] p 1386 N95-20703

Impact behavior of FeAl alloy FA-350
[DE94-018128] p 1254 N95-20705

Effect of neutron irradiation on the impact properties of A533B steel
[DE95-001834] p 1256 N95-21286
Perimeter-yardstick technique for fracture surface fractal analysis
[AD-A286240] p 1387 N95-22025

CHARTS
Common mapping system media study
[AD-A279086] p 1390 N95-21912
The use of fuzzy set classification for pattern recognition of the polygraph
[AD-A279148] p 1470 N95-21971

CHEMICAL ANALYSIS
Experimental investigation of PIC formation during the incineration of recovered CFC-11
[PB94-214772] p 1401 N95-20192
Performance specifications for technology development: Application for characterization of volatile organic compounds in the environment
[DE94-016627] p 1401 N95-20234
ALCHEMI of Fe-doped B2-ordered NiAl alloys with different doping levels
[DE94-017748] p 1255 N95-20907
Methodology for ESCA analysis of electromigration
[AD-A286229] p 1241 N95-21168
An Echelle Grating Spectrometer (EGS) for mid-IR remote chemical detection
[DE94-019310] p 1367 N95-21478
Studies of selenium and xenon in inductively coupled plasma mass spectrometry
[DE95-001676] p 1245 N95-21734

CHEMICAL ATTACK
Evaluation of stress experienced by soldiers wearing chemical protective clothing during varying work loads in desert or tropical environments
[AD-A280113] p 1452 N95-20625

CHEMICAL BONDS
Energetics, bonding mechanism and electronic structure of ceramic/ceramic and metal/ceramic interfaces
[DE95-000601] p 1265 N95-20115
Photochemistry of intermolecular C-H bond activation reactions
[DE94-018417] p 1239 N95-20682
Electronic structure and relative stability of icosahedral superatoms in Al-transition-metal alloys
[DE94-628996] p 1260 N95-21855
Embedded optical fibres as strain sensors in polymer matrix fibre composites: The influence of adhesion in strain transfer
[PB95-133617] p 1547 N95-22140

CHEMICAL CLEANING
Guidelines for qualifying cleaning and verification materials
[NASA-TM-108474] p 1270 N95-20694
A new universal solution for the electrofinishing of metallic materials
[DE95-001681] p 1258 N95-21568

CHEMICAL COMPOSITION
Chemical Structure and Dynamics program
[DE95-001117] p 1403 N95-20834
Gradient index lenses from sol-gel layering
[AD-A285649] p 1242 N95-21402
D/H ratios and H2O contents of mantle-derived amphibole megacrysts from Dish Hill, California
p 1416 N95-21781

CHEMICAL COMPOUNDS
Selection of substances to be considered in the environmental balance/environmental outlook in relation to the dissemination theme
[PB95-132197] p 1407 N95-21635

CHEMICAL EFFECTS
Nitrogen control of chloroplast differentiation
[DE95-002797] p 1439 N95-21526

CHEMICAL ENERGY
Research in the chemical sciences: Summaries of FY 1994
[DE94-015427] p 1223 N95-20264

CHEMICAL ENGINEERING
Research in the chemical sciences: Summaries of FY 1994
[DE94-015427] p 1223 N95-20264
. Initial assessment of the hazards and risks of new chemicals to man and the environment, part 2
[PB95-106407] p 1410 N95-22124
Hydrothermal conversion of carbohydrates and related compounds
[PB95-134011] p 1396 N95-22175

CHEMICAL EQUILIBRIUM
Computer program for calculation of complex chemical equilibrium compositions and applications. Part 1: Analysis
[NASA-RP-1311] p 1235 N95-20180

CHEMICAL LASERS
Chemical lasers emitting in the visible spectrum: Metastable oxygen reactions and YOSHIDA laser
[PB95-104485] p 1372 N95-20983

CHEMICAL PROPERTIES
Monitoring bioremediation of Volatile Organic Compounds (VOCs) using Fourier Transform Infrared (FT-IR) spectrometry
[AD-A279631] p 1403 N95-20456
Nonlinear spectroscopy of multicomponent droplets and two- and three-dimensional measurements in flames
[AD-A279945] p 1238 N95-20581
An initial assessment of the properties of 2,5-dipicryl-1,3,4-oxadiazole: A secondary explosive with high thermal stability
[MRL-TR-93-16] p 1284 N95-21624

CHEMICAL REACTIONS
Chemical and electrochemical interactions on corroding metal surfaces
[DE95-000624] p 1250 N95-19979
Plasma chemistry of vibrationally nonequilibrium molecules
[AD-A279630] p 1553 N95-20411
An atomically-resolved STM study of the thermal decomposition of disilane on Si(001)
[AD-A279818] p 1567 N95-20544
Chemically modified electrodes
[AD-A279821] p 1324 N95-20587
Publications/patents/presentations/honors/student eport. Investigation of the role of vibrational excitation in unimolecular reactions
[AD-A280044] p 1513 N95-20621
Cross-linking reactions for the conversion of polyphosphazenes into useful materials
[AD-A279696] p 1271 N95-20709
An improved and facile method for the synthesis of 1,1-bis(4-hydroxyphenyl) 2-phenylethylene and its derivatives
[DE95-001125] p 1240 N95-20836
Assessment of database for interaction of tritium with ITER plasma facing materials
[DE95-002038] p 1558 N95-21290
Production of S2F10, S2OF10 and S2O2F10 by spark discharges in SF6*
[DE95-001421] p 1243 N95-21500
Fiber-optic sensors for rapid, inexpensive characterization of soil and ground water contamination
[DE95-002471] p 1545 N95-21510
Single-collision studies of energy transfer and chemical reaction
[DE95-002943] p 1244 N95-21517
The energetics and dynamics of free radicals, ions, and clusters
[DE94-018101] p 1244 N95-21701
Restricted mass transport effects on free radical reactions
[DE94-018136] p 1217 N95-21706
Chemical interactions between protein molecules and polymer membrane materials
[DE95-001808] p 1224 N95-21746
Selenophene transition metal complexes
[DE95-001675] p 1260 N95-21841
A catalytic method for the conversion of silanes to stannanes
[AD-A286214] p 1247 N95-22020
Synthesis and structure of a novel bis-stibole
[AD-A286345] p 1224 N95-22252
Applications of sonochemistry
[AD-A286388] p 1506 N95-22360

CHEMICAL REACTORS
Catalytic reactions of synthesis gas. Part 3. Determination of reaction kinetics
[PB95-127759] p 1248 N95-22329

CHEMICAL VAPOR INFILTRATION
Scale-up and modeling of forced chemical vapor infiltration
[DE94-017769] p 1340 N95-20781
Fabrication of ceramic composites: Forced CVI
[DE95-001076] p 1271 N95-20821

CHEMILUMINESCENCE
Compatibility testing of explosives and paints by chemiluminescence techniques
[PB95-133609] p 1275 N95-21275

CHEMISORPTION
Hydrogenation of nitriles on a well-characterized nickel surface: From surface science studies to liquid phase catalytic activity measurements
[DE94-018184] p 1259 N95-21707

CHIPS
Packaging the MAMA module p 1209 N95-20639
MCMs for avionics: Technology selection and intermodule interconnection p 1210 N95-20641
Reliability assessment of Multichip Module technologies via the Triservice/NASA RELTECH program
p 1210 N95-20643
Assuring Known Good Die (KGD) for reliable, cost effective MCMs p 1210 N95-20644

CHIPS (ELECTRONICS)
Materials research for GHz multi-chip modules
[AD-A279661] p 1227 N95-20412
Materials processing and manufacturing technologies for diamond substrates multichip modules
[AD-A285060] p 1315 N95-20488
The design and manufacturing development of an active silicon substrate MCM p 1211 N95-20645
High performance YBCO films
[AD-A286567] p 1326 N95-20824
Monolithic circuits for lead-glass calorimetry
[DE94-019112] p 1330 N95-21554
Non-linear A/D converters for integrated silicon smart sensors
[PB94-208402] p 1330 N95-21590
Design and development SAWAFE peak detector chip
[DE95-001745] p 1332 N95-21742
Consortia for Known Good Die (KGD), phase 1
[AD-A279407] p 1383 N95-21933
Radiation characterization report for the GPS Receiver microcontroller chip
[DE94-019169] p 1335 N95-22165
Radiation tests on service electronics for future multi TeV detectors
[DE94-632822] p 1335 N95-22184
Design of the readout IC for the CDF SVX-2 silicon strip detector
[DE95-000562] p 1539 N95-22193

CHIRAL DYNAMICS
Dynamics of the chiral transition
[DE94-016813] p 1524 N95-21641

CHIRALITY
Chiral symmetry and lattice gauge theory
[DE94-018676] p 1564 N95-20130
The paradigm of Pseudodual Chiral Models
[DE94-016386] p 1579 N95-20271
Biaxiality of chiral liquid crystals
[DE94-629032] p 1578 N95-22277

CHLORIDES
Effect of external stress on the transport of fluids in thermoplastic resin systems
[AD-A279993] p 1270 N95-20596
Modeling of nonlinear optic and ESR response of CDW MX materials
[DE94-018301] p 1578 N95-22297
Quantum chemical study of rare gas/halide interactions as a model for high energy density material. 2: The interaction of hydrogen chloride with the rare gas xenon
[AD-A286385] p 1248 N95-22321

CHLORINE
Experimental investigation of PIC formation during the incineration of recovered CFC-11
[PB94-214772] p 1401 N95-20192
Tests of dielectric model descriptions of chemical charge displacements in water
[DE94-007530] p 1236 N95-20277
Radiative forcing calculations for CH3Cl
[DE94-019018] p 1402 N95-20355
Has a standard model solution to the solar neutrino problem been found?
[DE94-017580] p 1604 N95-20490
Noble gas isotopes and halogens in volatile-rich inclusions in diamonds p 1417 N95-21784
Effects of increased UV-B radiation on phytoplankton: A preliminary study and research programme
[PB95-133732] p 1439 N95-21884

CHLORINE FLUORIDES
Launch safety, toxicity, and environmental effects of the high performance oxidizer ClF(5)
[AD-A286095] p 1284 N95-22227

CHLOROFLUOROCARBONS
Accelerated screening methods for determining chemical and thermal stability of refrigerant-lubricant mixtures. Part 2: Experimental comparisons and verification of methods
[DE95-000743] p 1264 N95-20078
Experimental investigation of PIC formation during the incineration of recovered CFC-11
[PB94-214772] p 1401 N95-20192
The development and evaluation of water-mist fire extinguishing systems
[DE94-019019] p 1286 N95-20356
New concepts for refrigerant leak detection and mixture measurement
[DE94-018967] p 1287 N95-21559
Materials compatibility and lubricants research on CFC-refrigerant substitutes
[DE94-018414] p 1287 N95-21631
Ozone-depleting-substance control and phase-out plan
[DE95-001647] p 1409 N95-21722

CHLOROFORM
Effect of external stress on the transport of fluids in thermoplastic resin systems
[AD-A279993] p 1270 N95-20596

CHLOROPHYLLS
Nitrogen control of chloroplast differentiation
[DE95-002797] p 1439 N95-21526

CHLOROPLASTS
Nitrogen control of chloroplast differentiation
[DE95-002797] p 1439 N95-21526

CHOLESTEROL
The influence of coronary artery disease on +Gz tolerance: A preliminary study
[AD-A279305] p 1446 N95-21941

CHONDRITES
Transportation of volatile elements in thermally evolving planetesimals: An important role of metallic iron
p 1418 N95-21790
Solubilities of nitrogen and noble gases in basalt melt
p 1422 N95-21807
Comets, impacts, and atmospheres
p 1422 N95-21810

CHROMIUM
Modelocking and waveguide amplifiers using Cr:Forsterite and Cr:YAG
[AD-A285857] p 1369 N95-20378
Electrochemical impedance spectroscopy of trivalent chromium pre-treated aluminum alloy
[AD-A280093] p 1240 N95-20970
Nitrogen alloyed martensitic steels
[PB95-127791] p 1255 N95-21128

CHROMIUM ALLOYS
Cr2Nb development
[DE94-018697] p 1250 N95-20043
Microstructures and tensile properties of as-cast iron-aluminide alloys
[DE94-017868] p 1252 N95-20359
Electrochemical impedance spectroscopy of trivalent chromium pre-treated aluminum alloy
[AD-A280093] p 1240 N95-20970
Metastable bcc phase formation in the Nb-Cr-Ti system
[DE94-016212] p 1255 N95-21137
Computational modeling of diffusion-controlled transformations in ternary systems
[DE95-001358] p 1256 N95-21298
Incology alloy 908 data handbook
[DE95-001818] p 1260 N95-22013

CHROMIUM COMPOUNDS
Evaluation of Pd-Cr wires for strain gage application
[NASA-TM-106857] p 1366 N95-21259
Dynamic NMR studies of restricted arene rotation in the chromiu tricarbonyl thiophene and selenophene complexes
[DE95-001656] p 1257 N95-21399

CHROMIUM ISOTOPES
An investigation of the applicability of the new ion exchange resin, Reillex(TM)-HPQ, in ATW separations
[DE94-016576] p 1274 N95-21234

CHROMIUM OXIDES
Selective methane oxidation over promoted oxide catalysts
[DE94-012270] p 1235 N95-20188
Classification of bianisotropic media
[PB95-127635] p 1502 N95-21102

CHROMOPHORES
Design, synthesis and characterization of novel nonlinear optical materials
[AD-A285617] p 1540 N95-19897
Photodegradation and photophysics of laser dyes
[AD-A285105] p 1368 N95-20063
High temperature polymer for second order nonlinear optics for photonic materials
[AD-A279309] p 1280 N95-22141

CHUTES
Corrosion evaluation of fuel canister crusher rigging
[DE95-002962] p 1257 N95-21452

CIRCLES (GEOMETRY)
Coupled analytic maps
[PB95-111076] p 1498 N95-19945
An exact enumeration of self-avoiding loops on a square lattice
[DE94-628999] p 1578 N95-22276
Local connectivity of some Julia sets containing a circle with an irrational rotation
[PB95-109070] p 1496 N95-22353

CIRCUIT BOARDS
High performance hardware and software for pattern recognition and image processing
[AD-A279776] p 1457 N95-19961
Module cooling system
[AD-D016584] p 1315 N95-20436
An automatic placement tool for rapid prototyping of printed circuit boards
[AD-A286029] p 1328 N95-20997

CIRCUIT RELIABILITY
The reliability of laser reflowed Sn-Ag solder joints
[AD-A279787] p 1315 N95-20443

CIRCUITS
Evaluation of superconducting quantum interference devices interfaced with digital signal processing electronics for biomagnetic applications
[DE94-016186] p 1269 N95-20164
A charge distribution analysis instrument for catalysis and material science applications
[DE94-016489] p 1364 N95-20233
Prototype rule-based reliability analysis for VLSI circuit design
[AD-A280065] p 1327 N95-20967
Circuit means for providing compatibility between two separate digital data interfaces
[AD-D016225] p 1455 N95-21116
Quartz resonator fluid monitors for vehicle applications
[DE94-018910] p 1367 N95-21546
SEU and SEL response of the Westinghouse 64K E-2PROM, analog devices AD7876 12-bit ADC, and the Intel 82527 Serial Communications Controller
[DE95-003349] p 1334 N95-22086

CIRCULAR CYLINDERS
Research on bluff body vortex wakes
[AD-A286319] p 1200 N95-20177
The velocity and vorticity fields of the turbulent near wake of a circular cylinder
[NASA-TM-110513] p 1355 N95-21954

CIRCULAR POLARIZATION
A structural determination using magnetic x ray circular dichroism in spin-polarized photoelectron diffraction
[DE94-017528] p 1567 N95-20449
Magnetic x-ray circular dichroism in spin-polarized photoelectron diffraction
[DE95-002394] p 1520 N95-21360
Analysis of a microstrip reflectarray antenna for microspacecraft applications p 1305 N95-21541
Electric-field effects on shallow donor impurity in a harmonic quantum dot
[DE94-629034] p 1577 N95-22176

CIRCULAR WAVEGUIDES
Analysis of a disk-on-rod surface wave element inside a corrugated horn using the mode-matching technique
p 1305 N95-21543
Improved broadband waveguide pressure window
[AD-D016487] p 1306 N95-21834

CIRCULATION
Numerical modeling of a small recirculating induction accelerator for heavy-ion fusion
[DE94-018549] p 1552 N95-20318

CITIES
Propagation of high frequency waves in urban and road tunnel environments p 1294 N95-20933
Environmental cleanup: Too many high priority sites impede DOD's program. Report to the Chairman, Committee on Governmental Affairs, US Senate
[AD-A279511] p 1407 N95-21683
Urban air carcinogens and their effects on health
[DE95-002259] p 1447 N95-22285
Current concepts on airborne particles and health
[DE95-002260] p 1447 N95-22287

CIVIL AVIATION
Census US civil aircraft calendar year 1993
[AD-A286309] p 1199 N95-20091
Test and evaluation report for the Manual Domestic Passive Profiling System (MDPPS)
[AD-A286312] p 1202 N95-20093

CLAMPS
The effect of fiber coating thickness on the interfacial properties of a continuous fiber ceramic matrix composite
[DE94-017886] p 1267 N95-20373

CLASSIFICATIONS
Hierarchical diagrammatic representation of class structure
[PB95-110722] p 1456 N95-19908
Classification of diagonal coset modular invariants
[PB95-111118] p 1489 N95-20259
Modeling and identification of parallel and feedback nonlinear systems
[DE95-001006] p 1481 N95-20812
Classification of bianisotropic media
[PB95-127635] p 1502 N95-21102
Magnetoelectric properties of reciprocal bianisotropic materials with focus on the polarizability of chiro-omega spheres
[PB95-127650] p 1544 N95-21103
The use of fuzzy set classification for pattern recognition of the polygraph
[AD-A279148] p 1470 N95-21971

CLASSIFIERS
Innovative use of DSP technology in space: FORTE event classifier
[DE94-016086] p 1291 N95-20697

CLASSIFYING
Guidelines for qualifying cleaning and verification materials
[NASA-TM-108474] p 1270 N95-20694

CLEAN FUELS
The Carnol process for methanol production and utilization with reduced CO2 emissions
[DE94-016808] p 1283 N95-21211

CLEANERS
Guidelines for qualifying cleaning and verification materials
[NASA-TM-108474] p 1270 N95-20694

CLEANING
Mercury capture in bench-scale absorbers
[DE94-016910] p 1234 N95-20107
Natural gas cleanup: Evaluation of a molecular sieve carbon as a pressure swing adsorbent for the separation of methane/nitrogen mixtures
[DE94-012263] p 1234 N95-20135
Environmental cleanup technology transfer initiatives
[AD-A285059] p 1403 N95-20487
Ceramem filters for removal of particles from hot gas streams
[DE95-001976] p 1275 N95-21354
Environmental cleanup: Too many high priority sites impede DOD's program. Report to the Chairman, Committee on Governmental Affairs, US Senate
[AD-A279511] p 1407 N95-21683

CLIMATE
Monsoons: AMIP simulations of the 1987 and 1988 drought and flood regimes
[DE94-014789] p 1428 N95-20140
Lidar technologies for airborne and space-based applications
[DE95-002954] p 1302 N95-21448

CLIMATE CHANGE
Dust Bowl migration as an analog for possible global warming-induced migration from Mexico
[DE94-017472] p 1401 N95-20089
Site Scientific Mission Plan for the Southern Great Plains CART site, July - December 1994
[DE94-017289] p 1401 N95-20193
Workshop on Uncertainty and Global Climate Change Research
[DE94-016728] p 1401 N95-20238
Daytime Raman lidar profiling of atmospheric water vapor
[DE94-015747] p 1413 N95-20397
Global change integrating factors: Tropical tropopause trends
[DE95-001121] p 1404 N95-20835
Definition report on environmental indices in future environmental assessments environmental balance/environmental outlook
[PB95-131876] p 1405 N95-21350
Sensitivity of climate models: Comparison of simulated and observed patterns for past climates
[DE95-002257] p 1406 N95-21379
Monitoring the response of the upper troposphere/lower stratosphere to a greenhouse gas scenario
[DE95-000982] p 1406 N95-21410
Modeling the response of the California Current system to Global Greenhouse Warming
[DE94-018253] p 1408 N95-21708
Proceedings: International Symposium on Global Change (IGBP)
[DE94-765351] p 1410 N95-22219

CLIMATE MODELS
Workshop on Uncertainty and Global Climate Change Research
[DE94-016728] p 1401 N95-20238
Sensitivity of climate models: Comparison of simulated and observed patterns for past climates
[DE95-002257] p 1406 N95-21379
The message passing version of the parallel Community Climate Model
[DE94-019158] p 1407 N95-21608
Confirmatory analysis of SAGE-1, and -2 data
[DE95-003623] p 1427 N95-22240

CLIMATOLOGY
The initiation of lightning and the growth of electric fields in thunderstorms
[AD-A280033] p 1428 N95-20008
Workshop on Uncertainty and Global Climate Change Research
[DE94-016728] p 1401 N95-20238
Global change integrating factors: Tropical tropopause trends
[DE95-001121] p 1404 N95-20835
Proceedings: International Symposium on Global Change (IGBP)
[DE94-765351] p 1410 N95-22219
Climatological data for clouds over the globe from surface observations, 1982-1991: The total cloud edition
[DE95-002537] p 1431 N95-22288

CLIMBING FLIGHT
Acoustic climb to cruise test
[NASA-TM-110504] p 1206 N95-20155

CLINICAL MEDICINE
Environmental Hazards Assessment Program
[DE94-019075] p 1406 N95-21565

CLOSTRIDIUM
Microbiology and physiology of anaerobic fermentations of cellulose
[DE95-002899] p 1438 N95-20917
CLOSURE LAW
Mapping closures for turbulent combustion
[AD-A279995] p 1238 N95-20597
CLOSURES
Evaluation of Reynolds stress turbulence closures in compressible homogeneous shear flow
[NASA-CR-194892] p 1338 N95-20009
CLOTHING
Governing equations for multiphase heat and mass transfer in hygroscopic porous media with applications to clothing materials
[AD-A286418] p 1357 N95-22206
CLOTTING
Preclinical investigation of lyophilized platelet preparations
[AD-A286079] p 1443 N95-20851
CLOUD COVER
Completion of spectral rotating shadowband radiometers and analysis of ARM spectral short-wave data
[DE95-000602] p 1412 N95-20116
Proceedings of the Cloud Impacts on DOD Operations and Systems 1993 Conference (CIDOS 1993)
[AD-A286658] p 1430 N95-20974
Climatological data for clouds over the globe from surface observations, 1982-1991: The total cloud edition
[DE95-002537] p 1431 N95-22288
CLOUD DISPERSAL
Site Scientific Mission Plan for the Southern Great Plains CART site, July - December 1994
[DE94-017289] p 1401 N95-20193
CLOUD PHYSICS
Effects of microphysics and radiation on mesoscale processes of a midlatitude squall line
[DE94-014732] p 1429 N95-20381
Proceedings of the Cloud Impacts on DOD Operations and Systems 1993 Conference (CIDOS 1993)
[AD-A286658] p 1430 N95-20974
An integrated cloud observation and modeling investigation in support of the ARM Program
[DE95-002798] p 1430 N95-21527
CLOUDS (METEOROLOGY)
Site Scientific Mission Plan for the Southern Great Plains CART site, July - December 1994
[DE94-017289] p 1401 N95-20193
An integrated cloud observation and modeling investigation in support of the ARM Program
[DE95-002798] p 1430 N95-21527
CLUSTER ANALYSIS
An empirical approach to logical clustering of software failure regions
[AD-A279863] p 1462 N95-20776
Saddle-node dynamics for edge detection
[DE94-017415] p 1473 N95-22426
CLUTTER
Detection optimization using linear systems analysis of a coded aperture laser sensor system
[DE95-001112] p 1371 N95-20832
Modelling of microwave propagation and clutter in a maritime environment p 1295 N95-20938
Large bistatic angle clutter depolarization study
p 1296 N95-20941
The effects of multihop HF propagation on the performance of OTH backscatter radars
p 1298 N95-20953
Classical analysis methods for designing and developing downlooking radars
[AD-A285760] p 1302 N95-21405
Probability of detection for a GO CFAR radar processor using envelope detection approximation
[AD-A286211] p 1310 N95-22251
Effect of cell size on elliptically polarized radar clutter statistics
[AD-A285789] p 1311 N95-22401
CMOS
Design of a 10 bit 10k Samples/s low power CMOS ADC
[PB95-110425] p 1455 N95-22018
Defect classes: An overdue paradigm for CMOS IC testing
[DE94-018905] p 1334 N95-22118
Radiation characterization report for the GPS Receiver microcontroller chip
[DE94-019169] p 1335 N95-22165
Design of the readout IC for the CDF SVX-2 silicon strip detector
[DE95-000562] p 1539 N95-22193
COAGULATION
Preclinical investigation of lyophilized platelet preparations
[AD-A286079] p 1443 N95-20851
COAL
Technology development for cobalt F-T catalysts
[DE94-017363] p 1241 N95-21172
Ceramem filters for removal of particles from hot gas streams
[DE95-001976] p 1275 N95-21354
Restricted mass transport effects on free radical reactions
[DE94-018136] p 1217 N95-21706
COAL DERIVED GASES
Bioconversion of coal derived synthesis gas to liquid fuels
[DE94-017381] p 1282 N95-19927
Bioconversion of coal derived synthesis gas to liquid fuels
[DE94-018849] p 1314 N95-20339
COAL DERIVED LIQUIDS
Lower active metals loading for hydrotreating catalysts
[DE94-018907] p 1261 N95-22119
COAL GASIFICATION
Energy impacts of controlling carbon dioxide emissions from an integrated gasification/combined-cycle system
[DE94-016878] p 1403 N95-20478
COAL LIQUEFACTION
Intrinsic barriers for H-atom transfer reactions
[DE94-018914] p 1507 N95-20049
COALESCING
Relativistic binary neutron star coalescence
[DE94-019311] p 1600 N95-21479
COANDA EFFECT
Static investigation of two fluidic thrust-vectoring concepts on a two-dimensional convergent-divergent nozzle
[NASA-TM-4574] p 1199 N95-19913
COASTAL CURRENTS
A numerical study of wind forcing effects on the California Current System
[AD-A286205] p 1435 N95-21880
COASTAL ECOLOGY
Closure on the global carbon cycle
[DE94-018617] p 1404 N95-20991
COASTAL WATER
AN/APS-137 Forward Looking Airborne Radar (FLAR) evaluation, Fall 1992 experiment
[AD-A279526] p 1306 N95-21686
COASTS
Long Time Series Measurements in the Coastal Ocean: A workshop
[AD-A279509] p 1435 N95-21682
AN/APS-137 Forward Looking Airborne Radar (FLAR) evaluation, Fall 1992 experiment
[AD-A279526] p 1306 N95-21686
COATING
The effect of fiber coating thickness on the interfacial properties of a continuous fiber ceramic matrix composite
[DE94-017886] p 1267 N95-20373
Qualification test results for blue-red reflecting solar covers p 1320 N95-20525
Electrochemical impedance spectroscopy of trivalent chromium pre-treated aluminum alloy
[AD-A280093] p 1240 N95-20970
Aircraft corrosion study
[AD-A279527] p 1259 N95-21687
Aligned bismuth, strontium, calcium cuprate coatings on polycrystalline substrates
[AD-D016512] p 1278 N95-21907
COATINGS
The thermal conductivity of carbon coated silicon carbide fibers embedded in a silicon carbide matrix
[DE94-017758] p 1225 N95-20023
Method of making copper-titanium nitride alloy
[AD-D016582] p 1252 N95-20201
UV testing of INTELSAT-7, 7A, and 8 solar cells
p 1320 N95-20526
Boron carbide-based coatings on graphite for plasma facing components
[DE94-017976] p 1269 N95-20570
Aircraft corrosion study
[AD-A279527] p 1259 N95-21687
Protective organic coatings on steel: Accelerated corrosion test method for paint/coatings exposed to water with low conductivity. Nordtest project no. 1010-92. Degradation of organic coatings in fresh water
[PB95-134185] p 1277 N95-21873
Surface technology programme
[PB95-132866] p 1262 N95-22174
Reflective masks for extreme ultraviolet lithography
[DE95-003427] p 1336 N95-22236
Measurement of the thermal properties of electrically conducting fluids using coated transient hot wires
[DE94-017816] p 1357 N95-22264
Defect geometries and laser-induced damage in multilayer coatings
[DE94-017695] p 1377 N95-22343
Accelerated life testing of solar energy materials: Case study of some selective solar absorber coating materials for DHW systems. A report of task 10 solar materials research and development
[PB95-132411] p 1397 N95-22362
COAXIAL CABLES
Proceedings of the International Wire and Cable Symposium
[AD-A279242] p 1403 N95-20465
Analysis of a disk-on-rod surface wave element inside a corrugated horn using the mode-matching technique
p 1305 N95-21543
Current distribution in Cable-In-Conduit Conductors
[DE95-001820] p 1332 N95-21725
Passive surface deployed variable inductance wire antenna statement of government interest
[AD-D016210] p 1307 N95-21910
COBALT
Investigation of syngas interaction in alcohol synthesis catalysts
[DE94-018784] p 1236 N95-20349
Magnetic x ray circular dichroism in Fe Co Pt multilayers
[DE94-017522] p 1253 N95-20447
COBALT ALLOYS
Cr2Nb development
[DE94-018697] p 1250 N95-20043
Hydrogen resistant alloy - NASA 23
[NASA-CASE-MFS-26200-1-SB] p 1251 N95-20068
Giant magnetoresistance calculated from first principles
[DE94-018658] p 1500 N95-20129
Consequences of oscillatory potentials and angular forces in transition metals and their aluminides
[DE94-019127] p 1258 N95-21600
COBALT COMPOUNDS
Technology development for cobalt F-T catalysts
[DE94-017363] p 1241 N95-21172
COCKPITS
Crew-Centered Cockpit Design (CCCD) field demonstration program, volume 1
[AD-A286426] p 1453 N95-21566
The advanced technology crew station: Development and validation of a workload assessment technique for cockpit function allocation
[AD-A279544] p 1453 N95-21691
CODE DIVISION MULTIPLE ACCESS
CDMA with interference cancellation for multiprobe missions p 1304 N95-21536
CODERS
A method to determine the kinematics of the lower limbs of a subject pedaling a bicycle using encoders and accelerometers
[NASA-CR-197401] p 1453 N95-21866
CODES
Time code interface
[AD-D016535] p 1501 N95-20731
CODING
Detection optimization using linear systems analysis of a coded aperture laser sensor system
[DE95-001112] p 1371 N95-20832
Expressions that talk about themselves
[PB95-134060] p 1466 N95-21344
Proposal for a tutorial on Minimal Length Encoding (MLE) in molecular biology
[DE94-015076] p 1438 N95-21376
Subsampling methods for image sequence coding
[PB95-107991] p 1305 N95-21579
Image and video coding using a wavelet decomposition
[PB95-135067] p 1311 N95-22358
COEFFICIENT OF FRICTION
The effect of fiber coating thickness on the interfacial properties of a continuous fiber ceramic matrix composite
[DE94-017886] p 1267 N95-20373
On the origins and modeling of frictional behavior in interfacially-complex sliding contacts
[DE94-019129] p 1381 N95-21601
COEFFICIENTS
Development of ferroelectric liquid crystals with enhanced nonlinear optical properties
[AD-A279988] p 1571 N95-20965
Collisional redistribution effects on x ray laser saturation behavior
[DE94-017308] p 1374 N95-21663
COGNITION
A database for analyzing sequential behavioral data and their associated cognitive models
[AD-A280061] p 1448 N95-19887
COGNITIVE PSYCHOLOGY
MAC/FAC: A model of similarity-based retrieval
[AD-A286291] p 1450 N95-22052

COHERENT RADIATION
Instantaneous frequency dynamics of coherent emission from magnetoexcitons in gallium arsenide
[DE94-018182] p 1569 N95-20677
Coherence properties of high order harmonic radiation
[DE94-016974] p 1377 N95-22312
COHERENT SCATTERING
X-band microwave backscattering from ocean waves
[DE94-016719] p 1309 N95-22241
COHESION
Dielectric models in adhesion and extrapolations of molecular modeling
[AD-A279675] p 1516 N95-21121
COILS
The calculation and measurement of Helmholtz coil fields
[AD-A286081] p 1228 N95-20808
COLD PLASMAS
Plasma model for charging damage
[DE95-000788] p 1558 N95-21310
On the theory of strong electromagnetic waves propagation in an electron-positron-ion plasma
[DE94-628964] p 1561 N95-21850
Large amplitude localized structures in a relativistic electron-positron ion plasma
[DE94-628965] p 1561 N95-21851
Observations of cold magnetospheric ions at geosynchronous orbit during times of high activity
[DE95-000936] p 1600 N95-21935
COLD TOLERANCE
Thermal resistance of the cheek in cold air
[AD-A286257] p 1446 N95-22001
COLD WEATHER TESTS
Cold regions instrumentation considerations
[AD-A279492] p 1367 N95-21680
Thermal resistance of the cheek in cold air
[AD-A286257] p 1446 N95-22001
COLLECTION
Parasitic current collection by solar arrays in LEO
p 1321 N95-20527
COLLIMATORS
Fiber-optic rotary joint with bundle collimator assemblies
[AD-D016504] p 1545 N95-21673
Unique microchannel plate process doubles MCPI resolution
[DE94-017507] p 1337 N95-22427
COLLISION AVOIDANCE
Tom Thumb algorithm for planning simple vehicle motions
[PB95-107553] p 1484 N95-22156
COLLISION PARAMETERS
Measurement of W and Z production cross-sections in p(bar p) collisions at (radical)s = 1.8 TeV
[DE95-002250] p 1523 N95-21521
Correlations for the OH A(sup 2)(Sigma)(sup +)(v(prime)=0) electronic quenching cross-section
[DE95-002591] p 1244 N95-21524
COLLISIONAL PLASMAS
Collisional drift waves in the H-mode edge
[DE94-628950] p 1561 N95-21847
PIC simulation of surface waves
[AD-A285358] p 1563 N95-22422
COLLISIONLESS PLASMAS
Explicit analytical solution of the nonlinear Vlasov Poisson system
[DE94-628931] p 1500 N95-21592
Quasi-linear equation for magnetoplasma oscillations in the weakly relativistic approximation
[DE94-628932] p 1560 N95-21593
On the influence of electromagnetic wave and relativistic electron beam on a plasma
[DE94-628962] p 1561 N95-21848
COLLISIONS
A comparison of kinetic and multifluid simulations of laser-produced colliding plasmas
[DE94-016447] p 1551 N95-20315
Conservative smoothing versus artificial viscosity
[DE95-001108] p 1341 N95-20831
Ion-molecular spiraling collisions and termolecular recombination
[AD-A285633] p 1517 N95-21151
Angular and charge state distributions of highly charged ions scattered during low energy surface-channeling interactions with Au(110)
[DE95-001348] p 1525 N95-21857
Classical-quantum correspondence for ionization in fast ion-atom collisions
[DE95-000953] p 1526 N95-21940
Beam flavor dependence in the hadroproduction of D(+-) and D(sub s)(+-) mesons
[DE94-015541] p 1530 N95-22339
COLLOIDS
Technical Summary for 1993 fall MRS Symposium O, Complex Fluids
[AD-A283722] p 1264 N95-19972
Photoinduced charge transfer between fullerenes and TiO2 semiconductor colloids
[DE95-001447] p 1570 N95-20838
Novel materials and devices from self-assembled periodic structures
[AD-A286499] p 1232 N95-22211
COLOR
Orthogonal representations over finite fields and the chromatic number of graphs
[PB95-110953] p 1487 N95-19937
The synthesis and characterization of new mesogenic diacetylene monomers and their polymers
[AD-A286188] p 1267 N95-20328
Six-dimensional modeling of coherent bunch instabilities and related feedback systems in storage rings with power-series maps for the lattice
[DE94-017965] p 1532 N95-20494
Color control in a multichannel simulator display: The display for advanced research and training
[AD-A279717] p 1216 N95-20992
Search for new particles decaying to dijets in p(bar p) collisions at (radical)s = 1.8 TeV
[DE94-018994] p 1523 N95-21563
Hardware implementation of a desktop supercomputer for high performance image processing. Color image processing using cellular neural networks
[AD-A286455] p 1455 N95-21589
Azimuthally averaged radial S(sub 100 microns)/S(sub 60 microns) dust color temperatures in spiral galaxies
p 1593 N95-21760
European Workshop on Optical Ground Truth Instrumentation for the Validation of Space-Borne Optical Remote Sensing Data of the Marine Environment
[PB95-134144] p 1390 N95-21872
Test and Evaluation Plan (TEP) for Improvised Explosive Device Screening Systems (IEDSS)
[AD-A286382] p 1203 N95-22319
COLOR CODING
Hires and beyond p 1592 N95-21750
COLORIMETRY
Fiber-optic sensors for rapid, inexpensive characterization of soil and ground water contamination
[DE95-002471] p 1545 N95-21510
COMBAT
Bomber force 2000: Operational concepts for long-range combat aircraft
[AD-A279378] p 1206 N95-20181
Navigation system in combat vehicle
[PB95-131629] p 1452 N95-21467
Assessing post traumatic stress disorder and PTSD symptomatology in US Army personnel
[AD-A285941] p 1451 N95-22324
COMBINATORIAL ANALYSIS
Application of Markov decision processes to search problems
[PB95-110813] p 1497 N95-19914
Balanced matrices
[AD-A280021] p 1490 N95-20662
Approximation algorithms for the general and the asymmetric stacker-crane problems
[PB95-132098] p 1493 N95-21468
Rigorous spin-spin correlation function of Ising model on a special kind of Sierpinski Carpets
[DE94-628995] p 1575 N95-21854
COMBUSTIBLE FLOW
Two-dimensional imaging of OH in a lean burning high pressure combustor
[NASA-TM-106854] p 1214 N95-21383
COMBUSTION
The Combustive Sound Source
[ARL-TR-94-9] p 1503 N95-19911
Experimental investigation of PIC formation during the incineration of recovered CFC-11
[PB94-214772] p 1401 N95-20192
Radiative forcing calculations for CH3Cl
[DE94-019018] p 1402 N95-20355
Effect of chemical heat release in a temporally evolving mixing layer p 1249 N95-21037
Two-dimensional imaging of OH in a lean burning high pressure combustor
[NASA-TM-106854] p 1214 N95-21383
Analysis of cost: Combustion flame CVD diamond deposition
[AD-A279153] p 1278 N95-21973
Natural gas combustion chemistry mechanisms research
[PB95-111670] p 1247 N95-22150
COMBUSTION CHAMBERS
The 1993 JANNAF Propulsion Meeting, volume 2
[AD-A279569] p 1221 N95-20708
COMBUSTION CHEMISTRY
Computer program for calculation of complex chemical equilibrium compositions and applications. Part 1: Analysis
[NASA-RP-1311] p 1235 N95-20180
Combustion-related studies using weakly bonded complexes
[DE95-002801] p 1238 N95-20576
Annual Conference on Fire Research: Book of abstracts
[PB95-104964] p 1286 N95-20717
LIEKKI combustion technology
[DE95-700233] p 1242 N95-21282
Correlations for the OH A(sup 2)(Sigma)(sup +)(v(prime)=0) electronic quenching cross-section
[DE95-002591] p 1244 N95-21524
Numerical study of contaminant effects on combustion of hydrogen, ethane, and methane in air
[NASA-TM-106844] p 1284 N95-22114
Natural gas combustion chemistry mechanisms research
[PB95-111670] p 1247 N95-22150
COMBUSTION EFFICIENCY
EAGLES 1.1: A microcomputer software package for analyzing fuel efficiency of electric and gasoline vehicles
[DE95-001119] p 1469 N95-21829
COMBUSTION PHYSICS
Experimental investigation of PIC formation during the incineration of recovered CFC-11
[PB94-214772] p 1401 N95-20192
Molecular snapshots: Product imaging of dynamics important to fundamental combustion processes
[DE94-018595] p 1510 N95-20346
Proceedings of the Zel'Dovich Memorial International Conference on Combustion, Detonation, Shock Waves, volume 2
[AD-A286626] p 1239 N95-20769
LIEKKI combustion technology
[DE95-700233] p 1242 N95-21282
Studies in nonlinear problems of energy
[DE95-001387] p 1356 N95-22148
COMBUSTION PRODUCTS
Laboratory evaluation of a reactive baffle approach to NOx control
[AD-A283802] p 1400 N95-19921
Effects of non-unity Lewis numbers in diffusion flames
p 1249 N95-21036
Summaries of BFRL fire research in-house projects and grants, 1994
[PB95-130845] p 1286 N95-21130
COMETARY COLLISIONS
Experimental hypervelocity impact effects on simulated planetesimal materials
[DE94-017290] p 1599 N95-20144
Erice International Seminars on Planetary Emergencies. 17th Workshop: The Collision of an Asteroid or Comet with the Earth
[AD-A280122] p 1600 N95-21577
COMETS
Experimental hypervelocity impact effects on simulated planetesimal materials
[DE94-017290] p 1599 N95-20144
Erice International Seminars on Planetary Emergencies. 17th Workshop: The Collision of an Asteroid or Comet with the Earth
[AD-A280122] p 1600 N95-21577
Comets, impacts, and atmospheres
p 1422 N95-21810
COMFORT
Helicopter crewseat cushion program
[AD-A286654] p 1452 N95-20973
Quantitative evaluation of wrist posture and typing performance: A comparative study of 4 computer keyboards
[DE95-002392] p 1452 N95-21358
Ergonomic evaluation of the Apple Adjustable Keyboard
[DE95-002393] p 1453 N95-21637
COMMAND AND CONTROL
Advanced Command and Control (C2) applications interfaces to the Advanced Communications Technology Satellite (ACTS)
[AD-A279676] p 1291 N95-20605
Terrain and refractivity effects on non-optical paths
p 1294 N95-20931
Noncoherent transponder standards
[AD-A279512] p 1306 N95-21684
COMMAND LANGUAGES
DBASE 4 basics
[DE94-018323] p 1469 N95-21713
COMMERCE
Advanced Standard Electronic Modules format-E (SEM-E) processes for rapid prototyping
p 1210 N95-20642
User interface software tools
[AD-A286056] p 1466 N95-21325
HPCC technology awareness program: Improved economic competitiveness through technology awareness, transfer and application
[DE95-002134] p 1476 N95-21355

Proceedings of the 4th Annual Major Range and TestFacility Base (MRTFB) Environmental Workshop
[AD-A285779] p 1411 N95-22414

COMMERCIAL AIRCRAFT
Census US civil aircraft calendar year 1993
[AD-A286309] p 1199 N95-20091
Commuter/air taxi ditchings and water-related impacts that occurred from 1979 to 1989
[AD-A285691] p 1202 N95-20275
Why do airlines want and use thrust reversers? A compilation of airline industry responses to a survey regarding the use of thrust reversers on commercial transport airplanes
[NASA-TM-109158] p 1203 N95-20706

COMMONALITY
The opportunities for and challenges of common integrated electronics
[AD-A279991] p 1327 N95-20966

COMMUNICATION
Independent review of Aviation Technology and Research Information Analysis System (ATRIAS) database
[AD-A284049] p 1203 N95-21518

COMMUNICATION EQUIPMENT
System level fault tolerance in parallel and distributed computing systems
[AD-A279664] p 1474 N95-20305
DAMSON: A system to measure multipath dispersion, Doppler spread and Doppler shift on multi-mechanism communications channels p 1299 N95-20955

COMMUNICATION NETWORKS
A multivariate multisample rank test for stochastic simulation validation
[AD-A285922] p 1498 N95-19990
Facsimile transmission standards
[AD-A279911] p 1290 N95-20308
Resonant tunneling quantum well integrated optical waveguide modulator/switch
[AD-A285142] p 1542 N95-20501
Advanced Command and Control (C2) applications interfaces to the Advanced Communications Technology Satellite (ACTS)
[AD-A279676] p 1291 N95-20605
Optical backplane for modular avionics
p 1212 N95-20652
Test and Evaluation Master Plan (TEMP) for the Weather Message Switching Center Replacement (WMSCR)
[AD-A286590] p 1429 N95-20857
Highly survivable communications: Complementary media packet switched networks p 1292 N95-20922
Mitigation of effects of multiple path nulls at super-high frequencies through diversity and networking
p 1297 N95-20948
Polymer based all-optic reconfigurable interconnects
[AD-A279976] p 1272 N95-20962
Routing of unidirectional packet radio for wide-area paging network control and maintenance
[PB95-104428] p 1300 N95-20980
Utilizing artificial neural networks in network flow analysis: An annotated bibiliography
[DE95-002453] p 1482 N95-21522
High-capacity optical multichannel virtual mesh interconnection networks
[PB95-134094] p 1546 N95-21870
Directives for the participation in MiTS forum. V3.0
[PB95-110342] p 1484 N95-22015

COMMUNICATION SATELLITES
The design and analysis of a phased array microstrip antenna for a low earth orbit communication satellite
[AD-A284791] p 1289 N95-20065
Advanced Command and Control (C2) applications interfaces to the Advanced Communications Technology Satellite (ACTS)
[AD-A279676] p 1291 N95-20605
Space fundamentals for the war fighter
[AD-A279703] p 1217 N95-20690
QoS driven routing in packet switched networks of multiple transmission media p 1292 N95-20923

COMMUNICATION THEORY
General conservative extension theorem in process algebra
[PB95-110656] p 1487 N95-19902
Process algebra with partial choice
[PB95-110714] p 1487 N95-19907
Real time process algebra with infinitesimals
[PB95-110623] p 1488 N95-20055

COMMUTATORS
Growth series for the commutator subgroup
[PB95-111092] p 1490 N95-20452

COMMUTER AIRCRAFT
Commuter airplane accident data analysis
[AD-A286315] p 1202 N95-20174

COMPACTING
The development of a super-alpha2 titanium aluminide alloy consolidated by rapid omnidirectional compaction
[AD-A279254] p 1260 N95-21986

COMPATIBILITY
Circuit means for providing compatibility between two separate digital data interfaces
[AD-D016225] p 1455 N95-21116
Compatibility testing of explosives and paints by chemiluminescence techniques
[PB95-133609] p 1275 N95-21275
Materials compatibility and lubricants research on CFC-refrigerant substitutes
[DE94-018414] p 1287 N95-21631

COMPETITION
Competition between electromagnetic modes in a free-electron maser
[AD-A279546] p 1374 N95-21694

COMPILERS
Activities of the Research Institute for Advanced Computer Science
[NASA-CR-197291] p 1478 N95-22108
SCOPE 1.5: A Source-Code Optimization PackagEfor REDUCE 3.5: User's manual
[PB95-107579] p 1472 N95-22159

COMPLETENESS
Quality characteristics and metrics for reusable software
[PB94-203437] p 1473 N95-22390

COMPLEX COMPOUNDS
Combustion-related studies using weakly bonded complexes
[DE95-002801] p 1238 N95-20576
Selenophene transition metal complexes
[DE95-001675] p 1260 N95-21841
Preparation and x-ray structure of $Cp_2Ti(PH_2SiH_2)(PMe_3)$
[AD-A286197] p 1246 N95-21879

COMPLEX SYSTEMS
Proceedings of the 4th Systems Reengineering Technology Workshop
[AD-A285357] p 1460 N95-20546
Chemical Structure and Dynamics program
[DE95-001117] p 1403 N95-20834
Advanced computing systems: Usability of knowledge-based planning systems
[AD-A279573] p 1477 N95-21698
Intelligent interactive project management system
[PB95-132684] p 1586 N95-21982
Abstract interpretation of reactive systems: Abstractions preserving Universal CTL(*), Existential CTL(*) and CTL(*)
[PB95-110557] p 1472 N95-22305

COMPONENT RELIABILITY
Towards better quality and reliability in the software reuse library environment
[AD-A280013] p 1460 N95-20313
Highlights of recent balance of system research and evaluation
[DE95-001626] p 1393 N95-20863

COMPOSITE MATERIALS
Materials for adaptive structural acoustic control, volume 2
[AD-A279222] p 1502 N95-19883
Physics and applications of defects in advanced semiconductors, volume 325
[AD-A280059] p 1563 N95-19886
Materials/manufacturing element of the Advanced Turbine System Program
[DE94-017299] p 1378 N95-20085
Hierarchical structures in biology as a guide for new materials technology
[AD-A286317] p 1265 N95-20176
An application of wavelet transform for decomposition of millimeter-wave spectroscopic signals
[DE94-018366] p 1402 N95-20247
Multi-layered translated rib-stiffened composite hollow cylinder assembly
[AD-D016566] p 1226 N95-20292
Polyurethane-epoxy interpenetrating polymer network acoustic damping material
[AD-D016567] p 1266 N95-20293
Materials research for GHz multi-chip modules
[AD-A279661] p 1227 N95-20412
Dynamic measurement of the hoop modulus of a composite cylinder
[DE94-018958] p 1385 N95-20416
Composite cases for airborne electronic equipment: A technology study and EMC p 1212 N95-20655
Lightweight electronic enclosures using composite materials p 1213 N95-20656
Inorganic-organic polymers and their role in materials science
[AD-A279715] p 1270 N95-20671
Optical power limiting liquid crystal composites
[AD-A286605] p 1569 N95-20767
The processing and mechanical properties of high temperature/high performance composites. Processing/property correlations, book 4
[AD-A279739] p 1228 N95-20802
Detection of environmental deterioration in fiber reinforced composites by FT-Raman spectroscopy, phase 1
[AD-A279763] p 1228 N95-20805
The calculation and measurement of Helmholtz coil fields
[AD-A286081] p 1228 N95-20808
Fabrication of ceramic composites: Forced CVI
[DE95-001076] p 1271 N95-20821
Certain physical properties of lanthanum digermanide
[AD-A286592] p 1229 N95-20859
Test fixture for determination of energy absorbing capabilities of composite materials
[NASA-CASE-LAR-15212-1-CU] p 1229 N95-21008
Strain measurement by diffraction at LANSCE
[DE94-018264] p 1387 N95-21386
B4C-SiC reaction-sintered coatings on graphite plasma facing components
[DE94-019105] p 1230 N95-21553
The role of microcracking on the crack growth resistance of brittle solids and composites
[DE95-001678] p 1231 N95-21736
The role of grain boundary sliding on creep deformation characteristics of discontinuous reinforced composites
[DE95-001671] p 1231 N95-21924
Towards tailored interphase formation utilizing surface-bound benzylsulfonium salts as cationic initiators
[AD-A286461] p 1280 N95-22259
The thermal conductivity of silicon nitride with molybdenum disilicide additions
[DE94-017757] p 1247 N95-22260
Acoustic and vibration attenuation composite material
[AD-D016585] p 1233 N95-22467
Development and demonstration of advanced technologies for direct electrochemical oxidation of hydrocarbons (methanol, methane, propane)
[AD-A285094] p 1224 N95-22474

COMPOSITE PROPELLANTS
The hot fragment conductive ignition test for screening LOVA propellants
[AD-A284259] p 1282 N95-20187

COMPOSITE STRUCTURES
Attachment methodology for composite cylinder assembly
[AD-D016578] p 1227 N95-20459
Ferroic materials: Design, preparation and characteristics. Ceramic transactions, volume 43
[AD-A285937] p 1270 N95-20664
Wear resistant composite structure of vitreous carbon containing convoluted fibers
[DE95-002254] p 1228 N95-20787
Launch vehicle flight control augmentation using smart materials and advanced composites (CDDF Project 93-05)
[NASA-TP-3535] p 1218 N95-21346
Materials for adaptive structural acoustic controls
[AD-A279255] p 1505 N95-21863
Recent developments in low cost stable structures for space
[DE95-000857] p 1231 N95-22009
Attachment methodology for composite cylinder assembly
[AD-D016256] p 1381 N95-22034

COMPOSITION (PROPERTY)
Weld pool phenomena
[DE94-018965] p 1381 N95-21550
Solar helium and neon in the Earth
p 1419 N95-21793
Surface ices in the outer solar system
p 1423 N95-21815
Synthesis and characterization of single-source molecular precursors to binary metal sulphides: Bis(diethyldithiocarbamato) M(2)trialkylphosphine (M = Zn and Cd) adducts
[AD-A279746] p 1248 N95-22385

COMPRESSED GAS
Effect of propane-air on NGVs and vehicle fueling stations
[PB94-210085] p 1282 N95-20253
Experimental investigation of molecular beam injection in HL-1 tokamak
[DE94-631456] p 1556 N95-21165

COMPRESSIBILITY
Carbon fiber reinforced superconductor composites
[DE95-002504] p 1229 N95-20913
The processing and mechanical properties of high temperature/high performance composites. Book 6: Delamination and compressive behavior
[AD-A279780] p 1231 N95-21999

COMPRESSIBILITY EFFECTS
Numerical investigation of supersonic turbulent boundary layers with high wall temperature
p 1344 N95-21050
Effects of turbulence compressibility and unsteadiness in compression corner flow p 1344 N95-21052

COMPRESSIBLE BOUNDARY LAYER
Numerical simulation of supersonic boundary layer transition p 1348 N95-21074
COMPRESSIBLE FLOW
Evaluation of Reynolds stress turbulence closures in compressible homogeneous shear flow [NASA-CR-194892] p 1338 N95-20009
Continuum transient and frozen startup behavior of conventional and gas-loaded heat pipes [AD-A284297] p 1339 N95-20250
Effects of turbulence compressibility and unsteadiness in compression corner flow p 1344 N95-21052
Comparison of DNS and LES of transitional and turbulent compressible flow: Flat plate and mixing layer p 1347 N95-21066
Investigation of shear layer transition using various turbulence models p 1352 N95-21096
Convergence acceleration of the Proteus computer code with multigrid methods [NASA-CR-197677] p 1467 N95-21450
Computations of unsteady viscous compressible flows using adaptive mesh refinement in curvilinear body-fitted grid systems [NASA-TM-106704] p 1356 N95-21959
COMPRESSING
Digital filtering for data compression in telemetry systems [DE94-016611] p 1219 N95-20567
COMPRESSION LOADS
Damage tolerance of carbon fibre polyetheretherketone laminates [PB95-131611] p 1230 N95-21432
COMPRESSION TESTS
Damage tolerance of carbon fibre polyetheretherketone laminates [PB95-131611] p 1230 N95-21432
Characterization of a texture gradient in tantalum plate [DE95-002704] p 1262 N95-22289
COMPRESSIVE STRENGTH
Structural performance of cylindrical pressure housings of different ceramic compositions under external pressure loading. Part 3: Sintered reaction bonded silicon nitride ceramic [AD-A285773] p 1388 N95-22411
COMPRESSORS
Malone-brayton cycle engine/heat pump [AD-D016573] p 1378 N95-20295
COMPTON EFFECT
Exclusive processes: Tests of coherent QCD phenomena and nucleon substructure at CEBAF [DE95-002892] p 1520 N95-21336
Recent photoabsorption measurements in the rare gases and alkalis in the 3 to 15 keV photon energy region [DE94-019278] p 1521 N95-21406
Neutron Compton scattering [PB95-130290] p 1530 N95-22332
COMPUTATION
Computation of invariant manifolds [PB95-135687] p 1492 N95-21318
HPCC technology awareness program: Improved economic competitiveness through technology awareness, transfer and application [DE95-002134] p 1476 N95-21355
Preconditioning via asymptotically-defined domain decomposition [DE94-019046] p 1493 N95-21564
Connectionist models for intelligent computation [AD-A286436] p 1484 N95-22210
Fast parallel tree codes for gravitational and fluid dynamical N-body problems [AD-A286480] p 1358 N95-22290
Time and the order of abstract events in distributed computations [PB95-110482] p 1496 N95-22349
COMPUTATIONAL ASTROPHYSICS
Relativistic binary neutron star coalescence [DE94-019311] p 1600 N95-21479
COMPUTATIONAL CHEMISTRY
Computer program for calculation of complex chemical equilibrium compositions and applications. Part 1: Analysis [NASA-RP-1311] p 1235 N95-20180
T1F ((1) sigma (+)): Some preliminary electronic structure calculations [PB95-130316] p 1518 N95-21223
Comparative computational analysis of some nitramine and difluoramine structures, dissociation energies and heats of formation [AD-A286196] p 1525 N95-21878
Non-local density functional calculations of gas phase heats of formation [AD-A286213] p 1246 N95-22000
COMPUTATIONAL FLUID DYNAMICS
Multigrid with matrix-dependent transfer operators for convection-diffusion problems [PB95-110821] p 1487 N95-19915
Open Skies project computational fluid dynamic analysis [AD-A285928] p 1200 N95-19991
Stabilization and control problems in structural dynamics [AD-A279996] p 1340 N95-20312
Mapping closures for turbulent combustion [AD-A279995] p 1238 N95-20597
HIVEL2D: A two-dimensional flow model for high-velocity channels [AD-A286556] p 1341 N95-20843
Laser anemometry and viscous computation of the flow through an annular turbine cascade [AD-A280070] p 1341 N95-20968
Mixed hp finite element methods for problems in elasticity and stokes flow [PB95-104444] p 1341 N95-20981
Simulation of the injection moulding process [PB94-215555] p 1286 N95-21027
Studying Turbulence Using Numerical Simulation Databases. 5: Proceedings of the 1994 Summer Program [NASA-CR-197362] p 1341 N95-21035
Direct numerical simulations of turbulent non-premixed methane-air flames modeled with reduced kinetics p 1249 N95-21038
Turbulent transport in premixed flames p 1249 N95-21040
The coupling between flame surface dynamics and species mass conservation in premixed turbulent combustion p 1249 N95-21041
Pdf modeling for premixed turbulent combustion based on the properties of iso-concentration surfaces p 1249 N95-21042
Passive turbulent flamelet propagation p 1249 N95-21043
Simulation of a turbulent flame in a channel p 1249 N95-21044
Pressure and higher-order spectra for homogeneous isotropic turbulence p 1343 N95-21045
Statistics of pressure and pressure gradient in homogeneous isotropic turbulence p 1343 N95-21046
Vortex ring instability and its sound p 1344 N95-21048
Numerical investigation of supersonic turbulent boundary layers with high wall temperature p 1344 N95-21050
A Lagrangian dynamic subgrid-scale model turbulence p 1344 N95-21051
Role of pressure diffusion in non-homogeneous shear flows p 1345 N95-21053
Modeling the two-point correlation of the vector stream function p 1345 N95-21055
On the transition towards slow manifold in shallow-water and 3D Euler equations in a rotating frame p 1345 N95-21057
Anisotropic structure of homogeneous turbulence subjected to uniform rotation p 1346 N95-21059
Single point modeling of rotating turbulent flows p 1346 N95-21060
Application of Direct and Large Eddy Simulation to Transition and Turbulence [AGARD-CP-551] p 1346 N95-21061
Developments and applications of dynamic models for large eddy simulation of complex flows p 1346 N95-21062
Large-eddy simulation of rotating channel flows using a localized dynamic model p 1346 N95-21064
The asymptotic state of rotating homogeneous turbulence at high Reynolds numbers p 1347 N95-21065
Direct numerical simulation of turbulent flow in a sudden pipe expansion p 1347 N95-21067
Simulation of separated flows p 1347 N95-21068
Simulation of large scale transitional flows p 1348 N95-21075
Modelling anisotropy and backscatter effects in the subgrid scale stress tensor p 1349 N95-21077
Simulation of pipe flow p 1349 N95-21078
Simulations of bypass transition for spatially evolving disturbances p 1349 N95-21079
Direct numerical determination of the minimum bypass Reynolds number in boundary layers p 1349 N95-21080
Direct numerical simulation for premixed turbulent combustion modelling p 1249 N95-21082
Entrainment in a shear-free turbulent mixing layer p 1350 N95-21083
Numerical study of realistic perturbations in three-dimensional boundary layers p 1351 N95-21091
On subcritical instability of the attachment line boundary layer p 1351 N95-21092
Spatial direct numerical simulation of boundary layer transition under strong adverse pressure gradient p 1351 N95-21093
Navier-Stokes simulations of the effects of suction holes on a flat plate boundary layer p 1352 N95-21094
Investigation of shear layer transition using various turbulence models p 1352 N95-21096
Computational studies of laminar to turbulence transition [AD-A285622] p 1353 N95-21146
Nonlinear acoustic processes in a solid rocket engine [AD-A285606] p 1222 N95-21193
The structure of turbulence and other motions beneath an air-water interface [AD-A279838] p 1434 N95-21293
Application of Navier-Stokes code PAB3D with kappa-epsilon turbulence model to attached and separated flows [NASA-TP-3480] p 1201 N95-21338
Convergence acceleration of the Proteus computer code with multigrid methods [NASA-CR-197677] p 1467 N95-21450
One-dimensional reactive Euler equations [PB95-135430] p 1244 N95-21573
Grid resolution and solution convergence for Mars Pathfinder forebody [NASA-TM-109173] p 1494 N95-21622
DIFFPACK: Software for partial differential equations [PB95-110268] p 1468 N95-21654
Numerical investigations of low-density nozzle flow by solving the Boltzmann equation [NASA-TM-110492] p 1354 N95-21675
Status of CFDLIB performance tests on the T3D [DE95-002708] p 1478 N95-21925
Massively-parallel computational fluid dynamics [AD-A279389] p 1355 N95-21942
Hybrid Upwind Splitting (HUS) by a field-by-field decomposition [NASA-TM-106843] p 1355 N95-21957
Computations of unsteady viscous compressible flows using adaptive mesh refinement in curvilinear body-fitted grid systems [NASA-TM-106704] p 1356 N95-21959
Vortex atoms and vortons [PB95-134599] p 1356 N95-21963
State of the art in CFD pre- and postprocessing [PB95-110391] p 1356 N95-22017
DOD science and engineering apprenticeship program for high school students [AD-A280371] p 1583 N95-22100
Effects of yaw and pitch motion on model attitude measurements [NASA-TM-4641] p 1368 N95-22109
Fluid dynamics of the freeboard in a fluidized bed reactor [PB95-134029] p 1357 N95-22160
On the dynamics of a shock-bubble interaction [NASA-CR-194978] p 1495 N95-22325
Sandia National Laboratories analysis code data base [DE95-004188] p 1502 N95-22420
Turbulence modeling for separated flow p 1359 N95-22443
Notes on rotating turbulence p 1359 N95-22444
Local dynamic subgrid-scale models in channel flow p 1360 N95-22447
Unstructured-grid large-eddy simulation of flow over an airfoil p 1202 N95-22448
Large-eddy simulation of flow through a plane, asymmetric diffuser p 1360 N95-22449
Large-eddy simulation of a boundary layer with concave streamwise curvature p 1360 N95-22450
Direct numerical simulations of on-demand vortex generators: Mathematical formulation p 1361 N95-22452
Drag reduction strategies p 1361 N95-22453
Optimal active control for Burgers equations p 1361 N95-22454
Numerical study of boundary layer interaction with shocks: Method and code validation p 1362 N95-22461
Resolution requirements for velocity gradients in turbulence p 1363 N95-22462
Direct numerical simulation of incompressible axisymmetric flows p 1363 N95-22464
COMPUTATIONAL GEOMETRY
Stars or stripes: A comparative study of finite and transfinite techniques for surface modelling [PB95-134979] p 1464 N95-20975
COMPUTATIONAL GRIDS
Multigrid with matrix-dependent transfer operators for convection-diffusion problems [PB95-110821] p 1487 N95-19915
A control volume method on an icosahedral grid for numerical integration of the shallow-water equations on the sphere [DE94-016345] p 1489 N95-20170

Meshes: The next generation
[DE94-016702] p 1459 N95-20255

RALPAR-RAL mesh partitioning program version 1.1
[PB95-129847] p 1475 N95-20435

Eta%-Superconvergence of Finite Element Approximations in the Interior of General Meshes of Triangles
[AD-A279903] p 1490 N95-20565

Study of superconvergence by a computer-based approach: Superconvergence of the gradient of the displacement, the strain and stress in finite element solutions for plane elasticity
[AD-A279885] p 1490 N95-20588

ALCHEMI of Fe-doped B2-ordered NiAl alloys with different doping levels
[DE94-017748] p 1255 N95-20907

Mixed hp finite element methods for problems in elasticity and stokes flow
[PB95-104444] p 1341 N95-20981

Simulation of the injection moulding process
[PB94-215555] p 1286 N95-21027

VLUGr3: A vectorizable adaptive grid solver for PDEs in 3D. 2: Code description
[PB95-135737] p 1465 N95-21033

Comparison of DNS and LES of transitional and turbulent compressible flow: Flat plate and mixing layer
p 1347 N95-21066

Modelling anisotropy and backscatter effects in the subgrid scale stress tensor p 1349 N95-21077

Simulations of bypass transition for spatially evolving disturbances p 1349 N95-21079

Direct numerical determination of the minimum bypass Reynolds number in boundary layers
p 1349 N95-21080

Support to the development of high-level graphics software
[PB95-131686] p 1466 N95-21349

VLUGR3: A vectorizable adaptive grid solver for PDEs in 3D. 1: Algorithmic aspects and applications
[PB95-135729] p 1467 N95-21435

Convergence acceleration of the Proteus computer code with multigrid methods
[NASA-CR-197677] p 1467 N95-21450

Finite element modelling of creep crack growth in 316 stainless and 9Cr-1Mo steels
[DE94-018977] p 1258 N95-21560

Analysis of a local defect correction approach on composite grids
[PB95-135455] p 1493 N95-21574

Grid resolution and solution convergence for Mars Pathfinder forebody
[NASA-TM-109173] p 1494 N95-21622

Flow and heat transfer simulation in a flash smelting furnace
[PB95-108197] p 1354 N95-21649

Computations of unsteady viscous compressible flows using adaptive mesh refinement in curvilinear body-fitted grid systems
[NASA-TM-106704] p 1356 N95-21959

Absorbing boundary condition for floating two-dimensional objects in current and waves
[PB95-132882] p 1356 N95-22063

Occupant reach and mobility apparatus
[AD-D016253] p 1454 N95-22099

On the wavelet optimized finite difference method
[NASA-CR-191601] p 1495 N95-22157

On the dynamics of a shock-bubble interaction
[NASA-CR-194978] p 1495 N95-22325

Transformation of multichannel magnetocardiographic signals to standard grid form
[PB95-127114] p 1447 N95-22371

A dynamic localization model with stochastic backscatter p 1359 N95-22445

Local dynamic subgrid-scale models in channel flow
p 1360 N95-22447

Unstructured-grid large-eddy simulation of flow over an airfoil p 1202 N95-22448

Large-eddy simulation of a boundary layer with concave streamwise curvature p 1360 N95-22450

COMPUTER AIDED DESIGN

A new tool for accelerator system modeling and analysis
[DE94-018292] p 1531 N95-20203

Numerical controlled polishing program, continued forced wear and part correction experiments
[DE94-018084] p 1285 N95-20288

Computer-Aided Structural Engineering (CASE) project. User's guide: Computer-Aided Structural Modeling (CASM). Version 5.00
[AD-A279913] p 1459 N95-20310

Parallel calculation of sensitivity derivatives for aircraft design using automatic differentiation
[NASA-TM-110103] p 1206 N95-20370

Applications of wavelets to radar, imaging and related problems
[AD-A279909] p 1290 N95-20545

The 29th MIL-HDBK-17 Polymer Matrix Composites Coordination Group Meeting
[AD-A279917] p 1269 N95-20578

Automation support for concurrent software engineering
[AD-A279691] p 1461 N95-20579

Design and implementation of visual object-oriented LOGO using Prograph
[AD-A285977] p 1461 N95-20687

Use of an integrated design tool for weld quality enhancement
[DE94-018135] p 1379 N95-20723

Stars or stripes: A comparative study of finite and transfinite techniques for surface modelling
[PB95-134979] p 1464 N95-20975

Routing of unidirectional packet radio for wide-area paging network control and maintenance
[PB95-104428] p 1300 N95-20980

An automatic placement tool for rapid prototyping of printed circuit boards
[AD-A286029] p 1328 N95-20997

Next generation solid modellers for electronic prototyping
[AD-A286525] p 1464 N95-21010

Proceedings of the NATO-Advanced Study Institute on Computer Aided Analysis of Rigid and Flexible Mechanical Systems. Volume 1: Main lectures
[AD-A286062] p 1380 N95-21171

SEEK: A FORTRAN optimization program using a feasible directions gradient search
[NASA-CR-4641] p 1380 N95-21359

Representing manufacturing features to support design and process changes
[DE94-018587] p 1467 N95-21389

Development of quiet-flow supersonic wind tunnels for laminar-turbulent transition research
[NASA-CR-197286] p 1216 N95-21436

Proceedings of the NATO-Advanced Study Institute on Computer Aided Analysis of Rigid and Flexible Mechanical Systems. Volume 2: Contributed papers
[AD-A286063] p 1381 N95-21488

An MCM concurrent engineering software tool market study
[AD-A279257] p 1468 N95-21489

Crew-Centered Cockpit Design (CCCD) field demonstration program, volume 1
[AD-A286426] p 1453 N95-21566

Directed light fabrication
[DE94-018293] p 1375 N95-21837

Using the CoRE requirements method with ADARTS. Version 01.00.05
[AD-A279151] p 1470 N95-21972

Generic architecture for knowledge-based control of processes in dynamic environments
[PB95-132676] p 1483 N95-21981

Discovering related DNA sequences via mutual information
[DE95-001101] p 1440 N95-22067

Structuring design requirements using YMIR
[PB95-132742] p 1471 N95-22081

Normal form analysis of the Tevatron
[DE94-017172] p 1539 N95-22192

Application of computer-generated holograms to optical transformations
[AD-A286356] p 1368 N95-22256

ActorStudio reference manual. A user's guide to the ActorStudio user interface editor, version 1.0
[PB95-127023] p 1472 N95-22310

Overview of rapid prototyping technologies in manufacturing
[PB95-127122] p 1472 N95-22372

A conceptual approach to object-oriented data modeling
[AD-A286048] p 1592 N95-22416

Fuzzy clustering of facial form for prototyping environmental protection equipment
[DE94-014657] p 1454 N95-22466

Wind Energy Program overview, fiscal year 1993
[DE94-000285] p 1398 N95-22468

COMPUTER AIDED MANUFACTURING

Adaptive path planning for flexible manufacturing
[DE94-016561] p 1459 N95-20284

Applications of wavelets to radar, imaging and related problems
[AD-A279909] p 1290 N95-20545

An automatic placement tool for rapid prototyping of printed circuit boards
[AD-A286029] p 1328 N95-20997

Next generation solid modellers for electronic prototyping
[AD-A286525] p 1464 N95-21010

Virtual reality in precision engineering research
[AD-A286528] p 1465 N95-21012

Representing manufacturing features to support design and process changes
[DE94-018587] p 1467 N95-21389

Directed light fabrication
[DE94-018293] p 1375 N95-21837

Overview of rapid prototyping technologies in manufacturing
[PB95-127122] p 1472 N95-22372

Wind Energy Program overview, fiscal year 1993
[DE94-000285] p 1398 N95-22468

COMPUTER AIDED MAPPING

Selective polygon map display method
[AD-D016518] p 1590 N95-21463

Digital mapping, charting, and geodesy analysis program technical review of Vector Smart Map (VMap) level 1
[AD-A286294] p 1390 N95-22055

Life Sciences Division and Center for Human Genome Studies
[DE94-017796] p 1440 N95-22065

COMPUTER AIDED TOMOGRAPHY

Seminar on Biomedical Engineering 1993
[PB95-104402] p 1443 N95-20971

COMPUTER ASSISTED INSTRUCTION

Intelligent tutoring systems: Past, present, and future
[AD-A280011] p 1448 N95-19970

Determining the usability of Digital Video Interactive (DVI) technology in computer-based instruction
[AD-A284717] p 1457 N95-20060

Computer-Aided Structural Engineering (CASE) project. User's guide: Computer-Aided Structural Modeling (CASM). Version 5.00
[AD-A279913] p 1459 N95-20310

Generating examples for use in tutorial explanations: The use of a subsumption based classifier
[AD-A286028] p 1464 N95-20996

Proposal for a tutorial on Minimal Length Encoding (MLE) in molecular biology
[DE94-015076] p 1438 N95-21376

A computer-based multimedia prototype for night vision goggles
[AD-A286208] p 1546 N95-21882

Development and evaluation of ALEC Micro-Wand 3e (tradename) training
[AD-A285863] p 1471 N95-22133

COMPUTER COMPONENTS

Ergonomic evaluation of the Apple Adjustable Keyboard
[DE95-002393] p 1453 N95-21637

An evaluation of the Gear Averaging Signal Processor (GASP)
[DSTO-TR-0067] p 1470 N95-21950

COMPUTER CONFERENCING

Application-oriented architecture for multimedia teleservices
[PB95-135513] p 1306 N95-21623

COMPUTER GRAPHICS

PRSPLOT6 manual
[PB95-110862] p 1456 N95-19928

Design considerations for parallel graphics libraries
[NASA-CR-194935] p 1473 N95-20013

Unified GUI for the Los Alamos Radiation Transport Code System
[DE94-016088] p 1458 N95-20154

A practical guide to using MCNP with PVM
[DE94-016162] p 1474 N95-20158

Data analysis and visualization in MCNP (trademark)
[DE94-016164] p 1508 N95-20159

An object-oriented optimization systems
[DE94-016190] p 1459 N95-20165

Computer-Aided Structural Engineering (CASE) project. User's guide: Computer-Aided Structural Modeling (CASM). Version 5.00
[AD-A279913] p 1459 N95-20310

Making structured graphics and constraints practical for large-scale applications
[AD-A280062] p 1461 N95-20623

Computer graphics tools for visualizing gravity gradient torques on a rigid spacecraft
[AD-A285971] p 1461 N95-20665

Design and implementation of visual object-oriented LOGO using Prograph
[AD-A285977] p 1461 N95-20687

Use of an integrated design tool for weld quality enhancement
[DE94-018135] p 1379 N95-20723

ALCHEMI of Fe-doped B2-ordered NiAl alloys with different doping levels
[DE94-017748] p 1255 N95-20907

Direct simulation and graphics post-processing of three-dimensional turbulent flows p 1352 N95-21098

DAVE: A plug and play model for distributed multimedia application development
[DE94-016481] p 1465 N95-21153

Support to the development of high-level graphics software
[PB95-131686] p 1466 N95-21349

Selective polygon map display method
[AD-D016518] p 1590 N95-21463

Top ten list of user-hostile interface design
[DE95-001602] p 1453 N95-21721
Tethered satellite: Forces and motion
[NASA-TM-110518] p 1220 N95-21858
MARI mini-manual
[PB95-134649] p 1526 N95-21965
Residual stress analysis in swage autofrettaged thick-walled cylinders by position-sensitive x-ray diffraction techniques
[AD-A286383] p 1388 N95-22320

COMPUTER INFORMATION SECURITY

An abstract model of rogue code insertion into radio frequency wireless networks. The effects of computer viruses on the Program Management Office
[AD-A285759] p 1288 N95-19932
Semaphore network encryption report
[AD-A279294] p 1303 N95-21493
Proceedings of the 5th Workshop on the Next Generation of CASE Tools
[PB95-135208] p 1469 N95-21716

COMPUTER NETWORKS

Testing paradigm applied to network structure (revised)
[PB95-110706] p 1487 N95-19906
A multivariate multisample rank test for stochastic simulation validation
[AD-A285922] p 1498 N95-19990
Migrating the Facility Profile Information Management System into the World Wide Web
[DE94-018367] p 1586 N95-20016
A group communication approach for mobile computing mobile channel: An ISIS tool for mobile services

ECSU-AASERT summer research project in parallel processing and computer visualization
[AD-A285983] p 1475 N95-20618
The IEEE scalable coherent interface: An approach for a unified avionics network p 1212 N95-20650
High performance backplane components for modular avionics p 1212 N95-20653
Environment for Test and Analysis of Distributed Software (ETADS)
[AD-A285776] p 1463 N95-20877
DAVE: A plug and play model for distributed multimedia application development
[DE94-016481] p 1465 N95-21153
An object-oriented implementation of the Xpress transfor protocol
[DE95-001506] p 1301 N95-21277
Semaphore network encryption report
[AD-A279294] p 1303 N95-21493
Network file server with automatic sensing means
[AD-D016250] p 1476 N95-21496
PVM 3 beyond network computing
[DE94-019115] p 1477 N95-21556
PVM a platform for portable distributed computing
[DE94-019156] p 1455 N95-21607
Massively-parallel computational fluid dynamics
[AD-A279389] p 1355 N95-21942
Activities of the Research Institute for Advanced Computer Science
[NASA-CR-197291] p 1478 N95-22108
Network distributed global memory for transparent message passing on distributed networks
[AD-A286096] p 1478 N95-22228
Using geographical data browsers in a networked environment
[DE94-017809] p 1592 N95-22263

COMPUTER PROGRAM INTEGRITY

New method for integrity constraint checking in deductive databases
[PB95-110672] p 1586 N95-19904

COMPUTER PROGRAMMING

Hierarchical diagrammatic representation of class structure
[PB95-110722] p 1456 N95-19908
Real time process algebra with infinitesimals
[PB95-110623] p 1488 N95-20055
Comparison of Ward and Mellor's transformation schema with State- and Activitycharts
[PB95-110698] p 1459 N95-20258
Software merge: Semantics of combining changes to programs
[AD-A279657] p 1459 N95-20304
Towards better quality and reliability in the software reuse library environment
[AD-A280013] p 1460 N95-20313
A theoretical study on the performance of the FDTD code on a massively parallel computer
[AD-A285346] p 1475 N95-20499
Proceedings of the 4th Systems Reengineering Technology Workshop
[AD-A285357] p 1460 N95-20546
Measuring software dependability by robustness benchmarking
[AD-A280053] p 1461 N95-20622
Computer graphics tools for visualizing gravity gradient torques on a rigid spacecraft
[AD-A285971] p 1461 N95-20665
Model formality in human/computer collaboration
[AD-A286001] p 1462 N95-20718
Software Capability Evaluation (SCE), version 2.0 team members guide
[AD-A286082] p 1462 N95-20809
Rate monotonic analysis for real-time systems: Instructors guide
[AD-A286083] p 1463 N95-20810
Functional and para-functional parallel processing
[DE95-002805] p 1475 N95-20888
Real-time reconfiguration study
[AD-A286060] p 1464 N95-20910
Monadic maps and folds for arbitrary datatypes
[PB95-134045] p 1492 N95-21032
PRSCAL manual
[PB95-130480] p 1465 N95-21231
Expressions that talk about themselves
[PB95-134060] p 1466 N95-21344
GRONICs-1994. Proceedings of the 1994 Groningen Student Conference on Computer Science
[PB95-135620] p 1468 N95-21455
Top-down non-correcting error recovery in LLgen
[PB95-132718] p 1471 N95-22031
Foundations of functional programming: A programmer's point of view
[PB95-132932] p 1471 N95-22094
SCOPE 1.5: A Source-Code Optimization PackagEfor REDUCE 3.5: User's manual
[PB95-107579] p 1472 N95-22159
Incremental rederivation of software artifacts: FY 1993
[AD-A285790] p 1473 N95-22402

COMPUTER PROGRAMS

High performance hardware and software for pattern recognition and image processing
[AD-A279776] p 1457 N95-19961
Ice Processing System software support documentation
[AD-A280030] p 1388 N95-20006
Charged particle dynamics in the acceleration gap of the PBFA 2 ion diode
[DE94-017347] p 1506 N95-20026
Software fault tree analysis of concurrent Ada processes
[AD-A284979] p 1457 N95-20042
Advanced detector development, laboratory simulations, diagnostic development, and data analysis on wake physics
[AD-A284798] p 1364 N95-20069
SYNTH: A spectrum synthesizer
[DE94-015943] p 1458 N95-20153
Nonlinear dynamic fluid-structure interaction calculations with coupled finite element and finite volume programs
[DE94-016204] p 1339 N95-20166
Theoretical prediction of vibrational circular dichroism spectra of R-glyceraldehyde, R-erythrose, and R-threose. Part 2: Development of a procedure to scale the force constant matrix expressed in terms of internal coordinates
[AD-A284305] p 1437 N95-20252
Studies of longitudinal instability with an electron beam
[DE94-018646] p 1532 N95-20347
Choice of computer software for analysis of spectra from the Multi-Spectral Logging System
[DE94-019013] p 1460 N95-20351
First principles simulation of materials properties
[DE94-016781] p 1566 N95-20405
Program WALKMAN: A code designed to perform electron single collision elastic scattering Monte Carlo calculations
[DE94-017501] p 1511 N95-20444
Proceedings of the 4th Systems Reengineering Technology Workshop
[AD-A285357] p 1460 N95-20546
TBell: A mathematical tool for analyzing decision tables
[NASA-CR-195027] p 1462 N95-20691
The design of a parallel, dense linear algebra software library: Reduction to Hessenberg, tridiagonal, and bidiagonal form
[DE94-018123] p 1491 N95-20701
A new process for acquiring software architecture
[AD-A286012] p 1462 N95-20721
Modeling the effect of shroud contact and friction dampers on the mistuned response of turbopumps
[NASA-CR-197285] p 1379 N95-20795
Geometric moire method of strain analysis with displacement discontinuities
[DE95-001114] p 1386 N95-20833
Prediction of rotor-blade deformations due to unsteady airloads
[AD-A286593] p 1207 N95-20860
COYOTE II: A finite element computer program for nonlinear heat conduction problems. Part 1: Theoretical background
[DE95-002587] p 1463 N95-20887
Enhancements in the Livermore spectrum analysis package PIXEF
[DE95-002487] p 1272 N95-20895
ALCHEMI of Fe-doped B2-ordered NiAl alloys with different doping levels
[DE94-017748] p 1255 N95-20907
The opportunities for and challenges of common integrated electronics
[AD-A279991] p 1327 N95-20966
Simulation of the injection moulding process
[PB94-215555] p 1286 N95-21027
Simulation of separated flows p 1347 N95-21066
The iMAPS: General information
[AD-A285421] p 1465 N95-21176
PRSCAL manual
[PB95-130480] p 1465 N95-21231
PRISMA operating program manual
[PB95-130498] p 1466 N95-21232
Multiple hard interactions in HERWIG
[PB95-130548] p 1518 N95-21233
Time-dependent deformation of titanium metal matrix composites
[NASA-CR-195030] p 1230 N95-21363
Data link terminal DLT document
[PB95-110805] p 1205 N95-21369
Generalised approach to software structure metrics
[PB95-107561] p 1467 N95-21411
EXPERT system expert: Program description
[PB95-131561] p 1482 N95-21429
SSME HPOTP post-test diagnostic system enhancement project
[NASA-CR-4643] p 1222 N95-21458
Selective polygon map display method
[AD-D016518] p 1590 N95-21463
Monomer mapping: A PC-based software tool facilitating the determination of monomer compositions from mass spectrometric molecular weight data
[PB95-132155] p 1275 N95-21470
Computer programs for analysis of geophysical data
[DE95-002472] p 1415 N95-21511
BASIC program for power spectrum estimation
[DE95-002228] p 1468 N95-21515
Power systems for future missions. Appendices A-L
[NASA-CR-195320-APP-A-L] p 1395 N95-21530
Analysis of a disk-on-rod surface wave element inside a corrugated horn using the mode-matching technique
p 1305 N95-21543
Unified very low stratus cloud/subcloud microphysics model: User's guide
[AD-A286454] p 1430 N95-21586
Report of the Numerical Analysis Group
[PB95-108163] p 1494 N95-21648
A method to determine the kinematics of the lower limbs of a subject pedaling a bicycle using encoders and accelerometers
[NASA-CR-197401] p 1453 N95-21866
Generic architecture for knowledge-based control of processes in dynamic environments
[PB95-132676] p 1483 N95-21981
Numerical investigation of one-dimensional heat-flux calculations
[AD-A286293] p 1582 N95-22054
NODDS/WOSM interface user's manual
[AD-A279095] p 1471 N95-22068
A Davis-Putnam program and its application to finite-order model search: Quasigroup existence problems
[DE95-003014] p 1471 N95-22077
Regional scale hydrology with a new land surface processes model
[NASA-TM-110500] p 1390 N95-22111
Development and evaluation of ALEC Micro-Wand 3e (tradename) training
[AD-A285863] p 1471 N95-22133
Evaluation of scanners for C-scan imaging for nondestructive inspection of aircraft
[AD-A286398] p 1383 N95-22202
Adaptive fault-resistant systems
[AD-A286406] p 1484 N95-22203
Network distributed global memory for transparent message passing on distributed networks
[AD-A286096] p 1478 N95-22228

Confirmatory analysis of SAGE-1, and -2 data
[DE95-003623] p 1427 N95-22240
High performance computing for beam physics applications
[DE94-018312] p 1539 N95-22243
An assessment of European parallel software research
[AD-A286357] p 1479 N95-22257
3-D TECATE/BREW: Thermal, stress, and birefringent ray-tracing codes for solid-state laser design
[DE95-000330] p 1376 N95-22301
Logic programming and negation: A survey
[PB95-110730] p 1472 N95-22302
A new parallel method for molecular dynamics simulation of macromolecular systems
[DE94-018621] p 1529 N95-22315
Quality characteristics and metrics for reusable software
[PB94-203437] p 1473 N95-22390
Incremental rederivation of software artifacts: FY 1993
[AD-A285790] p 1473 N95-22402
Numerical study of boundary layer interaction with shocks: Method and code validation
p 1362 N95-22461
Databases post-processing in Tensoral
p 1363 N95-22465
Wind Energy Program overview, fiscal year 1993
[DE94-000285] p 1398 N95-22468

COMPUTER STORAGE DEVICES
An IBM based ARINC interface
[ARL-TR-21] p 1471 N95-22104

COMPUTER SYSTEMS DESIGN
High-performance packet switching architecture for ATM: Conventional solution and neural network solution
[PB95-110920] p 1312 N95-19935
The design and implementation of the functional/daplex data interface for the multimodel and multilingual database system
[AD-A280131] p 1587 N95-20039
System level fault tolerance in parallel and distributed computing systems
[AD-A279664] p 1474 N95-20305
A group communication approach for mobile computing mobile channel: An ISIS tool for mobile services
[AD-A279785] p 1290 N95-20306
Measuring software dependability by robustness benchmarking
[AD-A280053] p 1461 N95-20622
The Advanced Avionics Subsystem Technology Demonstration Program p 1209 N95-20636
The IEEE scalable coherent interface: An approach for a unified avionics network p 1212 N95-20650
Environment for Test and Analysis of Distributed Software (ETADS)
[AD-A285776] p 1463 N95-20877
Visual displays and Neuro-Linguistic Programming
[DE95-001454] p 1466 N95-21311
EXPERT system expert: Program description
[PB95-131561] p 1482 N95-21429
Semaphore network encryption report
[AD-A279294] p 1303 N95-21493
Network file server with automatic sensing means
[AD-D016250] p 1476 N95-21496
SCSI controller with target status retrieval
[AD-D016249] p 1476 N95-21504
Independent review of Aviation Technology and Research Information Analysis System (ATRIAS) database
[AD-A284049] p 1203 N95-21518
Design model for open distributed processing systems
[PB95-135505] p 1477 N95-21620
Application-oriented architecture for multimedia teleservices
[PB95-135513] p 1306 N95-21623
Method of retrieving and storing computer peripheral data
[AD-D016251] p 1591 N95-22098
An IBM based ARINC interface
[ARL-TR-21] p 1471 N95-22104
The navigation toolkit
[NASA-CR-197290] p 1205 N95-22161
Formal specification and compositional verification of an atomic broadcast protocol
[PB95-110508] p 1472 N95-22351
TDX: A high-bandwidth crossbar-switched communication paradigm
[DE94-017187] p 1311 N95-22407

COMPUTER SYSTEMS PERFORMANCE
High-performance packet switching architecture for ATM: Conventional solution and neural network solution
[PB95-110920] p 1312 N95-19935
Target area acquisition and control system survivability for the National Ignition Facility
[DE94-016549] p 1550 N95-20190
A theoretical study on the performance of the FDTD code on a massively parallel computer
[AD-A285346] p 1475 N95-20499
Semaphore network encryption report
[AD-A279294] p 1303 N95-21493
A simulation study of TCP performance in ATM networks
[DE94-016622] p 1477 N95-21505
Status of CFDLIB performance tests on the T3D
[DE95-002708] p 1478 N95-21925
A new parallel method for molecular dynamics simulation of macromolecular systems
[DE94-018621] p 1529 N95-22315

COMPUTER SYSTEMS PROGRAMS
The design and implementation of the functional/daplex data interface for the multimodel and multilingual database system
[AD-A280131] p 1587 N95-20039
Towards better quality and reliability in the software reuse library environment
[AD-A280013] p 1460 N95-20313
User interface software tools
[AD-A286056] p 1466 N95-21325
An IBM based ARINC interface
[ARL-TR-21] p 1471 N95-22104

COMPUTER TECHNIQUES
Optimal distributed control system for a linear distributed parameter system
[AD-D016583] p 1480 N95-20202
First principles simulation of materials properties
[DE94-016781] p 1566 N95-20405
Eta%-Superconvergence of Finite Element Approximations in the Interior of General Meshes of Triangles
[AD-A279903] p 1490 N95-20565
Study of superconvergence by a computer-based approach: Superconvergence of the gradient of the displacement, the strain and stress in finite element solutions for plane elasticity
[AD-A279885] p 1490 N95-20588
ECSU-AASERT summer research project in parallel processing and computer visualization
[AD-A285983] p 1475 N95-20618
The IEEE scalable coherent interface: An approach for a unified avionics network p 1212 N95-20650
VLUGr3: A vectorizable adaptive grid solver for PDEs in 3D. 2: Code description
[PB95-135737] p 1465 N95-21033
13th European Annual Conference on Human Decision Making and Manual Control
[PB95-132874] p 1450 N95-21284
Proceedings of the NATO-Advanced Study Institute on Computer Aided Analysis of Rigid and Flexible Mechanical Systems. Volume 2: Contributed papers
[AD-A286063] p 1381 N95-21488
The use of fuzzy set classification for pattern recognition of the polygraph
[AD-A279148] p 1470 N95-21971
Fast algorithms for transport models
[DE95-001702] p 1470 N95-21992
Activities of the Research Institute for Advanced Computer Science
[NASA-CR-197291] p 1478 N95-22108

COMPUTER VIRUSES
An abstract model of rogue code insertion into radio frequency wireless networks. The effects of computer viruses on the Program Management Office
[AD-A285759] p 1288 N95-19932

COMPUTER VISION
Tracking a dynamic set of feature points
[AD-A285124] p 1313 N95-20257
A scalable video rate camera interface
[AD-A286144] p 1474 N95-20325
Integration of segmentation and stereo matching
[PB95-107819] p 1444 N95-21028
Unknown-terrains navigation of a mobile robot using an array of sonars
[DE94-017902] p 1482 N95-21385
An image cancellation approach to depth-from-focus
[DE94-019312] p 1544 N95-21392
Feature extraction without edge detection
[AD-A279842] p 1473 N95-22386

COMPUTERIZED SIMULATION
High-performance packet switching architecture for ATM: Conventional solution and neural network solution
[PB95-110920] p 1312 N95-19935
Simulation of stellar speckle imaging
[DE94-016606] p 1412 N95-19985
Advanced detector development, laboratory simulations, diagnostic development, and data analysis on wake physics
[AD-A284798] p 1364 N95-20069
A computational study of projectile shape dependence on phase change phenomena with comparisons to experimental data
[DE95-000740] p 1384 N95-20077
Performance issues for engineering analysis on MIMD parallel computers
[DE94-015769] p 1474 N95-20150
SYNTH: A spectrum synthesizer
[DE94-015943] p 1458 N95-20153
Unified GUI for the Los Alamos Radiation Transport Code System
[DE94-016088] p 1458 N95-20154
Meshes: The next generation
[DE94-016702] p 1459 N95-20255
Numerical modeling of a small recirculating induction accelerator for heavy-ion fusion
[DE94-018549] p 1552 N95-20318
Simulation of large systems with neural networks
[DE94-018898] p 1428 N95-20319
Measuring presence in virtual environments
[AD-A286183] p 1460 N95-20326
New high temperature plasmas and sample introduction systems for analytical atomic emission and mass spectrometry
[DE94-018580] p 1552 N95-20345
High performance computing for materials process modeling
[DE94-017860] p 1460 N95-20358
BACKSCAT lidar simulation version 4.0: Technical documentation and users guide
[AD-A285851] p 1290 N95-20376
Implementation and performance of a three-dimensional numerical transport model
[PB95-135745] p 1402 N95-20440
Legged vehicle for underwater mobile operations
[AD-A285043] p 1480 N95-20482
Collected papers of the Soar/IFOR project, Spring 1994
[AD-A280063] p 1216 N95-20624
Computer graphics tools for visualizing gravity gradient torques on a rigid spacecraft
[AD-A285971] p 1461 N95-20665
Emitter location via Kalman filtering of signal time difference of arrival
[AD-A285972] p 1291 N95-20666
Simulation of tearing mode stabilization by using ECH
[DE94-770700] p 1554 N95-20684
EPICS simulation tools for control system development
[DE94-018082] p 1462 N95-20699
Use of an integrated design tool for weld quality enhancement
[DE94-018135] p 1379 N95-20723
HIVEL2D: A two-dimensional flow model for high-velocity channels
[AD-A286556] p 1341 N95-20843
Highlights of recent balance of system research and evaluation
[DE95-001626] p 1393 N95-20863
Approach to compact terawatt CO2 laser system for particle acceleration
[DE95-002170] p 1371 N95-20866
Advanced robotic technologies for transfer at Sandia National Laboratories
[DE95-001617] p 1481 N95-20884
COYOTE II: A finite element computer program for nonlinear heat conduction problems. Part 1: Theoretical background
[DE95-002587] p 1463 N95-20887
Performance and cost analysis of monolithic solid oxide fuel cells
[DE95-002511] p 1394 N95-20896
Modelling and simulation of HF/VHF MMPPs
p 1293 N95-20925
Proceedings of the Cloud Impacts on DOD Operations and Systems 1993 Conference (CIDOS 1993)
[AD-A286658] p 1430 N95-20974
Next generation solid modellers for electronic prototyping
[AD-A286525] p 1464 N95-21010
Simulation of the injection moulding process
[PB94-215555] p 1286 N95-21027
Application of Direct and Large Eddy Simulation to Transition and Turbulence
[AGARD-CP-551] p 1346 N95-21061
Developments and applications of dynamic models for large eddy simulation of complex flows
p 1346 N95-21062
Subgrid scale models in finite difference simulations of complex wall bounded flows p 1346 N95-21063
Large-eddy simulation of rotating channel flows using a localized dynamic model p 1346 N95-21064
The asymptotic state of rotating homogeneous turbulence at high Reynolds numbers
p 1347 N95-21065
Comparison of DNS and LES of transitional and turbulent compressible flow: Flat plate and mixing layer
p 1347 N95-21066
Direct numerical simulation of turbulent flow in a sudden pipe expansion p 1347 N95-21067

Simulation of separated flows p 1347 N95-21068
Simulation of large scale transitional flows
p 1348 N95-21075
Simulation of pipe flow p 1349 N95-21078
Simulations of bypass transition for spatially evolving disturbances p 1349 N95-21079
Direct numerical simulation for premixed turbulent combustion modelling p 1249 N95-21082
Entrainment in a shear-free turbulent mixing layer
p 1350 N95-21083
The effect of initial conditions on the development of temporally evolving planar three dimensional incompressible wakes p 1350 N95-21085
Spatial direct numerical simulation of boundary layer transition under strong adverse pressure gradient
p 1351 N95-21093
Direct simulation and graphics post-processing of three-dimensional turbulent flows p 1352 N95-21098
Control of complex multibody spacecraft
[AD-A285623] p 1220 N95-21147
Computer model predictions of the local effects of large, solid-fuel rocket motors on stratospheric ozone
[AD-A285632] p 1404 N95-21150
Simulation of rotor blade element turbulence
[NASA-TM-108862] p 1207 N95-21186
Real-time dynamic simulator for the Topaz II reactor power system
[DE95-001604] p 1535 N95-21278
Effects of battery technologies, driving patterns, and climate comfort control on the performance of electric vehicles
[DE95-001102] p 1329 N95-21296
Defect production and recombination during low-energy ion processing
[DE95-001827] p 1572 N95-21304
Simulation of beam-beam lifetime for LEP
[DE95-002888] p 1536 N95-21334
Calculation of atom-centered partial charges for heme
[DE94-014447] p 1520 N95-21375
Computer simulation of the diocotron instability
[AD-A285655] p 1559 N95-21403
Three-dimensional effects for radio frequency antenna modeling
[DE94-019125] p 1303 N95-21459
Structure of ionic interfaces from an absolutely convergent solution of the Madelung problem
[DE94-019268] p 1573 N95-21474
Simulations of metal dissolution and corrosion
[DE94-019295] p 1257 N95-21476
Unified very low stratus cloud/subcloud microphysics model: User's guide
[AD-A286454] p 1430 N95-21586
Simulated rarefied entry of the Galileo probe into the atmosphere of Jupiter
[NASA-TM-110507] p 1601 N95-21621
Flow and heat transfer simulation in a flash smelting furnace
[PB95-108197] p 1354 N95-21649
The application of a statistical analysis software package to explosive testing
[MRL-TR-93-42] p 1284 N95-21658
A preliminary study of the airwake model used in an existing SH-60B/FFG-7 helicopter/ship simulation program
[DSTO-TR-0015] p 1201 N95-21659
Adaptive capture of expert behavior
[DE94-018285] p 1483 N95-21710
Hires and beyond p 1592 N95-21750
EAGLES 1.1: A microcomputer software package for analyzing fuel efficiency of electric and gasoline vehicles
[DE95-001119] p 1469 N95-21829
Directed light fabrication
[DE94-018293] p 1375 N95-21837
A massively parallel algorithm for grand canonical Monte Carlo computer simulation with the short-ranged Lennard-Jones potential
[DE94-010396] p 1477 N95-21843
Tethered satellite: Forces and motion
[NASA-TM-110518] p 1220 N95-21858
Cochannel and adjacent-channel interference in nonlinear minimum-shift-keyed satellite system
[NASA-TM-106834] p 1307 N95-21890
A syncopated leap-frog algorithm for orbit consistent plasma simulation of materials processing reactors
[DE95-000954] p 1561 N95-21922
Status of CFDLIB performance tests on the T3D
[DE95-002708] p 1478 N95-21925
Critical dynamics and plastic flow in disordered Josephson junction arrays
[DE94-629074] p 1576 N95-21995
Standard data formats for simulation
[PB95-110367] p 1470 N95-22016
Economic feasibility analysis of distributed electric power generation based upon the natural gas-fired fuel cell
[DE94-012277] p 1396 N95-22033
The 9th INS scientific computational programs
[DE94-770780] p 1526 N95-22051
Artificial neural network metamodels of stochastic computer simulations
[AD-A285951] p 1484 N95-22056
Solving the inverse problem in terrain modeling
[AD-A285860] p 1391 N95-22131
Latin hypercube sampling in sensitivity analysis
[AD-A285867] p 1499 N95-22135
Users guide to NCEMSS, version 2.0
[DE95-003443] p 1548 N95-22238
High performance computing for beam physics applications
[DE94-018312] p 1539 N95-22243
Manufacturing Technology Bulletin, July 1994
[DE94-017775] p 1605 N95-22262
Modeling of fundamental phenomena in welds
[DE94-017859] p 1381 N95-22268
An improved Monte Carlo algorithm for simulating grain growth
[DE94-017903] p 1578 N95-22272
On conception of a compact neutron source and the possibility of its simulation on the Amba-M end trap
[DE94-633373] p 1562 N95-22282
Recent results in analysis and simulation of beam halo
[DE94-018313] p 1539 N95-22298
3-D TECATE/BREW: Thermal, stress, and birefringent ray-tracing codes for solid-state laser design
[DE95-000330] p 1376 N95-22301
A new parallel method for molecular dynamics simulation of macromolecular systems
[DE94-018621] p 1529 N95-22315
On the dynamics of a shock-bubble interaction
[NASA-CR-194978] p 1495 N95-22325
Simulation of structural response using a recurrent radial basis function network
[DE94-017342] p 1486 N95-22409
PIC simulation of surface waves
[AD-A285358] p 1563 N95-22422
Experimental evaluation of dynamic data allocation strategies in a distributed database with changing workloads
[NASA-CR-195024] p 1456 N95-22431
Annual research briefs, 1994
[NASA-CR-197352] p 1358 N95-22437
Notes on rotating turbulence p 1359 N95-22444
A dynamic localization model with stochastic backscatter p 1359 N95-22445
Local dynamic subgrid-scale models in channel flow
p 1360 N95-22447
Unstructured-grid large-eddy simulation of flow over an airfoil p 1202 N95-22448
Large-eddy simulation of flow through a plane, asymmetric diffuser p 1360 N95-22449
Large-eddy simulation of a boundary layer with concave streamwise curvature p 1360 N95-22450
Direct numerical simulations of on-demand vortex generators: Mathematical formulation
p 1361 N95-22452
Optimal active control for Burgers equations
p 1361 N95-22454
Numerical study of boundary layer interaction with shocks: Method and code validation
p 1362 N95-22461
Resolution requirements for velocity gradients in turbulence p 1363 N95-22462
A method for obtaining a statistically stationary turbulent free shear flow p 1363 N95-22463
Direct numerical simulation of incompressible axisymmetric flows p 1363 N95-22464
Databases post-processing in Tensoral
p 1363 N95-22465

COMPUTERS
The demise of plastic encapsulated microcircuit myths
p 1209 N95-20640
The opportunities for and challenges of common integrated electronics
[AD-A279991] p 1327 N95-20966
HPCC technology awareness program: Improved economic competitiveness through technology awareness, transfer and application
[DE95-002134] p 1476 N95-21355
Quantitative evaluation of wrist posture and typing performance: A comparative study of 4 computer keyboards
[DE95-002392] p 1452 N95-21358
GRONICs-1994. Proceedings of the 1994 Groningen Student Conference on Computer Science
[PB95-135620] p 1468 N95-21455
Advanced computing systems: Usability of knowledge-based planning systems
[AD-A279573] p 1477 N95-21698
Top ten list of user-hostile interface design
[DE95-001602] p 1453 N95-21721
Evaluation of scanners for C-scan imaging for nondestructive inspection of aircraft
[AD-A286398] p 1383 N95-22202
Adaptive fault-resistant systems
[AD-A286406] p 1484 N95-22203
Time and the order of abstract events in distributed computations
[PB95-110482] p 1496 N95-22349
FORTRAN subroutine for column reduction of polynomial matrices
[PB95-134987] p 1497 N95-22379

CONCATENATED CODES
Adaptive error-control scheme for 2-200 MHz Multiple-Mechanism Propagation Paths
p 1293 N95-20926

CONCENTRATION (COMPOSITION)
Ignition of submarine materials at various oxygen concentrations
[PB95-131371] p 1243 N95-21428
Derivation of preliminary maximum permissible concentrations of volatile compounds in air
[PB95-107447] p 1410 N95-22125

CONCENTRATORS
BMDO photovoltaics program overview
p 1316 N95-20504
An update on the development of a line-focus refractive concentrator array p 1322 N95-20534
An introduction to the Astro Edge solar array
p 1322 N95-20535
Si concentrator solar cell development
[DE95-002314] p 1393 N95-20870
Development of concentrator solar cells
[DE95-002316] p 1394 N95-20871

CONCRETES
Fibre-reinforced high-strength concrete
[PB95-131942] p 1232 N95-22158

CONCURRENT ENGINEERING
Automation support for concurrent software engineering
[AD-A279691] p 1461 N95-20579
An MCM concurrent engineering software tool market study
[AD-A279257] p 1468 N95-21489

CONCURRENT PROCESSING
Non interleaving process algebra
[PB95-110607] p 1486 N95-19892
Using local optimality criteria for efficient information retrieval with redundant information filters
[AD-A279603] p 1587 N95-20302
Multi-dimensional Petri nets
[PB95-127593] p 1491 N95-21024
Regularity of BPa-systems is decidable
[PB95-135489] p 1468 N95-21619
Computing symmetries and stubborn sets
[PB95-127700] p 1472 N95-22328

CONDENSED MATTER PHYSICS
Israel Physical Society Annual Meeting 1994
[DE94-630140] p 1565 N95-20261
Neutron Compton scattering
[PB95-130290] p 1530 N95-22332

CONDENSING
Solar system formation and the distribution of volatile species p 1421 N95-21806

CONDITIONING (LEARNING)
Biological and theoretical studies of adaptive networks: The conditioned response
[AD-A284781] p 1479 N95-20061

CONDUCTING FLUIDS
Role of dielectric constant in electrohydrodynamics of conducting fluids
[NASA-TM-110499] p 1331 N95-21614
Measurement of the thermal properties of electrically conducting fluids using coated transient hot wires
[DE94-017816] p 1357 N95-22264

CONDUCTING POLYMERS
The organic chemistry of conducting polymers
[DE94-018216] p 1270 N95-20680
Conducting thermoset polymers
[AD-A286541] p 1273 N95-21014

CONDUCTION BANDS
Angle resolved photoemission on K(0.3)Mo3, TiTe2 and Ti(1 + x)S2
[DE94-018300] p 1574 N95-21712

CONDUCTIVE HEAT TRANSFER
Simulation of tearing mode stabilization by using ECH
[DE94-770700] p 1554 N95-20684
Meso-scale cooling effects of high albedo surfaces: Analysis of meteorological data from White Sands National Monument and White Sands Missile Range
[DE94-018535] p 1429 N95-20782
An augmented Young-Laplace model of an evaporating meniscus in a micro-channel with high heat flux
[NASA-CR-197622] p 1340 N95-20796

COYOTE II: A finite element computer program for nonlinear heat conduction problems. Part 1: Theoretical background
[DE95-002587] p 1463 N95-20887
Self-similar solutions of a fast diffusion equation that do not conserve mass
[PB95-134920] p 1497 N95-22375

CONDUCTORS
Current distribution in Cable-In-Conduit Conductors
[DE95-001820] p 1332 N95-21725

CONFERENCES
Physics and applications of defects in advanced semiconductors, volume 325
[AD-A280059] p 1563 N95-19886
Technical Summary for 1993 fall MRS Symposium O, Complex Fluids
[AD-A283722] p 1264 N95-19972
Technical digest: Eighth Symposium on Optical Fiber Measurements
[PB94-207636] p 1540 N95-19976
Proceedings of the 1994 DOE/NREL Hydrogen Program Review
[DE94-011835] p 1234 N95-20117
Proceedings of the 1993 Non-Fluorocarbon Insulation, Refrigeration and Air Conditioning Technology Workshop
[DE94-018333] p 1285 N95-20194
Second European Symposium on X-Ray Topography and High Resolution Diffraction: Programme and abstracts
[AD-A286328] p 1564 N95-20210
Proceedings of the 4th International Conference on Electrorheological Fluids
[AD-A286341] p 1266 N95-20227
Journal of Applied Physics, volume 76, number 10, part 2. Proceedings of the 6th Joint Magnetism and Magnetic Materials-INTERMAG Conference
[AD-A286364] p 1500 N95-20229
24th Annual Anomalous Absorption Conference
[DE94-016457] p 1551 N95-20283
The First NREL Conference on Thermophotovoltaic Generation of Electricity: Proceedings
[DE94-011831] p 1391 N95-20332
D0 quantum chromodynamics: A compilation of results presented at DPF 1994
[DE95-000838] p 1510 N95-20344
Anaerobic Treatment of Municipal Solid Waste and Sludge for Energy Production and Recycling of Nutrients
[DE95-700217] p 1315 N95-20369
Proceedings of the International Wire and Cable Symposium
[AD-A279242] p 1403 N95-20465
T-45A High Angle of Attack Testing: US Naval Test Pilot School 46th Annual Reunion and Symposium
[AD-A284000] p 1207 N95-20466
Proceedings of the 13th Space Photovoltaic Research and Technology Conference (SPRAT 13)
[NASA-CP-3278] p 1316 N95-20502
Proceedings of the 4th Systems Reengineering Technology Workshop
[AD-A285357] p 1460 N95-20546
Biomolecular Materials by Design, volume 330
[AD-A285369] p 1269 N95-20551
The 29th MIL-HDBK-17 Polymer Matrix Composites Coordination Group Meeting
[AD-A279917] p 1269 N95-20578
Advanced Packaging Concepts for Digital Avionics
[AGARD-CP-562] p 1208 N95-20631
Annual Conference on Fire Research: Book of abstracts
[PB95-104964] p 1286 N95-20717
Proceedings of the Zel'Dovich Memorial International Conference on Combustion, Detonation, Shock Waves, volume 2
[AD-A286626] p 1239 N95-20769
The 37th Military Librarians Workshop on Global Information: The Sun Never Sets
[AD-A286636] p 1588 N95-20774
Gordon Research Conference on Physical Electrochemistry
[AD-A286545] p 1240 N95-20842
Multiple Mechanism Propagation Paths (MMPPs): Their Characterisation and Influence on System Design
[AGARD-CP-543] p 1292 N95-20921
Seminar on Biomedical Engineering 1993
[PB95-104402] p 1443 N95-20971
Proceedings of the Cloud Impacts on DOD Operations and Systems 1993 Conference (CIDOS 1993)
[AD-A286658] p 1430 N95-20974
Proceedings of the Fourth International Workshop on Inductive Logic Programming (ILP-94)
[PB95-135273] p 1464 N95-21003
Studying Turbulence Using Numerical Simulation Databases. 5: Proceedings of the 1994 Summer Program
[NASA-CR-197362] p 1341 N95-21035
Application of Direct and Large Eddy Simulation to Transition and Turbulence
[AGARD-CP-551] p 1346 N95-21061
Proceedings of the NATO-Advanced Study Institute on Computer Aided Analysis of Rigid and Flexible Mechanical Systems. Volume 1: Main lectures
[AD-A286062] p 1380 N95-21171
13th European Annual Conference on Human Decision Making and Manual Control
[PB95-132874] p 1450 N95-21284
Second International Conference on Ordinal Data Analysis
[AD-A279756] p 1590 N95-21401
GRONICs-1994. Proceedings of the 1994 Groningen Student Conference on Computer Science
[PB95-135620] p 1468 N95-21455
Proceedings of the NATO-Advanced Study Institute on Computer Aided Analysis of Rigid and Flexible Mechanical Systems. Volume 2: Contributed papers
[AD-A286063] p 1381 N95-21488
International Conference on Control and Estimation of Distributed Parameter Systems: Nonlinear Phenomena
[AD-A286449] p 1493 N95-21582
Fourth International Symposium on Stratified Flows, volume 1
[AD-A286450] p 1354 N95-21583
Fourth International Symposium on Stratified Flows, volume 3
[AD-A286452] p 1354 N95-21584
Proceedings of the School for Young High Energy Physicists
[PB95-108114] p 1537 N95-21647
Proceedings of the 5th Workshop on the Next Generation of CASE Tools
[PB95-135208] p 1469 N95-21716
Science with High Spatial Resolution Far-Infrared Data
[NASA-CR-197353] p 1595 N95-21749
Conference on Deep Earth and Planetary Volatiles
[NASA-CR-196944] p 1415 N95-21777
Solar system formation and the distribution of volatile species p 1421 N95-21806
The Use of Cyanobacteria to Explore Basic Biological Processes
[DE94-019238] p 1440 N95-22066
Conference proceedings. Defense Modeling and Simulation Office Information/Data Base (I/DB) Task Group Meetings, and notes from the previous two I/DB meetings
[AD-A279097] p 1591 N95-22069
The role of point defects and defect complexes in silicon device processing
[DE94-011876] p 1279 N95-22091
International Symposium on Advanced Laser Technologies
[AD-A279849] p 1376 N95-22164
Surface technology programme
[PB95-132866] p 1262 N95-22174
Proceedings: International Symposium on Global Change (IGBP)
[DE94-765351] p 1410 N95-22219
Theses of the Proceedings of the 23d International Meeting on the Physics of Charged Particle Interaction with Crystals
[DE94-631501] p 1529 N95-22281
Transactions of the Eleventh Army Conference on Applied Mathematics and Computing
[AD-A279884] p 1497 N95-22389
Indian Academy of Sciences. Volume 105, number 6, December 1993. Proceedings of the 2nd International Conference on Solar Energy Storage Applied Photochemistry
[AD-A286481] p 1605 N95-22394
Cellular responses to environmental DNA damage
[DE94-015606] p 1441 N95-22397
Advanced Materials and Process Technology for Mechanical Failure Prevention (proceedings of the 48th Meeting of the Mechanical Failures Prevention Group
[AD-A285785] p 1233 N95-22399
Proceedings of the 4th Annual Major Range and TestFacility Base (MRTFB) Environmental Workshop
[AD-A285779] p 1411 N95-22414
Fourth International Symposium on Stratified Flows, volume 4
[AD-A286453] p 1358 N95-22424

CONFIDENCE LIMITS
Iterated-bootstrap confidence intervals for the mean
[AD-A279802] p 1498 N95-20102
Search for D(+) yields (pi)(+)(mu)(+)(mu)(-)
[DE94-015538] p 1512 N95-20475
Precedence tests and confidence bounds for complete data: An overview and some results
[PB95-132668] p 1499 N95-21980

CONFIGURATION INTERACTION
D(sup 0)-(anti-D)(sup 0) mixing and doubly Cabibbo-suppressed decays of the D(+)
[DE94-015540] p 1512 N95-20476
The evolution of configuration from q greater than 1 to q less than 1
[DE94-631396] p 1556 N95-21162

CONFINEMENT
Confinement and stability of crystalline beams in storage rings
[DE95-002515] p 1533 N95-20886
Ideal Magnetohydrodynamic stabilities in JT-60 and D3-D tokamak plasmas
[DE94-770684] p 1555 N95-20987
Investigations of VH-mode in D3-D and JET
[DE94-015859] p 1556 N95-21142
Experimental investigation of molecular beam injection in HL-1 tokamak
[DE94-631456] p 1556 N95-21165
Review of recent D-T experiments from TFTR
[DE95-002755] p 1557 N95-21239
Monopoles and quark confinement: Introduction and overview
[DE94-019348] p 1522 N95-21485

CONGRESSIONAL REPORTS
Naval aviation: F-14 upgrades are not adequately justified. Report to Congressional Committees
[AD-A286338] p 1206 N95-20212
Environmental cleanup: Too many high priority sites impede DOD's program. Report to the Chairman, Committee on Governmental Affairs, US Senate
[AD-A279511] p 1407 N95-21683
Technology transfer: Improving the use of cooperative R/D agreement at DOE's contractor-operated laboratories. Report to Congressional requesters
[GAO/RCED-94-91] p 1586 N95-22403

CONGRUENCES
Quadratic forms in design theory
[PB95-111019] p 1487 N95-19940

CONJUGATE GRADIENT METHOD
Iterated-subspace minimization methods for nonlinear optimization
[PB95-108171] p 1495 N95-22317

CONJUGATES
Beam flavor dependence in the hadroproduction of D(+-) and D(sub s)(+-) mesons
[DE94-015541] p 1530 N95-22339

CONNECTORS
A technique for increasing the bandwidth of high performance electrical backplanes p 1212 N95-20651
Ab initio potential energy surface for H + OCS reactions: Extended basis sets and correlation treatment
[AD-A286420] p 1247 N95-22207

CONSERVATION
Unbinned maximum likelihood fit for the CP conserving couplings for W + photon production at CDF
[DE95-001471] p 1514 N95-20852
On the Taylor test. Part 3: A continuum mechanics code analysis of steady plastic wave propagation
[DE95-002252] p 1501 N95-20869
Self-similar solutions of a fast diffusion equation that do not conserve mass
[PB95-134920] p 1497 N95-22375

CONSERVATION EQUATIONS
General conservative extension theorem in process algebra
[PB95-110656] p 1487 N95-19902
The coupling between flame surface dynamics and species mass conservation in premixed turbulent combustion p 1249 N95-21041

CONSERVATION LAWS
Approximate Riemann solver for magnetohydrodynamics (that works in more than one dimension)
[PB95-135802] p 1553 N95-20425
Symmetry, Wigner functions and particle reactions
[DE94-629887] p 1514 N95-20735
Numerical wave speed for one-dimensional scalar hyperbolic conservation laws with source terms
[PB95-127536] p 1492 N95-21371
On the wavelet optimized finite difference method
[NASA-CR-191601] p 1495 N95-22157

CONSISTENCY
The Lorentz reciprocity theorem as a consistency test for propagation models p 1295 N95-20937
Compositional approach to sequential consistency and lazy caching
[PB95-134110] p 1455 N95-21871

CONSTANTS
Natural gas combustion chemistry mechanisms research
[PB95-111670] p 1247 N95-22150

CONSTRAINTS
New method for integrity constraint checking in deductive databases
[PB95-110672] p 1586 N95-19904
Constraints on SUSy-GUT unification from b yields s-gamma decay
[PB95-130373] p 1580 N95-21229

CONSTRUCTION
Design and construction of the HSX experiment
[DE94-018657] p 1552 N95-20348
The impact of partnering on construction contracts
[AD-A286588] p 1585 N95-20855
Neural network construction via back-propagation
[DE95-002867] p 1482 N95-21249
Aeronautical engineering: A continuing bibliography with indexes (supplement 315)
[NASA-SP-7037(315)] p 1199 N95-21640
Environmental Compliance Assessment and Management Program (ECAMP), South Carolina supplement
[AD-A279533] p 1408 N95-21689
CONTACT LOADS
On the origins and modeling of frictional behavior in interfacially-complex sliding contacts
[DE94-019129] p 1381 N95-21601
CONTAMINANTS
Resonance Raman spectroscopy of volatile organics: Carbon tetrachloride
[DE95-000627] p 1233 N95-19980
Surface characterization and contamination analysis
[NASA-CR-197374] p 1238 N95-20557
Evaluation of an immobilized cell bioreactor for degradation of meta- and para-nitrobenzoate
[AD-A279719] p 1516 N95-20993
Numerical study of contaminant effects on combustion of hydrogen, ethane, and methane in air
[NASA-TM-106844] p 1284 N95-22114
Gas-phase photocatalytic oxidation: Cost comparison with other air pollution control technologies
[DE95-000241] p 1410 N95-22278
CONTAMINATION
The in-situ fracture and Auger analysis of Nicalon fibers
[DE94-017771] p 1226 N95-20357
Monitoring bioremediation of Volatile Organic Compounds (VOCs) using Fourier Transform Infrared (FT-IR) spectrometry
[AD-A279631] p 1403 N95-20456
Liquid xenon as a potential laser host medium
[AD-A285365] p 1370 N95-20550
Surface characterization and contamination analysis
[NASA-CR-197374] p 1238 N95-20557
Aging tests of ethylene contaminated argon/ethane
[DE95-002526] p 1282 N95-20899
Fiber-optic sensors for rapid, inexpensive characterization of soil and ground water contamination
[DE95-002471] p 1545 N95-21510
Surface inspection using Fourier Transform Infrared Spectroscopy
[DE95-001699] p 1244 N95-21571
Environmental cleanup: Too many high priority sites impede DOD's program. Report to the Chairman, Committee on Governmental Affairs, US Senate
[AD-A279511] p 1407 N95-21683
D/H ratios and H2O contents of mantle-derived amphibole megacrysts from Dish Hill, California
p 1416 N95-21781
Primitive Xe in the atmospheres of Earth and mars
p 1419 N95-21795
CONTEXT FREE LANGUAGES
Connectionist models for intelligent computation
[AD-A286436] p 1484 N95-22210
CONTINENTAL SHELVES
Long term changes on the continental shelf of the North Sea: Invertebrate trends, 1931-1990
[PB95-135224] p 1435 N95-21717
CONTINUOUS RADIATION
Threshold detection in the presence of atmospheric turbulence
[AD-A286175] p 1427 N95-22249
CONTINUOUS WAVE LASERS
Application of a dimensionless parameter model for Laser Beam Welding
[DE94-018902] p 1378 N95-20048
Optical power limiting liquid crystal composites
[AD-A286605] p 1569 N95-20767
Tunable CW blue, green, orange and red upconversion fiber lasers at room temperature
[DE95-000851] p 1375 N95-22007
CONTINUOUS WAVE RADAR
Millimeter wave front-end figure of merit, part 1
[AD-A279093] p 1307 N95-21915
CONTINUUM FLOW
Continuum transient and frozen startup behavior of conventional and gas-loaded heat pipes
[AD-A284297] p 1339 N95-20250
CONTINUUM MECHANICS
On the Taylor test. Part 3: A continuum mechanics code analysis of steady plastic wave propagation
[DE95-002252] p 1501 N95-20869
CONTINUUM MODELING
Accurate solution algorithms for incompressible multiphase flows
[DE95-002727] p 1353 N95-21317
Domain processes in ferroelectric ceramics
[AD-A279567] p 1276 N95-21697
CONTINUUMS
Correlation of far-infrared emission and radio continuum emission along the major axis of edge-on spiral galaxies
p 1593 N95-21762
Two-dimensional maps of the infrared-to-radio ratio in spiral galaxies p 1593 N95-21765
CONTOURS
Stars or stripes: A comparative study of finite and transfinite techniques for surface modelling
[PB95-134979] p 1464 N95-20975
Visualizing 3D velocity fields near contour surfaces
[DE95-000841] p 1353 N95-21182
N=1 Superconformal minimal model correlation functions on the torus
[PB95-134615] p 1500 N95-21964
CONTRACT MANAGEMENT
An analysis of cost overruns on defense acquisition contracts p 1584 N95-20749
The impact of partnering on construction contracts
[AD-A286588] p 1585 N95-20855
Annual program analysis of the NASA Space Life Sciences Research and Education Support Program
[NASA-CR-197298] p 1439 N95-21529
Technology transfer: Improving the use of cooperative R/D agreement at DOE's contractor-operated laboratories. Report to Congressional requesters
[GAO/RCED-94-91] p 1586 N95-22403
CONTRACT NEGOTIATION
The impact of partnering on construction contracts
[AD-A286588] p 1585 N95-20855
CONTRACTION
Beyond beta-reduction in Church's lambda yield
[PB95-110565] p 1488 N95-20149
CONTRACTORS
The advantages of cost plus award fee contracts
p 1584 N95-20745
CONTRACTS
The impact of partnering on construction contracts
[AD-A286588] p 1585 N95-20855
CONTROL
Automation support for concurrent software engineering
[AD-A279691] p 1461 N95-20579
CONTROL DATA (COMPUTERS)
The GPS Burst Detector W-Sensor
[DE94-017406] p 1204 N95-20269
CONTROL EQUIPMENT
Design of power electronics for TVC and EMA systems
[NASA-CR-196540] p 1312 N95-19909
CONTROL SIMULATION
Control of complex multibody spacecraft
[AD-A285623] p 1220 N95-21147
CONTROL STABILITY
Temporal evolution of turbulence/chemistry interactions in lifted, turbulent-jet flames
[DE95-002481] p 1243 N95-21512
CONTROL SURFACES
Launch vehicle flight control augmentation using smart materials and advanced composites (CDDF Project 93-05)
[NASA-TP-3535] p 1218 N95-21346
Translational-energy-resolved studies of photographed carrier-induced reactions on semiconductor surfaces
[DE95-002944] p 1573 N95-21444
CONTROL SYSTEMS DESIGN
Toward a design for the ITER plasma shape and stability control system
[DE94-017516] p 1548 N95-20037
Force based motion control of a walking machine
[PB95-129672] p 1451 N95-20276
System design document U-AVLIS control system architecture
[DE94-017297] p 1460 N95-20387
Preliminary control system design and analysis for the Space Station Furnace Facility thermal control system
[NASA-TM-108476] p 1365 N95-20560
Design of a controller for a flexible pointing system using H(infinity) synthesis
[AD-A286572] p 1481 N95-20828
Control of complex multibody spacecraft
[AD-A285623] p 1220 N95-21147
Two-micron Laser Atmospheric Wind Sounder (LAWS) pointing/tracking study
[NASA-CR-195012] p 1220 N95-21190
Communications and control for electric power systems: Power system stability applications of artificial neural networks
[NASA-CR-197594] p 1483 N95-21613
Sensor based fine motion control
[PB95-108007] p 1483 N95-21669
Adaptive capture of expert behavior
[DE94-018285] p 1483 N95-21710
RF beam control for the AGS Booster
[DE95-001485] p 1538 N95-21720
Multi-port tester interface
[AD-D016240] p 1332 N95-21775
Design of robust optimal control systems and stability analysis of real structured uncertainties
[AD-A279089] p 1483 N95-21913
Optimal control of a two wheeled mobile robot
[AD-A286130] p 1485 N95-22233
Low-level RF control for the AFEL
[DE94-018295] p 1540 N95-22410
CONTROL THEORY
Summary of a joint program of research into aircraft flight control concepts
[AD-A280012] p 1214 N95-20004
Analytic Perturbation Analysis of Discrete Event Dynamic Systems
[DE94-018635] p 1480 N95-20126
A physiological neural network for saccadic eye movement control
[AD-A279599] p 1441 N95-20301
Performance measurement: A tool for program control
p 1585 N95-20752
Program control for mission success
p 1585 N95-20753
The MSFC Program Control Development Program
p 1585 N95-20754
Riccati equation theory for Pritchard-Salamon systems: A Popov function approach
[PB95-137089] p 1491 N95-20830
International Conference on Control and Estimation of Distributed Parameter Systems: Nonlinear Phenomena
[AD-A286449] p 1493 N95-21582
Semi-global stabilization of linear discrete-time systems subject to input saturation via linear feedback: An ARE-based approach
[PB95-135463] p 1483 N95-21618
Discrete algebraic Riccati equation and linear matrix inequality
[PB95-133575] p 1484 N95-22139
Mathematical theory of neural networks
[AD-A286508] p 1485 N95-22213
Quadratic optimal control of a delay equation II: The unstable case
[PB95-127064] p 1486 N95-22366
Quadratic optimal control of a delay equation I: The stable case
[PB95-127072] p 1486 N95-22367
Pollution error in the H-version of the finite element method and the local quality of A-posteriori error estimators
[AD-A279868] p 1497 N95-22388
Optimal active control for Burgers equations
p 1361 N95-22454
CONTROLLABILITY
Stabilization and control problems in structural dynamics
[AD-A279996] p 1340 N95-20312
CONTROLLED FUSION
Boron carbide-based coatings on graphite for plasma facing components
[DE94-017976] p 1269 N95-20570
Laser design basis for the National Ignition Facility
[DE94-016700] p 1534 N95-21209
CONTROLLERS
A photophysical control mechanism for zeaxanthin-associated radiationless energy dissipation in photosynthesis
[DE94-018383] p 1437 N95-19969
Robust agent control of an autonomous robot with many sensors and actuators
[AD-A280148] p 1479 N95-20011
The control system position to the electric probe in the Tokamak Novillo
[DE94-629938] p 1550 N95-20204
Preliminary control system design and analysis for the Space Station Furnace Facility thermal control system
[NASA-TM-108476] p 1365 N95-20560
Design of a controller for a flexible pointing system using H(infinity) synthesis
[AD-A286572] p 1481 N95-20828
Non-intrusive SCSI status sensing system
[AD-D016242] p 1476 N95-21307
Network file server with automatic sensing means
[AD-D016250] p 1476 N95-21496
SCSI controller with target status retrieval
[AD-D016249] p 1476 N95-21504
Sensor based fine motion control
[PB95-108007] p 1483 N95-21669

SEU and SEL response of the Westinghouse 64K E-2PROM, analog devices AD7876 12-bit ADC, and the Intel 82527 Serial Communications Controller
[DE95-003349] p 1334 N95-22086
Method of sensing target status in a local area network
[AD-D016248] p 1478 N95-22090
Method of non-intrusively sensing status in a computer peripheral
[AD-D016241] p 1478 N95-22146
Radiation characterization report for the GPS Receiver microcontroller chip
[DE94-019169] p 1335 N95-22165
Robust fixed-structure control
[AD-A286515] p 1485 N95-22216

CONVECTION
The initiation of lightning and the growth of electric fields in thunderstorms
[AD-A280033] p 1428 N95-20008
Effects of microphysics and radiation on mesoscale processes of a midlatitude squall line
[DE94-014732] p 1429 N95-20381
Fourth International Symposium on Stratified Flows, volume 1
[AD-A286450] p 1354 N95-21583
Modeling the effect of water on mantle rheology
p 1417 N95-21783
Mantle devolatilization and rheology in the framework of planetary evolution p 1418 N95-21788
Volatiles, rheology, and mantle convection: Comparing Earth, Venus, and Mars p 1420 N95-21801
A simulation of plasma motion in the polar ionosphere
[AD-A286166] p 1426 N95-22019

CONVECTION-DIFFUSION EQUATION
Multigrid with matrix-dependent transfer operators for convection-diffusion problems
[PB95-110821] p 1487 N95-19915

CONVECTIVE HEAT TRANSFER
Rainfall rates and the vertical distribution of diabatic heating components over tropical oceans
[NASA-CR-197603] p 1428 N95-19948
A computer code (SKINTEMP) for predicting transient missile and aircraft heat transfer characteristics
[AD-A286044] p 1341 N95-21001
Instabilities in natural-convection flows in cavities
[PB95-107975] p 1354 N95-21578

CONVERGENCE
Eta%-Superconvergence of Finite Element Approximations in the Interior of General Meshes of Triangles
[AD-A279903] p 1490 N95-20565
A convergence analysis of an h-version finite element method with high order elements for two dimensional elasto-plasticity problems
[AD-A279975] p 1491 N95-20920
Convergence acceleration of the Proteus computer code with multigrid methods
[NASA-CR-197677] p 1467 N95-21450
Structure of ionic interfaces from an absolutely convergent solution of the Madelung problem
[DE94-019268] p 1573 N95-21474
Recycling of volatiles at subduction zones: Noble gas evidence from the Tabar-Lihir-Tanga-Feni arc of papua New Guinea p 1418 N95-21787
Iterated-subspace minimization methods for nonlinear optimization
[PB95-108171] p 1495 N95-22317

CONVERGENT-DIVERGENT NOZZLES
Static investigation of two fluidic thrust-vectoring concepts on a two-dimensional convergent-divergent nozzle
[NASA-TM-4574] p 1199 N95-19913

CONVERSION
Transient studies of low temperature catalysts for methane conversion
[DE95-003560] p 1247 N95-22224

CONVERTERS
Natural gas converter performance and durability
[PB95-135554] p 1284 N95-21966

CONVEXITY
Set functionals in stochastic geometry
[PB95-135372] p 1491 N95-21005
Design of robust optimal control systems and stability analysis of real structured uncertainties
[AD-A279089] p 1483 N95-21913

CONVOLUTION INTEGRALS
Deconvolution and singular value decomposition
[AD-A286582] p 1491 N95-20875
Turbo codes for deep-space communications
p 1304 N95-21535

COOLANTS
Immersion/two phase cooling p 1211 N95-20648
MHD pressure drop in ducts with imperfectly insulating coatings
[DE95-002852] p 1558 N95-21244

COOLING
Solidification modeling of a spiral casting to determine material fluidity
[DE94-018930] p 1285 N95-20050
FASTPACK: Optimized solutions for modular avionics derived from a parametric study. Part 2: Avionics
p 1209 N95-20635
Immersion/two phase cooling p 1211 N95-20648
Meso-scale cooling effects of high albedo surfaces: Analysis of meteorological data from White Sands National Monument and White Sands Missile Range
[DE94-018535] p 1429 N95-20782
Time behavior and frequency response of the microwave propagation channel during multipath propagation
p 1296 N95-20942
Microclimate cooling effect on perceived exertion in four heat/exercise scenarios
[AD-A285549] p 1444 N95-21160
Toughened Silcomp composites for gas turbine engine applications
[DE95-002851] p 1214 N95-21243
Theory and modelling of quench in cable-in-conduit superconducting magnets
[DE95-001819] p 1330 N95-21442
Heat loss by helicity injection in spheromaks
[DE95-003473] p 1562 N95-22221

COOLING FINS
Liquid-metal pin-fin pressure drop by correlation in cross flow
[DE94-017086] p 1338 N95-19923

COOLING SYSTEMS
Module cooling system
[AD-D016584] p 1315 N95-20436
Microclimate cooling effect on perceived exertion in four heat/exercise scenarios
[AD-A285549] p 1444 N95-21160

COORDINATES
SAR image registration in absolute coordinates using GPS carrier phase position and velocity information
[DE94-018738] p 1204 N95-20195

COPOLYMERIZATION
Reactive compatibilization of polymer blends
[AD-A284836] p 1263 N95-19893

COPOLYMERS
Polyurethane-epoxy interpenetrating polymer network acoustic damping material
[AD-D016567] p 1266 N95-20293
Responsive copolymers for enhanced petroleum recovery
[DE94-018822] p 1267 N95-20350
The role of high pressure in the study and applications of the ferroelectric polymer polyvinylidene fluoride and its copolymers
[DE94-015742] p 1268 N95-20396
Topography of neutron scattering from diblock copolymer film
[DE95-001457] p 1229 N95-20840
Neutron reflectivity study of adsorbed diblock copolymers
[DE95-002740] p 1281 N95-22434

COPPER
Direct catalytic decomposition of nitric oxide
[DE94-018840] p 1233 N95-20045
Investigation of syngas interaction in alcohol synthesis catalysts
[DE94-018784] p 1236 N95-20349
Materials research for GHz multi-chip modules
[AD-A279661] p 1227 N95-20412
Spin-specific photoelectron diffraction using magnetic x ray circular dichroism
[DE94-017527] p 1567 N95-20448
Proceedings of the International Wire and Cable Symposium
[AD-A279242] p 1403 N95-20465
Growth, characterization and device development in monocrystalline diamond films
[AD-A285991] p 1568 N95-20614
Aerosol-assisted chemical vapor deposition of copper: A liquid delivery approach to metal thin films
[AD-A279702] p 1270 N95-20689
Copper metallization of stainless steels
[DE95-001496] p 1256 N95-21300
A multisite interaction expansion of the total energy in metals
[DE94-017175] p 1262 N95-22313

COPPER ALLOYS
Mixed-sputter deposition of Ni-Ti-Cu shape memory films
[DE94-017296] p 1250 N95-19900
Giant magnetoresistance calculated from first principles
[DE94-018658] p 1500 N95-20129
Method of making copper-titanium nitride alloy
[AD-D016582] p 1252 N95-20201
Characterization and electrical properties of copper films grown via direct liquid coinjection of (hfac)Cu(TMVS) and TMVS
[DE95-002957] p 1272 N95-20889
New thermodynamic description of the Cu-Zr system
[PB95-127189] p 1263 N95-22374

COPPER COMPOUNDS
Studies of the microwave resistivity of kappa-(BEDT-TTF)2Cu(N(CN)2)Cl
[DE95-002980] p 1262 N95-22291

COPPER FLUORIDES
New ET-based organic superconductors with the organometallic anion Cu(CF3)4(-)
[DE94-016904] p 1567 N95-20479

COPPER ISOTOPES
Helium production by 10 MeV neutrons in iron, nickel and copper
[DE94-014798] p 1529 N95-22280

COPPER OXIDES
Carrier doping and interlayer coupling in HTSC single crystals
[DE94-018637] p 1564 N95-20127
Neutron diffraction study of the magnetic ordering of BaCuO(2+x)
[DE95-001357] p 1572 N95-21297
Effects of neutron irradiation on the London penetration depth for polycrystalline Bi(1.8)Pb(0.3)Sr2Ca2Cu3O10 superconductor
[DE94-019335] p 1573 N95-21483
High temperature superconducting films and multilayers for electronics
[AD-A279545] p 1331 N95-21693
High performance YBCO films
[AD-A279560] p 1276 N95-21695
Magnetic interactions in the Emery model
[DE94-629059] p 1577 N95-22181
Local texture and strongly linked conduction in spray-pyrolyzed TlBa2Ca2Cu3O(8+x) deposits
[DE94-017887] p 1578 N95-22269

COPPER SELENIDES
Polycrystalline CuInSe2 and CdTe solar cells
[DE94-011875] p 1392 N95-20333
Novel thin-film CuInSe2 fabrication
[DE94-011874] p 1268 N95-20472
Processing and modeling issues for thin-film solar cell devices
[DE94-011895] p 1394 N95-21294
Non-H2Se, ultra-thin CuInSe2 devices
[DE94-011894] p 1395 N95-21844

CORE SAMPLING
Descriptions of WHOI sediment cores, volume 8
[AD-A279444] p 1436 N95-22073

CORN
A low energy continuous reactor separator for the production of ethanol from corn grits/starch and biomass streams
[DE95-002256] p 1283 N95-21356

CORNER FLOW
Effects of turbulence compressibility and unsteadiness in compression corner flow p 1344 N95-21052

CORONAL LOOPS
Coronal Mass Ejections in the solar wind at high solar latitudes: An overview
[DE95-000844] p 1603 N95-21377

CORONARY ARTERY DISEASE
The influence of coronary artery disease on +Gz tolerance: A preliminary study
[AD-A279305] p 1446 N95-21941

CORONAS
Solar wind composition
[NASA-TM-197364] p 1604 N95-22384

CORRELATION
Correlations between surface structure and catalytic activity/selectivity
[DE94-019023] p 1234 N95-20052
Long sequence correlation coprocessor
[AD-D016558] p 1313 N95-20280
Charmonium production, b quark and B meson production and b(bar b) correlations at CDF
[DE95-002525] p 1515 N95-20898
Analysis of subgrid models using direct and large-eddy simulations of isotropic turbulence p 1348 N95-21071
Luminosity polarization correlation in the SLC
[DE95-002889] p 1536 N95-21335
Correlations for the OH A(sup 2)(Sigma)(sup +)(v(prime)=0) electronic quenching cross-section
[DE95-002591] p 1244 N95-21524
The method of evaluating quantum partition function for the Hubbard model
[DE94-628991] p 1581 N95-21639
Science with High Spatial Resolution Far-Infrared Data
[NASA-CR-197353] p 1595 N95-21749
Two-dimensional maps of the infrared-to-radio ratio in spiral galaxies p 1593 N95-21765
Primitive Xe in the atmospheres of Earth and mars
p 1419 N95-21795

N=1 Superconformal minimal model correlation functions on the torus
[PB95-134615] p 1500 N95-21964
A new FHNC scheme for Gutzwiller correlated wave functions
[DE94-629037] p 1581 N95-21993
Single particle measurements and two particle interferometry results from CERN experiment NA44
[DE95-003041] p 1527 N95-22078
Microscopic theory of normal liquid He-3
[DE94-629047] p 1527 N95-22179

CORRELATORS
Optical pattern recognition
[AD-A285384] p 1480 N95-20607

CORRIDORS
Long Time Series Measurements in the Coastal Ocean: A workshop
[AD-A279509] p 1435 N95-21682

CORROSION
Chemical and electrochemical interactions on corroding metal surfaces
[DE95-000624] p 1250 N95-19979
FTIR spectroscopy for the determination of water in corrosive gases
[DE94-014658] p 1235 N95-20139
Corrosion of aircraft materials: Correlation between nanometer scale and macroscopic structural damage parameters
[AD-A285930] p 1252 N95-20299
Electrochemical impedance pattern recognition for detection of hidden chemical corrosion on aircraft components
[AD-A284998] p 1253 N95-20481
Electrochemical impedance pattern recognition for detection of hidden chemical corrosion on aircraft components
[AD-A285998] p 1239 N95-20716
VOC compliant wash primer
[AD-A286034] p 1273 N95-21000
Corrosion evaluation of fuel canister crusher rigging
[DE95-002962] p 1257 N95-21452
Aircraft corrosion study
[AD-A279527] p 1259 N95-21687
High temperature corrosion and crack growth of SiC/SiC at variable oxygen partial pressures
[DE94-018715] p 1232 N95-22115
Surface technology programme
[PB95-132866] p 1262 N95-22174
An update of corrosion inhibitors for mild steel exposed to 32-0-0 UAN solution
[DE95-001715] p 1263 N95-22396

CORROSION PREVENTION
Chemical and electrochemical interactions on corroding metal surfaces
[DE95-000624] p 1250 N95-19979
The Materials Corrosion and Environmental Effects Laboratory (MCEL)
[DE94-018268] p 1254 N95-20816
Epoxy lining for shipboard piping systems
[AD-A286228] p 1279 N95-22022
Demonstration of multifunctional DNBM corrosion inhibitors in protective coatings for Naval air/weapon systems
[AD-A285869] p 1279 N95-22136
An update of corrosion inhibitors for mild steel exposed to 32-0-0 UAN solution
[DE95-001715] p 1263 N95-22396

CORROSION RESISTANCE
Chemical and electrochemical interactions on corroding metal surfaces
[DE95-000624] p 1250 N95-19979
Hydrogen resistant alloy - NASA 23
[NASA-CASE-MFS-26200-1-SB] p 1251 N95-20068
Enhancement of corrosion resistance and mechanical properties of light-weight metals through the use of graded nonequilibrium microstructures
[AD-A286320] p 1251 N95-20178
Plasma arc melting of titanium-tantalum alloys
[DE94-016291] p 1252 N95-20331
Processing and applications of iron aluminides
[DE94-017855] p 1253 N95-20673
Feasibility study of power generation system with shape memory alloys
[DE95-714802] p 1254 N95-20890
Electrochemical impedance spectroscopy of trivalent chromium pre-treated aluminum alloy
[AD-A280093] p 1240 N95-20970
Nitrogen alloyed martensitic steels
[PB95-127791] p 1255 N95-21128
Polyurethane self-priming topcoats
[AD-D016204] p 1274 N95-21154
Polyurethane self-priming topcoats
[AD-D016205] p 1274 N95-21155
Joining dissimilar stainless steels for pressure vessel components
[PB95-133005] p 1380 N95-21446
Weldability of iron aluminides
[DE94-019114] p 1257 N95-21555
Corrosion resistance and behavior of construction materials exposed to dilute sulfuric acid at elevated temperatures under static conditions
[DE95-001723] p 1259 N95-21739
Corrosion resistance and behavioral characteristics of metals exposed to 70 percent by weight sulfuric acid at elevated temperatures
[DE95-001724] p 1259 N95-21740
Plasma arc melting of a 80 weight percent tantalum -20 weight percent titanium alloy
[DE95-000846] p 1260 N95-22006

CORROSION TESTS
An overview of the Evaluation of Oxygen Interactions with Materials 3 Experiment: Space Shuttle Mission 46; July-August, 1992
[NASA-TM-110129] p 1412 N95-20278
Corrosion resistance and behavior of construction materials exposed to dilute sulfuric acid at elevated temperatures under static conditions
[DE95-001723] p 1259 N95-21739
Corrosion resistance and behavioral characteristics of metals exposed to 70 percent by weight sulfuric acid at elevated temperatures
[DE95-001724] p 1259 N95-21740
Protective organic coatings on steel: Accelerated corrosion test method for paint/coatings exposed to water with low conductivity. Nordtest project no. 1010-92. Degradation of organic coatings in fresh water
[PB95-134185] p 1277 N95-21873
Corrosion behavior of landing gear steels
[AD-A285862] p 1261 N95-22132

COSMIC DUST
Azimuthally averaged radial S(sub 100 microns)/S(sub 60 microns) dust color temperatures in spiral galaxies
p 1593 N95-21760
Far-Infrared sources and diffuse emission in M31
p 1593 N95-21761
Far-infrared mapping of dusty elliptical galaxies
p 1593 N95-21763
A HIRES analysis of the FIR emission of supernova remnants p 1594 N95-21770

COSMIC PLASMA
The atmospheric neutrino anomaly in Soudan 2
[DE94-019288] p 1604 N95-21475

COSMIC RAY SHOWERS
Search for Centauro events in the DO Detector at Fermilab collider
[DE95-002522] p 1535 N95-21314

COSMIC RAYS
Solar-Geophysical Data number 600, August 1994. Part 2: (Comprehensive reports). Data for February 1994 and miscellaneous
[PB95-105060] p 1603 N95-20722
Search for Centauro events in the DO Detector at Fermilab collider
[DE95-002522] p 1535 N95-21314

COSMIC X RAYS
Solar-Geophysical Data number 600, August 1994. Part 1: (Prompt reports). Data for July, June 1994, and late data
[PB95-104923] p 1603 N95-20713

COSMOLOGY
Connection with dynamics: General introduction
[NASA-CR-197617] p 1579 N95-19947
Predictions from quantum cosmology
[PB95-111126] p 1599 N95-20173
Von Neumann algebra automorphisms and time-thermodynamics relation in general covariant quantum theories
[PB95-111084] p 1580 N95-20324
Cosmological string solutions by dimensional reduction
[DE95-002858] p 1599 N95-21245
The ORNL Neutron-Capture Cross Section Facility
[DE94-019146] p 1537 N95-21460
Surface exposure geochronology using cosmogenic nuclides: Applications in Antarctic glacial geology
[AD-A279392] p 1426 N95-21944

COST ANALYSIS
Progress in the development of recycling processes for electric vehicle batteries
[DE94-015894] p 1324 N95-20626
The personal aircraft: Status and issues
[NASA-TM-109174] p 1200 N95-20688
Readings in program control
[NASA-SP-6103] p 1583 N95-20739
Cost estimating methods for advanced space systems
p 1583 N95-20741
An analysis of cost overruns on defense acquisition contracts p 1584 N95-20749
The impact of partnering on construction contracts
[AD-A286588] p 1585 N95-20855
Performance and cost analysis of monolithic solid oxide fuel cells
[DE95-002511] p 1394 N95-20896
Technical and economic evaluation of natural gas based synthesis gas production technologies
[PB95-130597] p 1242 N95-21426
Power systems for future missions
[NASA-CR-195320] p 1222 N95-21531
Benefits of CMM-based software process improvement: Executive summary of initial results
[AD-A286444] p 1468 N95-21567
Cost-effective ceramics program in the United States
[DE95-001425] p 1278 N95-21909
Analysis of cost: Combustion flame CVD diamond deposition
[AD-A279153] p 1278 N95-21973
Technical cost modeling applied to CVD diamond deposition
[AD-A286119] p 1578 N95-22231

COST EFFECTIVENESS
Naval aviation: F-14 upgrades are not adequately justified. Report to Congressional Committees
[AD-A286338] p 1206 N95-20212
Performance specifications for technology development: Application for characterization of volatile organic compounds in the environment
[DE94-016627] p 1401 N95-20234
Assuring Known Good Die (KGD) for reliable, cost effective MCMs p 1210 N95-20644
Improving cost efficiency in large programs
p 1584 N95-20743
A strategy of cost control for Mariner Venus/Mercury 1973 p 1585 N95-20751
Highlights of recent balance of system research and evaluation
[DE95-001626] p 1393 N95-20863
Cost-effective ceramics program in the United States
[DE95-001425] p 1278 N95-21909
Economic feasibility analysis of distributed electric power generation based upon the natural gas-fired fuel cell
[DE94-012277] p 1396 N95-22033

COST ESTIMATES
Cost estimating methods for advanced space systems
p 1583 N95-20741
Estimating the costs of human space exploration
p 1584 N95-20744

COST REDUCTION
Multiply manifolded molten carbonate fuel cells
[DE94-017074] p 1392 N95-20480
Environmental cleanup technology transfer initiatives
[AD-A285059] p 1403 N95-20487
Reliability assessment of Multichip Module technologies via the Triservice/NASA RELTECH program
p 1210 N95-20643
NASA's attack on costs p 1585 N95-20755
Recent reflux receiver developments under the US DOE program
[DE95-001622] p 1393 N95-20861
The opportunities for and challenges of common integrated electronics
[AD-A279991] p 1327 N95-20966
Research on the promotion measures to introduce new energy and energy-saving technologies with a leasing system
[DE95-714801] p 1375 N95-22079

COSTS
Proceedings of the 13th Space Photovoltaic Research and Technology Conference (SPRAT 13)
[NASA-CP-3278] p 1316 N95-20502
The demise of plastic encapsulated microcircuit myths
p 1209 N95-20640
MCMs for avionics: Technology selection and intermodule interconnection p 1210 N95-20641
Advanced Standard Electronic Modules format-E (SEM-E) processes for rapid prototyping
p 1210 N95-20642
But what will it Cost? The history of NASA cost estimating p 1583 N95-20742
Improving cost efficiency in large programs
p 1584 N95-20743
The advantages of cost plus award fee contracts
p 1584 N95-20745
A Cost and Performance System (CAPS) in a Federal agency p 1584 N95-20746
Development of concentrator solar cells
[DE95-002316] p 1394 N95-20871
Minimax optimal stop rule in reliability checking
[PB95-134557] p 1383 N95-21961

COULOMB POTENTIAL
Structure of ionic interfaces from an absolutely convergent solution of the Madelung problem
[DE94-019268] p 1573 N95-21474

COUNTERMEASURES
Directive optimization of coherent sidelobe canceller systems
[AD-D016513] p 1307 N95-21908

COUNTERS
Uninterrupted, enhanced-rate event sequencer with mixed-speed counter modules
[AD-D016255] p 1334 N95-22030
COUNTING
FTIR spectroscopy for the determination of water in corrosive gases
[DE94-014658] p 1235 N95-20139
Counting methods for the analysis of load time histories
[PB95-132916] p 1388 N95-22093
COUNTING CIRCUITS
Uninterrupted, enhanced-rate event sequencer with mixed-speed counter modules
[AD-D016255] p 1334 N95-22030
Radiation tests on service electronics for future multi TeV detectors
[DE94-632822] p 1335 N95-22184
COUPLED MODES
Coupled tearing modes in plasmas with differential rotation
[DE94-631422] p 1548 N95-19977
Competition between electromagnetic modes in a free-electron maser
[AD-A279546] p 1374 N95-21694
Theory of spin dynamics in the classical two-dimensional heisenberg magnet
[PB95-133559] p 1502 N95-22138
Bunched beam instability with frequency spread
[DE94-018632] p 1539 N95-22357
COUPLING
A model for electron nuclear dynamics of a monatomic chain
[AD-A279652] p 1506 N95-19960
Active neutron multiplicity analysis and Monte Carlo calculations
[DE94-016178] p 1516 N95-21114
COUPLING CIRCUITS
Derivation of coupling impedance from the wake potential of a finite bunch
[DE95-002529] p 1532 N95-20421
Pre-amplifier with multi-stage feedback
[AD-D016254] p 1336 N95-22418
COUPLINGS
Unbinned maximum likelihood fit for the CP conserving couplings for W + photon production at CDF
[DE95-001471] p 1514 N95-20852
Anomalous vector-boson couplings in Majorana neutrino models
[PB95-127460] p 1518 N95-21220
COVARIANCE
Current status of fusion-relevant covariance data
[DE95-000865] p 1561 N95-22010
CRACK CLOSURE
Crack closure and sequential effects in fatigue: A literature survey
[PB95-131637] p 1387 N95-21557
Influence of fatigue crack closure on the growth rate of surface flaws
[AD-A279130] p 1387 N95-21967
CRACK INITIATION
The processing and mechanical properties of high temperature/high performance composites. Mechanism-based constitutive laws and design, book 1
[AD-A279736] p 1228 N95-20801
CRACK OPENING DISPLACEMENT
Finite element modelling of creep crack growth in 316 stainless and 9Cr-1Mo steels
[DE94-018977] p 1258 N95-21560
CRACK PROPAGATION
Analyses of some benchmark cases in fracture mechanics using boundary element method
[PB95-110888] p 1384 N95-19930
Properties of whisker-reinforced ceramics
[DE94-017759] p 1264 N95-20024
The processing and mechanical properties of high temperature/high performance composites. Fatigue and creep, book 3
[AD-A279738] p 1227 N95-20430
Flux-focusing eddy current probe and rotating probe method for flaw detection
[NASA-CASE-LAR-15231-1-SB] p 1383 N95-20764
Experimental investigation of wave and fracture phenomena in impacted ceramics
[AD-A286589] p 1272 N95-20856
Micromechanical approach to transformation toughening in ceramics
[PB95-135422] p 1273 N95-20976
Crack closure and sequential effects in fatigue: A literature survey
[PB95-131637] p 1387 N95-21557
Finite element modelling of creep crack growth in 316 stainless and 9Cr-1Mo steels
[DE94-018977] p 1258 N95-21560
The mechanical behavior of surface-modified ceramics
[DE95-001704] p 1276 N95-21572
The role of microcracking on the crack growth resistance of brittle solids and composites
[DE95-001678] p 1231 N95-21736
Influence of fatigue crack closure on the growth rate of surface flaws
[AD-A279130] p 1387 N95-21967
High temperature corrosion and crack growth of SiC/SiC at variable oxygen partial pressures
[DE94-018715] p 1232 N95-22115
Welding tritium exposed stainless steel
[DE95-003208] p 1382 N95-22356
Fracture behavior of laminated discontinuously reinforced aluminum material
[DE94-017307] p 1263 N95-22408
CRACKING (FRACTURING)
Analysis of the progressive failure of brittle matrix composites
[NASA-CR-195415] p 1225 N95-19951
The processing and mechanical properties of high temperature/high performance composites. Stress redistribution and notch properties, book 2
[AD-A279737] p 1227 N95-20429
The processing and mechanical properties of high temperature/high performance composites. Fatigue and creep, book 3
[AD-A279738] p 1227 N95-20430
Fracture analysis of an all-ceramic bearing system
[AD-A285056] p 1269 N95-20486
Virtual reality in precision engineering research
[AD-A286528] p 1465 N95-21012
Finite element modelling of creep crack growth in 316 stainless and 9Cr-1Mo steels
[DE94-018977] p 1258 N95-21560
Aluminium oxide targets after ballistic impact; fragmentation of the ceramic and the projectile
[PB95-133625] p 1388 N95-22097
Welding tritium exposed stainless steel
[DE95-003208] p 1382 N95-22356
CRACKS
Analyses of some benchmark cases in fracture mechanics using boundary element method
[PB95-110888] p 1384 N95-19930
Analysis of the progressive failure of brittle matrix composites
[NASA-CR-195415] p 1225 N95-19951
An overview of the HSST Full-Thickness Shallow-Crack Clad Beam Testing Program
[DE94-018940] p 1385 N95-20322
Microstructural contributions to the fracture resistance of silicon nitride ceramics
[DE94-018955] p 1267 N95-20323
Eddy current for detecting second-layer cracks under installed fasteners
[AD-A279871] p 1382 N95-20414
Damage tolerance of carbon fibre polyetheretherketone laminates
[PB95-131611] p 1230 N95-21432
Crack closure and sequential effects in fatigue: A literature survey
[PB95-131637] p 1387 N95-21557
A study of mechanical processing damage in brittle materials
[DE95-002126] p 1276 N95-21585
Influence of fatigue crack closure on the growth rate of surface flaws
[AD-A279130] p 1387 N95-21967
Damage tolerant repair techniques for pressurized aircraft fuselages
[AD-A286298] p 1199 N95-22046
CRASH LANDING
Commuter/air taxi ditchings and water-related impacts that occurred from 1979 to 1989
[AD-A285691] p 1202 N95-20275
CRASHES
Commuter airplane accident data analysis
[AD-A286315] p 1202 N95-20174
CRASHWORTHINESS
Commuter airplane accident data analysis
[AD-A286315] p 1202 N95-20174
Commuter/air taxi ditchings and water-related impacts that occurred from 1979 to 1989
[AD-A285691] p 1202 N95-20275
Helicopter crewseat cushion program
[AD-A286654] p 1452 N95-20973
CRATERS
Polar volatiles on Mercury and the Moon
p 1422 N95-21811
CRATONS
Volatiles in the Earth: All shallow and all recycled
p 1416 N95-21779
CRAY COMPUTERS
Implementation and performance of a three-dimensional numerical transport model
[PB95-135745] p 1402 N95-20440
Direct simulation and graphics post-processing of three-dimensional turbulent flows p 1352 N95-21098
Status of CFDLIB performance tests on the T3D
[DE95-002708] p 1478 N95-21925
CREATIVITY
Planning and scheduling for success
p 1584 N95-20747
CREEP ANALYSIS
Creep behavior in SiC whisker-reinforced alumina composite
[DE95-001071] p 1231 N95-21776
CREEP PROPERTIES
Enhancement of creep resistance of a sintered S3N4 ceramic by microwave annealing
[DE94-017698] p 1265 N95-20220
The processing and mechanical properties of high temperature/high performance composites. Stress redistribution and notch properties, book 2
[AD-A279737] p 1227 N95-20429
The processing and mechanical properties of high temperature/high performance composites. Fatigue and creep, book 3
[AD-A279738] p 1227 N95-20430
The reliability of laser reflowed Sn-Ag solder joints
[AD-A279787] p 1315 N95-20443
The processing and mechanical properties of high temperature/high performance composites. Processing/property correlations, book 4
[AD-A279739] p 1228 N95-20802
Finite element modelling of creep crack growth in 316 stainless and 9Cr-1Mo steels
[DE94-018977] p 1258 N95-21560
Mantle devolatilization and rheology in the framework of planetary evolution p 1418 N95-21788
The role of grain boundary sliding on creep deformation characteristics of discontinuous reinforced composites
[DE95-001671] p 1231 N95-21924
The processing and mechanical properties of high temperature/high performance composites. Book 6: Delamination and compressive behavior
[AD-A279780] p 1231 N95-21999
Irradiation creep in structural materials at ITER operating conditions
[DE94-018946] p 1261 N95-22123
Flux creep with logarithmic U(j) dependence
[DE94-629058] p 1577 N95-22180
CREEP RUPTURE STRENGTH
Effect of heat treatment temperature on creep-rupture properties of Fe3Al-based alloys
[DE94-017904] p 1253 N95-20375
Atom probe field ion microscopy of type 308 CRE stainless steel welds
[DE94-019162] p 1261 N95-22127
CREEP STRENGTH
Enhancement of creep resistance of a sintered S3N4 ceramic by microwave annealing
[DE94-017698] p 1265 N95-20220
Creep behavior in SiC whisker-reinforced alumina composite
[DE95-001071] p 1231 N95-21776
CREEP TESTS
Enhancement of creep resistance of a sintered S3N4 ceramic by microwave annealing
[DE94-017698] p 1265 N95-20220
CREW WORKSTATIONS
The advanced technology crew station: Development and validation of a workload assessment technique for cockpit function allocation
[AD-A279544] p 1453 N95-21691
Systems engineering design and technical analyses for Strategic Avionics Crew-station Design Evaluation Facility (SACDEF)
[AD-A286239] p 1213 N95-22024
CREWS
Navigation system in combat vehicle
[PB95-131629] p 1452 N95-21467
CRITERIA
Magnetoelectric properties of reciprocal bianisotropic materials with focus on the polarizability of chiro-omega spheres
[PB95-127650] p 1544 N95-21103
CRITICAL FLOW
New theory of critical flow velocities in superfluid helium
[PB95-130365] p 1571 N95-21228
Critical dynamics and plastic flow in disordered Josephson junction arrays
[DE94-629074] p 1576 N95-21995
CRITICAL PATH METHOD
Scheduling: A guide for program managers
p 1584 N95-20748
CRITICAL POINT
Dependence of critical current density on microstructure and processing of high-T(c) superconductors
[DE95-000685] p 1571 N95-21167

Effects of neutron irradiation on the London penetration depth for polycrystalline Bi(1.8)Pb(0.3)Sr2Ca2Cu3O10 superconductor
|DE94-019335| p 1573 N95-21483
An exact enumeration of self-avoiding loops on a square lattice
|DE94-628999| p 1578 N95-22276

CRITICAL VELOCITY
New theory of critical flow velocities in superfluid helium
|PB95-130365| p 1571 N95-21228

CROSS CORRELATION
Nonparametric estimation of the cyclic cross-spectrum
|AD-A285756| p 1498 N95-21219

CROSS FLOW
Liquid-metal pin-fin pressure drop by correlation in cross flow
|DE94-017086| p 1338 N95-19923
Numerical study of realistic perturbations in three-dimensional boundary layers p 1351 N95-21091
Computational studies of laminar to turbulence transition
|AD-A285622| p 1353 N95-21146

CROSS POLARIZATION
Large bistatic angle clutter depolarization study
p 1296 N95-20941

CROSS SECTIONS
Evidence for t(bar t) production at the Tevatron: Statistical significance and cross section
|DE95-002524| p 1515 N95-20897
Signals for top quark anomalous chromomagnetic moments at colliders
|DE95-002896| p 1535 N95-21254
Measurement of W and Z production cross-sections in p(bar p) collisions at (radical)s = 1.8 TeV
|DE95-002250| p 1523 N95-21521
Structure functions and structure function ratio F2(n)/F2(p) at low X(Bj) and Q2 in inelastic muon scattering
|DE94-018979| p 1573 N95-21561
Measurement of the B meson differential cross-sections in p(bar p) collisions at (radical)s = 1.8 TeV using the exclusive decays B(sup (+-)) (yields) J/(psi)K(sup (+-)) and B(sup 0) (yields) J/(psi)K*(sup 0)
|DE94-018993| p 1523 N95-21562
Measurement of the B cross section at CDF via B semileptonic decays
|DE95-002217| p 1524 N95-21597
Structure functions and structure function ratio F(sup n)2/F(sup p)2 at small x(sub Bj) and Q2 in muon-nucleon scattering
|DE94-017981| p 1530 N95-22340

CROSSINGS
Higher order crossings
|AD-A279597| p 1504 N95-20300
Accuracy problems in the generation of discrete time stochastic processes
|PB95-131397| p 1386 N95-21133

CROSSLINKING
The synthesis and characterization of small molecule and photo-cross-linkable high polymeric phosphazenes bearing cinnamate groups
|AD-A279782| p 1268 N95-20442
Cross-linking reactions for the conversion of polyphosphazenes into useful materials
|AD-A279696| p 1271 N95-20709
Control of continuous phase PH using visible light to activate PH-dependent fibers and gels in a controlled and reversible manner
|AD-D016532| p 1543 N95-20728

CRUDE OIL
Responsive copolymers for enhanced petroleum recovery
|DE94-018822| p 1267 N95-20350

CRUSHERS
Corrosion evaluation of fuel canister crusher rigging
|DE95-002962| p 1257 N95-21452

CRUSHING
Test fixture for determination of energy absorbing capabilities of composite materials
|NASA-CASE-LAR-15212-1-CU| p 1229 N95-21008

CRUSTS
Spatial variation of primordial 3-He in crustal fluids along the East-African Rift system (the Ethiopian and the Kenya Rift section) p 1418 N95-21789
Atmospheres of the Moon and Mercury
p 1419 N95-21794
Alkali element depletion by core formation and vaporization on the early Earth p 1421 N95-21804
The ratios of carbon and non-radiogenic helium and argon isotopes in the mantle and crustal rocks
p 1421 N95-21805
Subduction of hydrated basalt of the oceanic crust: Implications for recycling of water into the upper mantle and continental growth p 1423 N95-21814

CRYOGENIC COOLING
Space power facility readiness for Space Station power system testing
|NASA-TM-106829| p 1218 N95-21384
Thermal and deformation analyses of a novel cryogenically cooled monochromator for an Advanced Photon Source beamline
|DE94-016914| p 1527 N95-22190

CRYOGENIC FLUIDS
Cryogenic targets for inertial confinement fusion
|DE94-016200| p 1555 N95-21115

CRYOGENIC STORAGE
Space power facility readiness for Space Station power system testing
|NASA-TM-106829| p 1218 N95-21384

CRYOGENIC TEMPERATURE
On-wafer, cryogenic characterization of ultra-low noise HEMT devices p 1305 N95-21539

CRYOGENICS
Cryogenic targets for inertial confinement fusion
|DE94-016200| p 1555 N95-21115
Cryogenic pellet laser plasma source targets
|DE95-002488| p 1376 N95-22169

CRYOPUMPING
Helium exhaust studies in the D3-D tokamak
|DE94-016682| p 1552 N95-20334

CRYPTOGRAPHY
Semaphore network encryption report
|AD-A279294| p 1303 N95-21493

CRYSTAL DEFECTS
Strain fields in crystalline materials: Methods of analysis based on x-ray diffraction-line broadening
|PB95-108064| p 1574 N95-21670
Reciprocal space mapping of epitaxial materials using position-sensitive x-ray detection
|DE95-001620| p 1575 N95-21991

CRYSTAL DISLOCATIONS
Post-irradiation deformation characteristics of heavy-ion irradiated 304L SS
|DE94-017462| p 1251 N95-20088

CRYSTAL FIELD THEORY
Lattice results for heavy light matrix elements
|DE94-019101| p 1523 N95-21551

CRYSTAL GROWTH
Radiation effects on p+n InP junctions grown by MOCVD p 1319 N95-20520
Design of high-efficiency, radiation-hard, GaInP/GaAs solar cells p 1319 N95-20521
High contrast organic crystal optical modulator for phased array antenna and optical signal processing
|AD-A286557| p 1544 N95-20844
Characterization and electrical properties of copper films grown via direct liquid coinjection of (hfac)Cu(TMVS) and TMVS
|DE95-002957| p 1272 N95-20889
Dependence of critical current density on microstructure and processing of high-T(c) superconductors
|DE95-000685| p 1571 N95-21167
X-ray studies of microstructures in semiconductor and superconducting materials
|DE95-001802| p 1572 N95-21279
Raman spectra of MOCVD-grown ferroelectric PbTiO3 thin films
|DE94-018964| p 1244 N95-21549
Directional solidification of the alumina-zirconia ceramic eutectic system
|DE95-001677| p 1277 N95-21735
Growing and releasing diamonds
|AD-D016489| p 1577 N95-22103
An improved Monte Carlo algorithm for simulating grain growth
|DE94-017903| p 1578 N95-22272

CRYSTAL LATTICES
The dynamics of formation and evaporation of mixed alkali halide nanocrystals: A case of comparable lattice energies
|AD-A285052| p 1567 N95-20483
InGaAs PV device development for TPV power systems p 1322 N95-20537
Crystalline beams: The horizontal zigzag
|DE95-002227| p 1533 N95-20766
Lattice results for heavy light matrix elements
|DE94-019101| p 1523 N95-21551
Second order approximation for optical polaron in the strong coupling case
|DE94-628997| p 1525 N95-21856
The doping effect on spin-Peierls instability
|DE94-629046| p 1577 N95-22178
The Modified Embedded Atom Method
|DE94-017958| p 1248 N95-22273
An exact enumeration of self-avoiding loops on a square lattice
|DE94-628999| p 1578 N95-22276

CRYSTAL OPTICS
High contrast organic crystal optical modulator for phased array antenna and optical signal processing
|AD-A286557| p 1544 N95-20844
Light output and radiation damage in a YAlO3:Ce crystal
|DE94-016815| p 1545 N95-21643
Thermal and deformation analyses of a novel cryogenically cooled monochromator for an Advanced Photon Source beamline
|DE94-016914| p 1527 N95-22190

CRYSTAL OSCILLATORS
Generation of micro-domains in AT-cut quartz by thermal processing and the effect on resonator modes
|DE94-017344| p 1564 N95-20087

CRYSTAL STRUCTURE
Polycrystalline thin film cadmium telluride solar cells fabricated by electrodeposition
|DE94-011848| p 1391 N95-20118
Pairing on small clusters in the Peierls-Hubbard model: Implications for C60
|DE94-016284| p 1565 N95-20330
Changes in the behavior of magnetic materials undergoing processing in electrical rotating machines
|PB95-104493| p 1325 N95-20702
Crystalline beams
|DE95-002656| p 1569 N95-20793
Plastic deformation of ordered intermetallic alloys: Fundamental aspects
|DE95-001070| p 1256 N95-21265
Structure and stability of hydrous minerals at high pressure p 1417 N95-21786
Hydrogen and related materials at high density: Physics, chemistry and planetary implications
p 1418 N95-21791
Volatiles in the deep Earth: An experimental study using the laser-heated diamond cell p 1421 N95-21803
Reciprocal space mapping of epitaxial materials using position-sensitive x-ray detection
|DE95-001620| p 1575 N95-21991
Electrostatic basis for molecular recognition in photosynthesis
|DE95-002979| p 1440 N95-22075
Gravitational effects on the development of weld-pool and solidification microstructures
|DE94-017772| p 1285 N95-22261
Biaxiality of chiral liquid crystals
|DE94-629032| p 1578 N95-22277
Parallel nanometer scale fabrication
|DE95-002122| p 1336 N95-22284
Characterization of a texture gradient in tantalum plate
|DE95-002704| p 1262 N95-22289
Effect of annealing temperature on the texture of rolled tantalum and tantalum-10 wt % tungsten
|DE95-002702| p 1262 N95-22308
Introduction to the structures determination methods using X-ray diffraction in monocrystals: Application to some lanthanides and transition metals complexes with organic ligands
|DE94-629002| p 1579 N95-22380

CRYSTALLINITY
Matrix formulation of the particle motion in crystalline beams
|DE94-017301| p 1563 N95-19925
Crystalline beam in a storage ring: How long can it last?
|DE94-017303| p 1563 N95-20014
Orientation studies of polyolefins by IR-dichroism
|PB95-104386| p 1236 N95-20256
Morphology of highly textured E/EP diblock copolymers
|AD-A279813| p 1269 N95-20582
Aerosol-assisted chemical vapor deposition of copper: A liquid delivery approach to metal thin films
|AD-A279702| p 1270 N95-20689
Macromolecular and materials design using polyphosphazenes
|AD-A279781| p 1273 N95-20978
Raman spectra of MOCVD-grown ferroelectric PbTiO3 thin films
|DE94-018964| p 1244 N95-21549
Novel materials and devices from self-assembled periodic structures
|AD-A286499| p 1232 N95-22211

CRYSTALLITES
Strain fields in crystalline materials: Methods of analysis based on x-ray diffraction-line broadening
|PB95-108064| p 1574 N95-21670

CRYSTALLIZATION
Gas-phase generation of zinc sulfide particles using a single-source precursor
|AD-A279700| p 1239 N95-20712
Confinement and stability of crystalline beams in storage rings
|DE95-002515| p 1533 N95-20886

CRYSTALLOGRAPHY
Mean field analysis of orientation selective grain growth driven by interface-energy anisotropy
[DE94-015797] p 1566 N95-20399
New ET-based organic superconductors with the organometallic anion Cu(CF3)4(-)
[DE94-016904] p 1567 N95-20479
Synthesis and characterization of (Zn(SEt)Et)10, formed via insertion of sulfur into Zn-C bonds: A new class of Wurtzite-like cluster framework
[AD-A279701] p 1569 N95-20714
A crystallographic model for hydrous wadsleyite (Beta-Mg2SiO4) p 1424 N95-21817
Theses of the Proceedings of the 23d International Meeting on the Physics of Charged Particle Interaction with Crystals
[DE94-631501] p 1529 N95-22281
Synthesis and characterization of single-source molecular precursors to binary metal sulphides: Bis(diethyldithiocarbamato) M(2)trialkylphosphine (M = Zn and Cd) adducts
[AD-A279746] p 1248 N95-22385

CRYSTALS
Light output and radiation damage in a lead tungstate crystal
[DE94-016814] p 1565 N95-20265
Changes in the behavior of magnetic materials undergoing processing in electrical rotating machines
[PB95-104493] p 1325 N95-20702
Synthesis and characterization of (Zn(SEt)Et)10, formed via insertion of sulfur into Zn-C bonds: A new class of Wurtzite-like cluster framework
[AD-A279701] p 1569 N95-20714
Resonant photon-graviton conversion in EM fields: From earth to heaven
[DE95-002784] p 1301 N95-21241
Strain measurement by diffraction at LANSCE
[DE94-018264] p 1387 N95-21386
Application of new synchrotron powder diffraction techniques to anomalous scattering from glasses
[DE94-019285] p 1536 N95-21407
Diffraction applications using the energy dispersive beamline, X6A, at NSLS
[DE94-019287] p 1572 N95-21408
A crystallographic model for hydrous wadsleyite (Beta-Mg2SiO4) p 1424 N95-21817
Electrostatic basis for molecular recognition in photosynthesis
[DE95-002979] p 1440 N95-22075
Magnetic interactions in the Emery model
[DE94-629059] p 1577 N95-22181
Parallel nanometer scale fabrication
[DE95-002122] p 1336 N95-22284

CUBES (MATHEMATICS)
Almost kappa-wise independent random permutation of the cube
[PB95-108098] p 1495 N95-22147

CULTURE TECHNIQUES
Microbial degradation of polymers used in electronics
[AD-A286526] p 1273 N95-21011

CUMULONIMBUS CLOUDS
The initiation of lightning and the growth of electric fields in thunderstorms
[AD-A280033] p 1428 N95-20008

CUMULUS CLOUDS
Boundary layer cloud studies in support of ASTEX
[AD-A285947] p 1429 N95-20395

CURRENT DENSITY
Transport and dynamics in toroidal fusion systems
[DE94-018653] p 1548 N95-20029
A method for measuring the inductive electric field profile and noninductive current profiles on D3-D
[DE94-016683] p 1551 N95-20279
Recent results from Fast Wave Current Drive experiments on DIII-D
[DE94-016718] p 1551 N95-20285
Impedance characteristics of multistage ion diodes
[DE94-018887] p 1565 N95-20340
Electron-irradiated two-terminal, monolithic InP/Ga0.47In0.53As tandem solar cells and annealing of radiation damage p 1319 N95-20519
Field-emitter arrays for RF vacuum microelectronics
[AD-A279959] p 1325 N95-20661
Dependence of critical current density on microstructure and processing of high-T(c) superconductors
[DE95-000685] p 1571 N95-21167
Effects of neutron irradiation on the London penetration depth for polycrystalline Bi(1.8)Pb(0.3)Sr2Ca2Cu3O10 superconductor
[DE94-019335] p 1573 N95-21483
Cell membrane potentials induced during exposure to EMP fields
[DE94-018952] p 1439 N95-21548
Overview of the field and temperature dependence of J(c) in Ag/BSCCO tapes
[PB95-110318] p 1574 N95-21636
RF vacuum microelectronics based on thin film edge-emitter technology
[AD-A279539] p 1331 N95-21690
How to improve J(c(T)) in Ag/(BiPb)2Sr2Ca2Cu3O10 tapes
[PB95-110326] p 1575 N95-21949
Development of practical high temperature superconducting wire for electric power applications
[DE94-017894] p 1336 N95-22271
Effect of cell size on elliptically polarized radar clutter statistics
[AD-A285789] p 1311 N95-22401

CURRENT DISTRIBUTION
Parasitic current collection by solar arrays in LEO
p 1321 N95-20527
Field-emitter arrays for RF vacuum microelectronics
[AD-A279959] p 1325 N95-20661
Fiber-optic control of current filaments in high gain photoconductive semiconductor switches
[DE94-015804] p 1328 N95-21139
Equivalent source current formulation in impedance tomography
[PB95-127627] p 1329 N95-21326
Current distribution in Cable-In-Conduit Conductors
[DE95-001820] p 1332 N95-21725

CURRENTS
High frequency current sensors using the Faraday effect in optical fibers
[DE95-001859] p 1545 N95-21728

CURVATURE
Large-eddy simulation of a boundary layer with concave streamwise curvature p 1360 N95-22450

CURVE FITTING
Uncertainty estimates for derivatives and intercepts
[DE94-018492] p 1489 N95-20222
Fitting stochastic partial differential equations to spatial data
[AD-A279870] p 1490 N95-20432

CUSHIONS
Helicopter crewseat cushion program
[AD-A286654] p 1452 N95-20973

CV-880 AIRCRAFT
Fuselage burnthrough from large exterior fuel fires
[AD-A286295] p 1203 N95-22318

CYANATES
Ferrocyanide safety project Dynamic X-Ray Diffraction studies of sodium nickel ferrocyanide reactions with equimolar nitrate/nitrite salts
[DE94-017396] p 1236 N95-20268
Thermo-mechanical fatigue of polymer matrix composites
[AD-A285931] p 1267 N95-20390

CYANO COMPOUNDS
The organic chemistry of conducting polymers
[DE94-018216] p 1270 N95-20680

CYCLES
High speed optical storage technology
[AD-A285788] p 1456 N95-22400

CYCLIC COMPOUNDS
The synthesis and characterization of small molecule and photo-cross-linkable high polymeric phosphazenes bearing cinnamate groups
[AD-A279782] p 1268 N95-20442
Hydrogenation of nitriles on a well-characterized nickel surface: From surface science studies to liquid phase catalytic activity measurements
[DE94-018184] p 1259 N95-21707

CYCLIC HYDROCARBONS
Direct aromatization of methane
[DE94-017131] p 1233 N95-19924
Use of quantum chemically derived descriptors for QSAR modeling of reductive dehalogenation of aromatic compounds
[PB95-132783] p 1224 N95-22333

CYCLIC LOADS
The processing and mechanical properties of high temperature/high performance composites. Fatigue and creep, book 3
[AD-A279738] p 1227 N95-20430
Structural performance of cylindrical pressure housings of different ceramic compositions under external pressure loading. Part 1: Isostatically pressed alumina ceramic
[AD-A279669] p 1270 N95-20603
Microstructural design for tough ceramics
[AD-A285634] p 1273 N95-21152
Effects of cyclic stress distribution models on fatigue life predictions
[DE95-001619] p 1388 N95-22070

CYCLOTRON RADIATION
Recent results from Fast Wave Current Drive experiments on DIII-D
[DE94-016718] p 1551 N95-20285
MTX final report
[DE95-002960] p 1559 N95-21451

CYCLOTRON RESONANCE
Electrospray ionization Fourier transform ion cyclotron resonance mass spectrometric study of singly and doubly charged organometallic complexes
[AD-A279899] p 1238 N95-20563
Ion heating perpendicular to the magnetic field
[AD-A286635] p 1501 N95-20773
An advanced ECR ion source with a large uniformly distributed ECR plasma volume for multiply charged ion beam generation
[DE95-001078] p 1515 N95-20911
High magnetic field glow discharge ionization source
[AD-A279972] p 1241 N95-21123
1994 Nonneutral Plasma Workshop
[AD-A285656] p 1559 N95-21404
MTX final report
[DE95-002960] p 1559 N95-21451
Plasma-induced-damage of GaAs during etching of refractory metal contacts
[DE95-001525] p 1259 N95-21838
Temperature dependence of magnetopolarons in a parabolic quantum dot in arbitrary magnetic fields
[DE94-629033] p 1526 N95-22216

CYCLOTRON RESONANCE DEVICES
Competition between electromagnetic modes in a free-electron maser
[AD-A279546] p 1374 N95-21694

CYCLOTRONS
Temperature dependence of a magnetopolaron in a harmonic quantum dot in resonant magnetic fields
[DE94-629036] p 1502 N95-22177

CYLINDRICAL BODIES
Multi-layered translated rib-stiffened composite hollow cylinder assembly
[AD-D016566] p 1226 N95-20292
Dynamic measurement of the hoop modulus of a composite cylinder
[DE94-018958] p 1385 N95-20416
Attachment methodology for composite cylinder assembly
[AD-D016578] p 1227 N95-20459
Structural performance of cylindrical pressure housings of different ceramic compositions under external pressure loading. Part 1: Isostatically pressed alumina ceramic
[AD-A279669] p 1270 N95-20603
Broadband pressure barrier for circular waveguide
[AD-D016503] p 1306 N95-21672
Attachment methodology for composite cylinder assembly
[AD-D016256] p 1381 N95-22034
Structural performance of cylindrical pressure housings of different ceramic compositions under external pressure loading. Part 3: Sintered reaction bonded silicon nitride ceramic
[AD-A285773] p 1388 N95-22411

CYLINDRICAL PLASMAS
Coupled tearing modes in plasmas with differential rotation
[DE94-631422] p 1548 N95-19977

CYLINDRICAL SHELLS
Influence of primary boundary conditions on the buckling of shallow cylindrical shells
[PB94-208352] p 1384 N95-20003
A model of an infinite length, axisymmetric, isotropic, forced thick shell
[AD-A285586] p 1386 N95-21212

CYTOCHROMES
Calculation of atom-centered partial charges for heme
[DE94-014447] p 1520 N95-21375
Electrostatic basis for molecular recognition in photosynthesis
[DE95-002979] p 1440 N95-22075
Separation of proteins by convective electrophoresis through a porous membrane
[PB95-127130] p 1248 N95-22373

CYTOMETRY
Life Sciences Division and Center for Human Genome Studies
[DE94-017796] p 1440 N95-22065
Flow cytometry: A powerful technology for measuring biomarkers
[DE94-018284] p 1440 N95-22296

D

DAMAGE
Investigation of laser-induced retinal damage: Wavelength and pulsewidth dependent mechanisms
[AD-A286066] p 1443 N95-20848
A study of mechanical processing damage in brittle materials
[DE95-002126] p 1276 N95-21585
Laser materials processing at Sandia National Laboratories
[DE95-002183] p 1374 N95-21594

Defect geometries and laser-induced damage in multilayer coatings
[DE94-017695] p 1377 N95-22343

DAMAGE ASSESSMENT

Post-flight investigation programmes of recently retrieved solar generators p 1321 N95-20531

Significance of impact velocity for the extent of damage in carbon/epoxy laminates
[PB95-133484] p 1230 N95-21417

Definition report on target and related steering variables of radiation as a part of the environmental balance and environmental outlook investigation
[PB95-135471] p 1409 N95-21846

DAMKOHLER NUMBER

Lewis number and Damkohler number effects in vortex-flame interactions p 1249 N95-22439

DAMPING

Polyurethane-epoxy interpenetrating polymer network acoustic damping material
[AD-D016567] p 1266 N95-20293

Polyurethane-acrylic interpenetrating polymer network acoustic damping material
[AD-D016572] p 1266 N95-20294

Electromagnetic waves in an ultrarelativistically hot and strongly magnetized electron-positron plasma
[DE94-628963] p 1307 N95-21849

Proposed emittance upgrade for the SLC damping rings
[DE95-002887] p 1538 N95-22155

Acoustic and vibration attenuation composite material
[AD-D016585] p 1233 N95-22467

DARKENING

Factors affecting the perception of luning in monocular regions of partial binocular overlap displays
[AD-A286287] p 1547 N95-22044

DATA ACQUISITION

Wavelet-based acoustic recognition of aircraft
[DE94-017701] p 1503 N95-20019

The effects of three-dimensional graphs on decision making
[AD-A285034] p 1583 N95-20051

Target area acquisition and control system survivability for the National Ignition Facility
[DE94-016549] p 1550 N95-20190

Evolution of ground line of sight data field collection techniques
[AD-A285062] p 1204 N95-20497

A portable and independent edge fluctuation diagnostic
[DE94-018254] p 1554 N95-20681

Meso-scale cooling effects of high albedo surfaces: Analysis of meteorological data from White Sands National Monument and White Sands Missile Range
[DE94-018535] p 1429 N95-20782

Software Capability Evaluation (SCE), version 2.0 team members guide
[AD-A286082] p 1462 N95-20809

Airborne Multisensor Pod System (AMPS) data access concept
[DE95-002586] p 1389 N95-20903

Real-time dynamic simulator for the Topaz II reactor power system
[DE95-001604] p 1535 N95-21278

Overview of data fusion work for land electronic warfare
[AD-A279829] p 1301 N95-21292

Monitoring the response of the upper troposphere/lower stratosphere to a greenhouse gas scenario
[DE95-000982] p 1406 N95-21410

The Telecommunications and Data Acquisition Report
[NASA-CR-197390] p 1303 N95-21532

A proposed wind measurement and analysis approach for evaluating a prospective wind plant site
[DE94-019187] p 1395 N95-21611

Materials compatibility and lubricants research on CFC-refrigerant substitutes
[DE94-018414] p 1287 N95-21631

Implementation of electronic chain-of-custody, analysis requests, and data verification at Los Alamos National Laboratory
[DE94-018076] p 1407 N95-21666

CAiSE 1994 Doctoral Consortium
[PB95-135182] p 1469 N95-21711

Variability of total electron content in the high-altitude ionosphere following solar maximum
[AD-A285849] p 1425 N95-21833

Information security for unmanned systems
[AD-A286511] p 1485 N95-22214

DATA BASE MANAGEMENT SYSTEMS

New method for integrity constraint checking in deductive databases
[PB95-110672] p 1586 N95-19904

Calculation methods for criteria air pollutant emission inventories
[AD-A284675] p 1400 N95-19964

Downsizing information systems: Framing the issues for the Office of Naval Intelligence (ONI)
[AD-A279888] p 1588 N95-20589

Determining information management needs for enhanced international safeguards
[DE94-015787] p 1588 N95-20789

Airborne Multisensor Pod System (AMPS) data access concept
[DE95-002586] p 1389 N95-20903

Assessment of database for interaction of tritium with ITER plasma facing materials
[DE95-002038] p 1558 N95-21290

DBASE 4 basics
[DE94-016323] p 1469 N95-21713

Conference proceedings. Defense Modeling and Simulation Office Information/Data Base (I/DB) Task Group Meetings, and notes from the previous two I/DB meetings
[AD-A279097] p 1591 N95-22069

Taking AIM: The management of scientific and technical information at Argonne National Laboratory
[DE94-019279] p 1591 N95-22092

Guidelines for the creation and management of geographic data bases within a GIS environment, version 1.0. Volume 2. Appendices
[DE94-019215] p 1591 N95-22129

Using geographical data browsers in a networked environment
[DE94-017809] p 1592 N95-22263

University library document circulation system specified in LCM
[PB95-127957] p 1592 N95-22331

Experimental evaluation of dynamic data allocation strategies in a distributed database with changing workloads
[NASA-CR-195024] p 1456 N95-22431

DATA BASES

A database for analyzing sequential behavioral data and their associated cognitive models
[AD-A280061] p 1448 N95-19887

New method for integrity constraint checking in deductive databases
[PB95-110672] p 1586 N95-19904

The design and implementation of the functional/daplex data interface for the multimodel and multilingual database system
[AD-A280131] p 1587 N95-20039

Guidelines for the creation and management of geographic data bases within a GIS environment, version 1.0
[DE94-019214] p 1458 N95-20073

The Modified Embedded Atom Method
[DE94-015746] p 1564 N95-20142

Parallel solid mechanics codes at Sandia National Laboratories
[DE94-015770] p 1474 N95-20152

A Hyperspectral Image Data Exploration Workbench for environmental science applications
[DE94-016373] p 1412 N95-20171

Description and flow characterization of hypersonic facilities
[AD-A284291] p 1200 N95-20248

Relational databases for RHIC design and control
[DE94-016785] p 1532 N95-20336

High performance computing for materials process modeling
[DE94-017860] p 1460 N95-20358

Evolution of ground line of sight data field collection techniques
[AD-A285062] p 1204 N95-20497

The mechanical property data base from an Air Force/Industry cooperative test program on advanced aluminum alloys
[AD-A280038] p 1386 N95-20615

Translation of the data flow query language for the multimodel, multibackend database system
[AD-A285978] p 1588 N95-20617

Shaping the library of the future: Digital library developments at Los Alamos National Laboratory's Research Library
[DE95-001008] p 1588 N95-20777

The Energy Science and Technology Database on a local library system: A case study at the Los Alamos National Research Library
[DE95-001009] p 1589 N95-20818

Proceedings of the Cloud Impacts on DOD Operations and Systems 1993 Conference (CIDOS 1993)
[AD-A286658] p 1430 N95-20974

Use of operations research techniques in deductive databases
[PB95-135349] p 1589 N95-21004

GOLD: A Graph Oriented Language for Databases
[PB95-127544] p 1465 N95-21021

Studying Turbulence Using Numerical Simulation Databases. 5: Proceedings of the 1994 Summer Program
[NASA-CR-197362] p 1341 N95-21035

The coupling between flame surface dynamics and species mass conservation in premixed turbulent combustion p 1249 N95-21041

Direct simulation of turbulent flow in a square duct: Reynolds-stress budgets p 1348 N95-21073

FIREDOC users manual, 3rd edition
[PB95-128674] p 1286 N95-21129

Application of neural networks to seismic signal discrimination research findings
[AD-A285848] p 1415 N95-21308

Data link terminal DLT document
[PB95-110805] p 1205 N95-21369

A Hypervelocity Experimental Research Database (HERD): Support for the Wright Laboratory Armament Directorate Code Validation Program (COVAL)
[DE95-001628] p 1387 N95-21396

GRONICs-1994. Proceedings of the 1994 Groningen Student Conference on Computer Science
[PB95-135620] p 1468 N95-21455

Independent review of Aviation Technology and Research Information Analysis System (ATRIAS) database
[AD-A284049] p 1203 N95-21518

Implementation of electronic chain-of-custody, analysis requests, and data verification at Los Alamos National Laboratory
[DE94-018076] p 1407 N95-21666

Proceedings of the 5th Workshop on the Next Generation of CASE Tools
[PB95-135208] p 1469 N95-21716

A user's guide to LUGSAN 1.1: A computer program to calculate and archive lug and sway brace loads for aircraft-carried stores
[DE95-001919] p 1207 N95-21730

Thermochemistry of dense hydrous magnesium silicates p 1416 N95-21782

Variability of total electron content in the high-altitude ionosphere following solar maximum
[AD-A285849] p 1425 N95-21833

Current status of fusion-relevant covariance data
[DE95-000865] p 1561 N95-22010

Digital mapping, charting, and geodesy analysis program technical review of Vector Smart Map (VMap) level 1
[AD-A286294] p 1390 N95-22055

NODDS/WOSM interface user's manual
[AD-A279095] p 1471 N95-22068

Guidelines for the creation and management of geographic data bases within a GIS environment, version 1.0. Volume 2. Appendices
[DE94-019215] p 1591 N95-22129

Defense Data Repository System (DDRS). End user manual
[AD-A286484] p 1592 N95-22293

A conceptual approach to object-oriented data modeling
[AD-A286048] p 1592 N95-22416

Experimental evaluation of dynamic data allocation strategies in a distributed database with changing workloads
[NASA-CR-195024] p 1456 N95-22431

Databases post-processing in Tensoral
p 1363 N95-22465

DATA COMPRESSION

Digital filtering for data compression in telemetry systems
[DE94-016611] p 1219 N95-20567

Combining image-processing and image compression schemes p 1304 N95-21537

Image and video coding using a wavelet decomposition
[PB95-135067] p 1311 N95-22358

Spatio-temporal masking in human vision and its application to image coding
[AD-A284949] p 1451 N95-22473

DATA CONVERSION ROUTINES

BASIC program for power spectrum estimation
[DE95-002228] p 1468 N95-21515

DATA CORRELATION

Hires and beyond p 1592 N95-21750

An assessment of image reconstruction from balloon-borne and the IRAS data p 1592 N95-21752

DATA FLOW ANALYSIS

ILIAS: A sequential language for parallel matrix computations
[PB95-110631] p 1473 N95-20056

Time domain spectral hole-burning storage
[AD-A279912] p 1587 N95-20309

Environment for Test and Analysis of Distributed Software (ETADS)
[AD-A285776] p 1463 N95-20877

Functional and para-functional parallel processing
[DE95-002805] p 1475 N95-20888

Verification of a timestamp-based sliding-window protocol
[PB95-132759] p 1455 N95-22082
Data sampling for a burst mode communications system
[AD-A286098] p 1309 N95-22229
ActorStudio reference manual. A user's guide to the ActorStudio user interface editor, version 1.0
[PB95-127023] p 1472 N95-22310

DATA LINKS
GPS-Squitter capacity analysis
[AD-A280037] p 1291 N95-20599
Advanced Command and Control (C2) applications interfaces to the Advanced Communications Technology Satellite (ACTS)
[AD-A279676] p 1291 N95-20605
Data link terminal DLT document
[PB95-110805] p 1205 N95-21369
Design and modelling of a link monitoring mechanism for the Common Data Link (CDL)
[AD-A286167] p 1309 N95-22245

DATA MANAGEMENT
Guidelines for the creation and management of geographic data bases within a GIS environment, version 1.0
[DE94-019214] p 1458 N95-20073
A Hyperspectral Image Data Exploration Workbench for environmental science applications
[DE94-016373] p 1412 N95-20171
Relational databases for RHIC design and control
[DE94-016785] p 1532 N95-20336
Defense Data Repository System (DDRS). End user manual
[AD-A286484] p 1592 N95-22293
Databases post-processing in Tensoral
p 1363 N95-22465

DATA PROCESSING
Efficient caption-based retrieval of multimedia information
[AD-A279604] p 1586 N95-19956
Data analysis and visualization in MCNP (trademark)
[DE94-016164] p 1508 N95-20159
SAR image registration in absolute coordinates using GPS carrier phase position and velocity information
[DE94-018738] p 1204 N95-20195
Error analysis in wind turbine field testing
[DE94-011864] p 1391 N95-20260
The GPS Burst Detector W-Sensor
[DE94-017406] p 1204 N95-20269
Choice of computer software for analysis of spectra from the Multi-Spectral Logging System
[DE94-019013] p 1460 N95-20351
Kernel mucking in top
[DE94-017077] p 1460 N95-20385
Muon data analysis program RUMDA
[PB95-129839] p 1511 N95-20434
Search for D(+) yields (pi)(+)(mu)(+)(mu)(-)
[DE94-015538] p 1512 N95-20475
Model formality in human/computer collaboration
[AD-A286001] p 1462 N95-20718
Meso-scale cooling effects of high albedo surfaces: Analysis of meteorological data from White Sands National Monument and White Sands Missile Range
[DE94-018535] p 1429 N95-20782
Computer based analysis and synthesis of retinal function
[AD-A286084] p 1443 N95-20811
Enhancements in the Livermore spectrum analysis package PIXEF
[DE95-002487] p 1272 N95-20895
Airborne Multisensor Pod System (AMPS) data access concept
[DE95-002586] p 1389 N95-20903
Statistical properties of geologic fractals
[DE94-019272] p 1414 N95-20908
Development of a fast sampling system for estimation of impulse responses of mobile radio channels
p 1296 N95-20943
Superresolution direction finding algorithms for the characterisation of multi-moded HF signals
p 1299 N95-20958
Overview of data fusion work for land electronic warfare
[AD-A279829] p 1301 N95-21292
Support to the development of high-level graphics software
[PB95-131686] p 1466 N95-21349
Second International Conference on Ordinal Data Analysis
[AD-A279756] p 1590 N95-21401
Orbit determination of highly elliptical Earth orbiters using improved Doppler data-processing modes
p 1218 N95-21533
A proposed wind measurement and analysis approach for evaluating a prospective wind plant site
[DE94-019187] p 1395 N95-21611
Reentry vehicle on-site inspection technology study
[AD-A285960] p 1220 N95-21634
Implementation of electronic chain-of-custody, analysis requests, and data verification at Los Alamos National Laboratory
[DE94-018076] p 1407 N95-21666
CTD calibration and processing methods used at Woods Hole Oceanographic Institution
[AD-A279507] p 1435 N95-21681
MARI mini-manual
[PB95-134649] p 1526 N95-21965
Optical processing and control
[AD-A279157] p 1546 N95-21975
State of the art in CFD pre- and postprocessing
[PB95-110391] p 1356 N95-22017
DOD science and engineering apprenticeship program for high school students
[AD-A280371] p 1583 N95-22100
An IBM based ARINC interface
[ARL-TR-21] p 1471 N95-22104
Interpretation of HRTEM images by image simulation: An introduction to theory and practice
[DE95-003422] p 1591 N95-22235
Confirmatory analysis of SAGE-1, and -2 data
[DE95-003623] p 1427 N95-22240

DATA PROCESSING EQUIPMENT
The impact of advanced packaging technology on modular avionics architectures p 1208 N95-20632

DATA PROCESSING TERMINALS
Space constancy on video display terminals
[AD-A280015] p 1449 N95-20314
Evaluation of the Haworth-Newman avionics Display Readability Scale
[AD-A286127] p 1214 N95-22232

DATA RECORDERS
Investigation of flight data recorder fire test requirements
[AD-A285832] p 1208 N95-20032

DATA REDUCTION
SAR image registration in absolute coordinates using GPS carrier phase position and velocity information
[DE94-018738] p 1204 N95-20195
Uncertainty estimates for derivatives and intercepts
[DE94-018492] p 1489 N95-20222
Fitting stochastic partial differential equations to spatial data
[AD-A279870] p 1490 N95-20432
Enhancements in the Livermore spectrum analysis package PIXEF
[DE95-002487] p 1272 N95-20895
Airborne Multisensor Pod System (AMPS) data access concept
[DE95-002586] p 1389 N95-20903
Statistical properties of geologic fractals
[DE94-019272] p 1414 N95-20908
Laser anemometry and viscous computation of the flow through an annular turbine cascade
[AD-A280070] p 1341 N95-20968
Project Whitefeather
[DE94-016575] p 1415 N95-21184
Twentysixth YERAC
[PB95-127437] p 1599 N95-21347
SSME HPOTP post-test diagnostic system enhancement project
[NASA-CR-4643] p 1222 N95-21458
The ORNL Neutron-Capture Cross Section Facility
[DE94-019146] p 1537 N95-21460
Search for the top quark using multivariate analysis techniques
[DE95-000561] p 1522 N95-21498
Implementation of electronic chain-of-custody, analysis requests, and data verification at Los Alamos National Laboratory
[DE94-018076] p 1407 N95-21666
Numerical investigation of one-dimensional heat-flux calculations
[AD-A286293] p 1582 N95-22054

DATA RETRIEVAL
SCSI controller with target status retrieval
[AD-D016249] p 1476 N95-21504
Method of retrieving and storing computer peripheral data
[AD-D016251] p 1591 N95-22098

DATA SAMPLING
Data sampling for a burst mode communications system
[AD-A286098] p 1309 N95-22229

DATA STORAGE
Time domain spectral hole-burning storage
[AD-A279912] p 1587 N95-20309
Review of GIS applications in hydrologic modeling
[AD-A279076] p 1390 N95-21628
Common mapping system media study
[AD-A279086] p 1390 N95-21912
Standard data formats for simulation
[PB95-110367] p 1470 N95-22016
Taking AIM: The management of scientific and technical information at Argonne National Laboratory
[DE94-019279] p 1591 N95-22092
Method of retrieving and storing computer peripheral data
[AD-D016251] p 1591 N95-22098

DATA STRUCTURES
A multivariate multisample rank test for stochastic simulation validation
[AD-A285922] p 1498 N95-19990
Guidelines for the creation and management of geographic data bases within a GIS environment, version 1.0
[DE94-019214] p 1458 N95-20073
Computing methods for the approximate solution of time dependent problems
[AD-A286007] p 1491 N95-20719
Distribution-independent hierarchical N-body methods
[DE95-001686] p 1493 N95-21439
Standard data formats for simulation
[PB95-110367] p 1470 N95-22016

DATA SYSTEMS
Circuit means for providing compatibility between two separate digital data interfaces
[AD-D016225] p 1455 N95-21116
Programmable modular network interface
[AD-D016505] p 1477 N95-21674
Information Management Architecture for an Integrated Computing Environment for the Environmental Restoration Program. Volume 1: Introduction
[DE95-001384] p 1590 N95-21862
Information Management Architecture for an Integrated Computing Environment for the Environmental Restoration Program. Volume 2: Interim business systems guidance
[DE95-001385] p 1591 N95-22061
NODDS/WOSM interface user's manual
[AD-A279095] p 1471 N95-22068
Conference proceedings. Defense Modeling and Simulation Office Information/Data Base (I/DB) Task Group Meetings, and notes from the previous two I/DB meetings
[AD-A279097] p 1591 N95-22069

DATA TRANSFER (COMPUTERS)
A scalable video rate camera interface
[AD-A286144] p 1474 N95-20325
Non-intrusive SCSI status sensing system
[AD-D016242] p 1476 N95-21307
Network file server with automatic sensing means
[AD-D016250] p 1476 N95-21496
A simulation study of TCP performance in ATM networks
[DE94-016622] p 1477 N95-21505
DONIO: Distributed object network I/O library
[DE94-019163] p 1477 N95-21602
Verification of a timestamp-based sliding-window protocol
[PB95-132759] p 1455 N95-22082
Overview of rapid prototyping technologies in manufacturing
[PB95-127122] p 1472 N95-22372
TDX: A high-bandwidth crossbar-switched communication paradigm
[DE94-017187] p 1311 N95-22407

DATA TRANSMISSION
Proceedings of the International Wire and Cable Symposium
[AD-A279242] p 1403 N95-20465
A technique for increasing the bandwidth of high performance electrical backplanes p 1212 N95-20651
Electromagnetic compatibility effects of advanced packaging configurations p 1213 N95-20658
Innovative use of DSP technology in space: FORTE event classifier
[DE94-016086] p 1291 N95-20697
An object-oriented implementation of the Xpress transfor protocol
[DE95-001506] p 1301 N95-21277
PVM 3 beyond network computing
[DE94-019115] p 1477 N95-21556
The message passing version of the parallel Community Climate Model
[DE94-019158] p 1407 N95-21608
Application-oriented architecture for multimedia teleservices
[PB95-135513] p 1306 N95-21623
Data sampling for a burst mode communications system
[AD-A286098] p 1309 N95-22229
TDX: A high-bandwidth crossbar-switched communication paradigm
[DE94-017187] p 1311 N95-22407

DC 8 AIRCRAFT
Fuselage burnthrough from large exterior fuel fires
[AD-A286295] p 1203 N95-22318

DEACTIVATION

Recommendation on transition from primary/secondary radar to secondary-only radar capability
[AD-A286279] p 1308 N95-22005

DEBONDING (MATERIALS)

The processing and mechanical properties of high temperature/high performance composites. Book 6: Delamination and compressive behavior
[AD-A279780] p 1231 N95-21999

Embedded optical fibres as strain sensors in polymer matrix fibre composites: The influence of adhesion in strain transfer
[PB95-133617] p 1547 N95-22140

DECARBOXYLATION

Hydrothermal conversion of carbohydrates and related compounds
[PB95-134011] p 1396 N95-22175

DECAY RATES

Measurement of the polarization in the decay B(sup 0) (yields) J/(psi)K*(sup 0) in (bar p)p collisions at (radical)s = 1.8 TeV
[DE95-002521] p 1520 N95-21313

Theory of spin dynamics in the classical two-dimensional heisenberg magnet
[PB95-133559] p 1502 N95-22138

DECISION MAKING

The effects of three-dimensional graphs on decision making
[AD-A285034] p 1583 N95-20051

Development and enhancement of a model of performance and decision making under stress in a real life setting
[AD-A285945] p 1449 N95-20393

Designing the architecture of hierachical neural networks model attention, learning and goal-oriented behavior
[AD-A279898] p 1452 N95-20562

A comparison of decision making behaviour in a static and a dynamic task environment as a function of time pressure
[AD-A285389] p 1449 N95-20609

The impact of partnering on construction contracts
[AD-A286588] p 1585 N95-20855

Systems Analysis Laboratory. Ten years of progress 1984-1994
[PB95-104451] p 1464 N95-20982

13th European Annual Conference on Human Decision Making and Manual Control
[PB95-132874] p 1450 N95-21284

Elements of deliberative robot control
[PB95-107595] p 1482 N95-21412

Navigation system in combat vehicle
[PB95-131629] p 1452 N95-21467

NASA/DOD Aerospace Knowledge Diffusion Research Project. Paper 48: Valuing information in an interactive environment
[NASA-TM-110448] p 1590 N95-21977

Information clustering for better decision-making
[AD-A286292] p 1590 N95-22053

DECISION THEORY

Application of Markov decision processes to search problems
[PB95-110813] p 1497 N95-19914

Qualification of the dependence in the generalized extreme value choice model
[PB95-110946] p 1497 N95-19936

TBell: A mathematical tool for analyzing decision tables
[NASA-CR-195027] p 1462 N95-20691

DECODING

Error probabilities of FFH/BFSK with noise normalization and soft decision viterbi decoding in a fading channel with partial-band jamming
[AD-A280041] p 1498 N95-20620

Signal- and listener- based factors in complex auditory pattern perception
[AD-A285636] p 1450 N95-21101

Turbo codes for deep-space communications
p 1304 N95-21535

DECOMPOSITION

Direct catalytic decomposition of nitric oxide
[DE94-018840] p 1233 N95-20045

Accelerated screening methods for determining chemical and thermal stability of refrigerant-lubricant mixtures. Part 2: Experimental comparisons and verification of methods
[DE95-000743] p 1264 N95-20078

A domain decomposition scheme for Eulerian shock physics codes
[DE94-015739] p 1488 N95-20141

An application of wavelet transform for decomposition of millimeter-wave spectroscopic signals
[DE94-018366] p 1402 N95-20247

DNS of turbulent flow in a driven cavity and their analysis using proper orthogonal decomposition
p 1352 N95-21097

Generalised approach to software structure metrics
[PB95-107561] p 1467 N95-21411

Thermal decomposition reactions of HMX and RDX and their importance in predicting cookoff hazards
[DE95-002486] p 1283 N95-21513

Preconditioning via asymptotically-defined domain decomposition
[DE94-019046] p 1493 N95-21564

Bridging the pressure gap: In situ atomic-level investigations of model platinum catalyst surfaces under reaction conditions by scanning tunneling microscopy
[DE95-002346] p 1246 N95-21990

Layered path planning for an autonomous mobile robot
[AD-A286138] p 1485 N95-22244

A multisite interaction expansion of the total energy in metals
[DE94-017175] p 1262 N95-22313

Image and video coding using a wavelet decomposition
[PB95-135067] p 1311 N95-22358

DEEP SPACE

Turbo codes for deep-space communications
p 1304 N95-21535

DEEP SPACE NETWORK

A comparative survey of current and proposed tropospheric refraction-delay models for DSN radio metric data calibration
[NASA-CR-197338] p 1412 N95-20002

The Deep Space Network as an instrument for radio science research
[NASA-CR-197341] p 1302 N95-21456

The Telecommunications and Data Acquisition Report
[NASA-CR-197390] p 1303 N95-21532

DEEP WATER

The Surface Wave Dynamics Experiment (SWADE): A retrospective look at the wave modeling activities
[AD-A285612] p 1431 N95-19895

DEFECTS

Physics and applications of defects in advanced semiconductors, volume 325
[AD-A280059] p 1563 N95-19886

Recognition of subsurface defects in machined ceramics by application of neural networks to laser scatter patterns
[DE94-018373] p 1264 N95-20018

The electronic properties of polysilanes
[DE94-006464] p 1265 N95-20121

Performance, defect behavior and carrier enhancement in low energy, proton irradiated p+nn+ InP solar cells
p 1319 N95-20518

Plastic deformation of ordered intermetallic alloys: Fundamental aspects
[DE95-001070] p 1256 N95-21265

Analysis of a local defect correction approach on composite grids
[PB95-135455] p 1493 N95-21574

Ceramic technology for advanced heat engines
[DE95-000950] p 1278 N95-21937

Minimax optimal stop rule in reliability checking
[PB95-134557] p 1383 N95-21961

Defect classes: An overdue paradigm for CMOS IC testing
[DE94-018905] p 1334 N95-22118

Reflective masks for extreme ultraviolet lithography
[DE95-003427] p 1336 N95-22236

Defect geometries and laser-induced damage in multilayer coatings
[DE94-017695] p 1377 N95-22343

DEFENSE INDUSTRY

Policies concerning military and civilian research and technology applications
[PB95-131355] p 1585 N95-21427

DEFENSE PROGRAM

NRL review, 1994
[AD-A279832] p 1605 N95-20182

Environmental Compliance Assessment and Management Program
[AD-A279605] p 1402 N95-20441

Environmental Compliance Assessment and Management Program (ECAMP), South Carolina supplement
[AD-A279533] p 1408 N95-21689

Environmental Compliance Assessment System (ECAS): Oregon supplement
[AD-A279565] p 1408 N95-21696

Defense Data Repository System (DDRS). End user manual
[AD-A286484] p 1592 N95-22293

DEFLECTION

Determination of layer moduli from falling weight deflectometer measurements
[PB95-129748] p 1286 N95-21333

DEFORMATION

Effect of fiber fabric orientation on the monotonic and fatigue behavior of a continuous fiber ceramic composite
[DE94-018121] p 1271 N95-20700

Approaches to the design of structural ceramics incorporating whiskers and particulate phases
[DE94-018126] p 1271 N95-20704

Geometric moire method of strain analysis with displacement discontinuities
[DE95-001114] p 1386 N95-20833

Prediction of rotor-blade deformations due to unsteady airloads
[AD-A286593] p 1207 N95-20860

Extrudate swell and extrudate distortion of HDPE as a result of different deformation mechanisms during extrusion through capillary dies
[PB95-110227] p 1288 N95-21651

Subduction and volatile recycling in Earth's mantle
p 1421 N95-21802

DEGASSING

Conference on Deep Earth and Planetary Volatiles
[NASA-CR-196944] p 1415 N95-21777

Impact degassing of water and noble gases from silicates p 1416 N95-21780

D/H ratios and H2O contents of mantle-derived amphibole megacrysts from Dish Hill, California
p 1416 N95-21781

Mantle devolatilization and rheology in the framework of planetary evolution p 1418 N95-21788

Rates of Earth degassing p 1422 N95-21809

Surface ices in the outer solar system
p 1423 N95-21815

Degassing history and evolution of volcanic activity of terrestrial planets based on radiogenic noble gas degassing models p 1424 N95-21816

Implications of noble gases in a recently recognized Martian meteorite (ALH84001) for the degassing history of Mars p 1424 N95-21819

Water abundance and accretion history of terrestrial planets p 1424 N95-21820

Degassing mechanisms of noble gases from carbonado diamonds p 1425 N95-21824

DEGENERATION

The preparation of all para-polyphenyls with increased solubility and enhanced third order NLO activity
[AD-A284301] p 1266 N95-20251

DEGRADATION

Degradation of aromatic hydrocarbons in an aquifer during a field experiment demonstrating the feasibility of remediation by natural attenuation
[AD-A283809] p 1282 N95-19922

The use of displacement damage dose to correlate degradation in solar cells exposed to different radiations
p 1320 N95-20523

UV testing of INTELSAT-7, 7A, and 8 solar cells
p 1320 N95-20526

Electromagnetic wave reflection from irregular plasma layers p 1298 N95-20952

Gate oxide shorts in nMOS transistors: Electrical properties and lifetime prediction method
[DE94-018904] p 1330 N95-21545

Performance of Ga(0.47)In(0.53)As cells over a range of proton energies
[NASA-TM-106819] p 1334 N95-22112

DEGREES OF FREEDOM

Three-dimensional laser cooling
[DE94-017963] p 1370 N95-20569

DEHYDRATION

Thermochemistry of dense hydrous magnesium silicates p 1416 N95-21782

Subduction of hydrated basalt of the oceanic crust: Implications for recycling of water into the upper mantle and continental growth p 1423 N95-21814

DEHYDROGENATION

Lower active metals loading for hydrotreating catalysts
[DE94-018907] p 1261 N95-22119

DELAMINATING

The processing and mechanical properties of high temperature/high performance composites. Book 6: Delamination and compressive behavior
[AD-A279780] p 1231 N95-21999

DELETION

Mitigation of effects of multiple path nulls at super-high frequencies through diversity and networking
p 1297 N95-20948

DELTA WINGS

Effect of juncture fillets on double-delta wings undergoing sideslip at high angles of attack
[AD-A286165] p 1207 N95-22039

DEMINERALIZING

Corrosion evaluation of fuel canister crusher rigging
[DE95-002962] p 1257 N95-21452

DEMOGRAPHY
Guidelines for the creation and management of geographic data bases within a GIS environment, version 1.0
[DE94-019214] p 1458 N95-20073
DENDRITIC CRYSTALS
Relationship between dendrite coherency and castability of some commercial foundry alloys
[PB95-110243] p 1258 N95-21652
DENITROGENATION
Lower active metals loading for hydrotreating catalysts
[DE94-018907] p 1261 N95-22119
DENSIFICATION
Processing of intermetallic materials by reaction synthesis
[DE94-017710] p 1263 N95-22345
DENSITY
Connection with dynamics: General introduction
[NASA-CR-197617] p 1579 N95-19947
DENSITY (MASS/VOLUME)
Apparatus and method for determining the mass density of a filament
[NASA-CASE-LAR-14879-1-CU] p 1383 N95-20616
Mixing and dynamics of the Mediterranean outflow
[AD-A279803] p 1434 N95-21306
Gradient index lenses from sol-gel layering
[AD-A285649] p 1242 N95-21402
Quartz resonator fluid monitors for vehicle applications
[DE94-018910] p 1367 N95-21546
DENSITY (NUMBER/VOLUME)
Charge density of fractional charged quasiparticles in the composite fermion picture
[DE94-018122] p 1524 N95-21703
Full potential multiple scattering theory
[DE95-003197] p 1576 N95-22084
DENSITY DISTRIBUTION
Temporal rearrangement of electronic densities in slow atomic collisions
[AD-A279725] p 1516 N95-20994
DENSITY MEASUREMENT
High quality InP-on-Si for solar cell applications
p 1317 N95-20510
Neutron reflectivity study of adsorbed diblock copolymers
[DE95-002740] p 1281 N95-22434
DEOXYRIBONUCLEIC ACID
Biomolecular Materials by Design, volume 330
[AD-A285369] p 1269 N95-20551
Proposal for a tutorial on Minimal Length Encoding (MLE) in molecular biology
[DE94-015076] p 1438 N95-21376
The molecular mechanics program DUPLEX: Computing structures of carcinogen modified DNA by surveying the potential energy surface
[DE94-019153] p 1439 N95-21606
Discovering related DNA sequences via mutual information
[DE95-001101] p 1440 N95-22067
Urban air carcinogens and their effects on health
[DE95-002259] p 1447 N95-22285
Cellular responses to environmental DNA damage
[DE94-015606] p 1441 N95-22397
DEPLETION
The development and evaluation of water-mist fire extinguishing systems
[DE94-019019] p 1286 N95-20356
Application of diode lasers to the isotopically selective determination of uranium in oxides by optogalvanic spectroscopy
[DE94-018045] p 1370 N95-20698
Nitrogen isotopic components in the early solar system p 1420 N95-21800
Alkali element depletion by core formation and vaporization on the early Earth p 1421 N95-21804
Effects of increased UV-B radiation on phytoplankton: A preliminary study and research programme
[PB95-133732] p 1439 N95-21884
DEPLOYMENT
A simple ocean bottom hydrophone with 200 megabyte data capacity
[AD-A279478] p 1434 N95-21677
DEPOLARIZATION
A review of Microbially Induced Corrosion (MIC) of steel and a preliminary investigation to determine its occurrence in naval vessels
[MRL-GD-0048] p 1250 N95-19910
Large bistatic angle clutter depolarization study
p 1296 N95-20941
DEPOSITION
Mixed-sputter deposition of Ni-Ti-Cu shape memory films
[DE94-017296] p 1250 N95-19900
Magnetically controlled deposition of metals using gas plasma
[DE94-018654] p 1251 N95-20128
Rate controlled synthesis of composition modulated, metal-oxide thin films
[DE94-016596] p 1267 N95-20317
Enhanced ionic conduction at the film/substrate interface in LiI thin films grown on sapphire(0001)
[DE94-017884] p 1565 N95-20371
Growth, characterization and device development in monocrystalline diamond films
[AD-A285991] p 1568 N95-20614
Ion scattering and deposition: The role of energetic particles in thin film growth
[AD-A285975] p 1514 N95-20667
Ion-molecule chemistry related to plasma deposition and etching of silicon
[AD-A279749] p 1514 N95-20804
Sputter deposition of multilayer thermoelectric films: An approach to the fabrication of two-dimensional quantum wells
[DE95-002396] p 1272 N95-20892
Use of the National Ignition Facility for the development of inertial fusion energy
[DE94-016696] p 1557 N95-21206
Copper metallization of stainless steels
[DE95-001496] p 1256 N95-21300
Spectroscopic, morphological, and electrical characterization of PdGe ohmic contacts to n-GaAs
[DE95-000738] p 1329 N95-21394
Deposition and properties of novel nitride superlattice coatings
[DE95-002945] p 1230 N95-21445
High performance YBCO films
[AD-A279560] p 1276 N95-21695
Method of making a semiconductor device by forming a nanochannel mask
[AD-D016515] p 1576 N95-22059
Reflective masks for extreme ultraviolet lithography
[DE95-003427] p 1336 N95-22236
Characterization and performance of DLC films synthesized by plasma and ion beam techniques
[DE94-018287] p 1281 N95-22428
DEPOSITS
Atmospheres of the Moon and Mercury
p 1419 N95-21794
Polar volatiles on Mercury and the Moon
p 1422 N95-21811
A new metallographic procedure for edge retention of enclosed surfaces
[DE94-017549] p 1261 N95-22048
DEPTH
An image cancellation approach to depth-from-focus
[DE94-019312] p 1544 N95-21392
Seismic evidence for volatiles at large depth in the Earth p 1422 N95-21808
VTT test borehole for bedrock investigations
[PB95-132965] p 1427 N95-22095
DEPTH MEASUREMENT
Simulation of laser bathymetry for irregular bottoms
[PB95-133518] p 1434 N95-21320
DERIVATION
An improved and facile method for the synthesis of 1,1-bis(4-hydroxyphenyl) 2-phenylethylene and its derivatives
[DE95-001125] p 1240 N95-20836
New improved derivative expansion for field theories with spontaneous symmetry breaking
[DE94-019349] p 1580 N95-21486
Solid-state NMR characterization of C- and N-labelled phthalimides: Model compounds for studying polyimides
[AD-A286479] p 1578 N95-22286
Fully developed turbulent flows
[AD-A286496] p 1358 N95-22294
DESERTIFICATION
Dust Bowl migration as an analog for possible global warming-induced migration from Mexico
[DE94-017472] p 1401 N95-20089
DESIGN
Quadratic forms in design theory
[PB95-111019] p 1487 N95-19940
Si concentrator solar cell development
[DE95-002314] p 1393 N95-20870
DESIGN ANALYSIS
Super-heavy aircraft study
[AD-A279602] p 1215 N95-19955
An intensity interferometer for soft x-rays
[DE94-016370] p 1541 N95-20103
Target Area Structural Support systems design to achieve the micron-level stability requirement of the National Ignition Facility (NIF)
[DE94-017696] p 1551 N95-20219
Characterization of an expanded-field Schwarzschild objective for extreme ultraviolet lithography
[DE94-016780] p 1541 N95-20239
Parallel calculation of sensitivity derivatives for aircraft design using automatic differentiation
[NASA-TM-110103] p 1206 N95-20370
A low temperature, ultrahigh vacuum, microwave-frequency-compatible scanning tunneling microscope
[AD-A279869] p 1365 N95-20413
Legged vehicle for underwater mobile operations
[AD-A285043] p 1480 N95-20482
Goddard Space Flight Center solar array missions, requirements and directions p 1316 N95-20503
Design of high-efficiency, radiation-hard, GaInP/GaAs solar cells p 1319 N95-20521
Preliminary control system design and analysis for the Space Station Furnace Facility thermal control system
[NASA-TM-108476] p 1365 N95-20560
Conceptual design of an RTG Facility Transportation System
[DE94-014443] p 1379 N95-20627
Development of a tester for evaluation of prototype thermal cells and batteries
[DE95-000540] p 1325 N95-20628
Improving Multichip Module (MCM) design and reliability using the Intelligent MCM Analyzer
p 1209 N95-20637
An evaluation of Automatic Terminal Information Service (ATIS) flight deck display presentation options
[AD-A280100] p 1204 N95-21020
Preliminary study of HUTSAT microsatellite
[PB95-127619] p 1220 N95-21026
Proceedings of the NATO-Advanced Study Institute on Computer Aided Analysis of Rigid and Flexible Mechanical Systems. Volume 1: Main lectures
[AD-A286062] p 1380 N95-21171
Heterogeneous multi-robot cooperation
[AD-A279839] p 1481 N95-21185
Development of a portable ice-thickness measuring instrument
[AD-A279472] p 1433 N95-21291
Overview of data fusion work for land electronic warfare
[AD-A279829] p 1301 N95-21292
The Photovoltaic Higher Education National Exemplar Facility (PHENEF)
[DE94-015641] p 1395 N95-21409
Design principles for real-time process control systems
[PB95-132890] p 1585 N95-21414
The advanced technology crew station: Development and validation of a workload assessment technique for cockpit function allocation
[AD-A279544] p 1453 N95-21691
Development of active-transport membrane devices
[DE94-015947] p 1246 N95-21921
Taking AIM: The management of scientific and technical information at Argonne National Laboratory
[DE94-019279] p 1591 N95-22092
Normal form analysis of the Tevatron
[DE94-017172] p 1539 N95-22192
Derivation of a wavenumber filter design for the measurement of turbulent wall pressure fluctuations
[AD-A286421] p 1357 N95-22208
High performance computing for beam physics applications
[DE94-018312] p 1539 N95-22243
CALIOPE and TAISIR airborne experiment platform
[DE94-018328] p 1310 N95-22299
The superconducting magnet system for the Tokamak Physics Experiment
[DE94-018329] p 1562 N95-22300
3-D TECATE/BREW: Thermal, stress, and birefringent ray-tracing codes for solid-state laser design
[DE95-000330] p 1376 N95-22301
Research on the power generation system with thermoelectric conversion elements
[DE95-714804] p 1397 N95-22309
Wave journal bearing. Part 1: Analysis
[NASA-CR-195431-PT-1] p 1382 N95-22404
Design of a massively parallel computer using bit serial processing elements
[NASA-CR-197365] p 1479 N95-22406
DESIGN TO COST
Cost estimating methods for advanced space systems
p 1583 N95-20741
European Workshop on Optical Ground Truth Instrumentation for the Validation of Space-Borne Optical Remote Sensing Data of the Marine Environment
[PB95-134144] p 1390 N95-21872
DESORPTION
Time-resolved analytical methods for liquid/solid interfaces
[DE95-002255] p 1240 N95-20780
International Symposium on Advanced Laser Technologies
[AD-A279849] p 1376 N95-22164
DESTRUCTIVE TESTS
UV testing of INTELSAT-7, 7A, and 8 solar cells
p 1320 N95-20526

The application of a statistical analysis software package to explosive testing
[MRL-TR-93-42] p 1284 N95-21658

DETECTION
Sol-gel-derived silica films with tailored microstructures for applications requiring organic dyes
[DE94-018886] p 1264 N95-20047
The GPS Burst Detector W-Sensor
[DE94-017406] p 1204 N95-20269
Analysis of direct detection lightwave systems with optical amplifiers
[AD-A284077] p 1542 N95-20467
Electrochemical impedance pattern recognition for detection of hidden chemical corrosion on aircraft components
[AD-A285998] p 1239 N95-20716
Modelling of microwave propagation and clutter in a maritime environment p 1295 N95-20938
Adaptive detection in stationary and nonstationary noise environments
[AD-A279581] p 1300 N95-21099
Electron tunneling magnetic field sensor
[AD-D016227] p 1365 N95-21117
Visible fluorescence of weathered lead
[DE95-002454] p 1244 N95-21523
New concepts for refrigerant leak detection and mixture measurement
[DE94-018967] p 1287 N95-21559
Fiber grating-based detection system for wavelength encoded fiber sensors
[AD-D016208] p 1545 N95-21825
Adaptive fault-resistant systems
[AD-A286406] p 1484 N95-22203
Threshold detection in the presence of atmospheric turbulence
[AD-A286175] p 1427 N95-22249

DETECTORS
Materials for adaptive structural acoustic control, volume 2
[AD-A279222] p 1502 N95-19883

DETERIORATION
Test Operations Procedure (TOP) 1-2-616 tropic exposure testing
[AD-A286376] p 1235 N95-20230
Detection of environmental deterioration in fiber reinforced composites by FT-Raman spectroscopy, phase 1
[AD-A279763] p 1228 N95-20805
Evaluation of dried storage of platelets for transfusion: Physiologic integrity and hemostatic functionality
[AD-A286078] p 1443 N95-20850

DETERMINANTS
Patterns of financial change in the OECD area
[PB95-110979] p 1594 N95-19939
Sharp determinants
[PB95-111068] p 1488 N95-19944

DETONATION
Sequential shock induced switch tests for Eglin Air Force Base
[DE95-001786] p 1334 N95-22062

DETONATION WAVES
Proceedings of the Zel'Dovich Memorial International Conference on Combustion, Detonation, Shock Waves, volume 2
[AD-A286626] p 1239 N95-20769
One-dimensional reactive Euler equations
[PB95-135430] p 1244 N95-21573

DEUTERIUM
A new alpha particle diagnostic using knock-on ion tails
[DE94-015856] p 1553 N95-20402
Experimental investigation of molecular beam injection in HL-1 tokamak
[DE94-631456] p 1556 N95-21165
Review of recent D-T experiments from TFTR
[DE95-002755] p 1557 N95-21239
Heating and transport in TFTR D-T plasmas
[DE95-002812] p 1558 N95-21242
Experimental investigations of electron capture from atomic hydrogen and deuterium by alpha particles
[DE95-002138] p 1523 N95-21587
Time of flight spectroscopy with muonic hydrogen
[DE94-017056] p 1245 N95-21845
Structure functions and structure function ratio F(sup n)2/F(sup p)2 at small x(sub Bj) and Q2 in muon-nucleon scattering
[DE94-017981] p 1530 N95-22340

DEUTERIUM PLASMA
Helium exhaust studies in the D3-D tokamak
[DE94-016682] p 1552 N95-20334
Heating and transport in TFTR D-T plasmas
[DE95-002812] p 1558 N95-21242

DEUTERONS
There might be two kinds of dibaryon
[DE94-014417] p 1526 N95-22058
On conception of a compact neutron source and the possibility of its simulation on the Amba-M end trap
[DE94-633373] p 1562 N95-22282

DIAGNOSIS
Mechanisms and diagnostics of ultrashort pulse laser ocular effects
[AD-A285610] p 1373 N95-21195
Proceedings of the NATO-Advanced Study Institute on Computer Aided Analysis of Rigid and Flexible Mechanical Systems. Volume 2: Contributed papers
[AD-A286063] p 1381 N95-21488
Radiopharmaceuticals for diagnosis
[DE95-002200] p 1445 N95-21595
Advanced Materials and Process Technology for Mechanical Failure Prevention (proceedings of the 48th Meeting of the Mechanical Failures Prevention Group
[AD-A285785] p 1233 N95-22399

DIAGRAMS
Hierarchical diagrammatic representation of class structure
[PB95-110722] p 1456 N95-19908

DIAMINES
A direct process for preparing semi-crystalline polyimides
[NASA-CASE-LAR-15020-1] p 1268 N95-20407

DIAMOND FILMS
Growth, characterization and device development in monocrystalline diamond films
[AD-A285991] p 1568 N95-20614
The in situ observation of epitaxial diamond thin film nucleation and growth using emission electron microscopy
[AD-A279811] p 1569 N95-20807
Atmosphere influence on in situ ion beam analysis of thin film growth
[DE95-001507] p 1570 N95-20881
Friction and wear properties of as-deposited and carbon ion-implanted diamond films
[NASA-TM-106759] p 1274 N95-21252
Analysis of cost: Combustion flame CVD diamond deposition
[AD-A279153] p 1278 N95-21973
Growing and releasing diamonds
[AD-D016489] p 1577 N95-22103
Technical cost modeling applied to CVD diamond deposition
[AD-A286119] p 1578 N95-22231

DIAMONDS
Numerical controlled polishing program, continued forced wear and part correction experiments
[DE94-018084] p 1285 N95-20288
Refractive index change in dissociating shocked benzene
[DE94-019015] p 1541 N95-20352
Materials processing and manufacturing technologies for diamond substrates multichip modules
[AD-A285060] p 1315 N95-20488
Conference on Deep Earth and Planetary Volatiles
[NASA-CR-196944] p 1415 N95-21777
Noble gas isotopes and halogens in volatile-rich inclusions in diamonds p 1417 N95-21784
Solar helium and neon in the Earth
p 1419 N95-21793
Volatiles in the deep Earth: An experimental study using the laser-heated diamond cell p 1421 N95-21803
Degassing mechanisms of noble gases from carbonado diamonds p 1425 N95-21824
Growing and releasing diamonds
[AD-D016489] p 1577 N95-22103
Advanced diagnostics for plasma chemistry
[DE94-018936] p 1561 N95-22116
Technical cost modeling applied to CVD diamond deposition
[AD-A286119] p 1578 N95-22231
Materials processing and manufacturing technologies for diamond substrates multichip modules
[AD-A285775] p 1336 N95-22412

DIAPHRAGM (ANATOMY)
Method and apparatus for non-invasive evaluation of diaphragmatic function
[NASA-CASE-LAR-13888-1] p 1441 N95-20408

DIATOMIC GASES
Plasma chemistry of vibrationally nonequilibrium molecules
[AD-A279630] p 1553 N95-20411

DIATOMIC MOLECULES
Plasma chemistry of vibrationally nonequilibrium molecules
[AD-A279630] p 1553 N95-20411
T1F ((1) sigma (+)): Some preliminary electronic structure calculations
[PB95-130316] p 1518 N95-21223
Interference of fluorescence x rays and coherent excitation of core levels
[DE94-016809] p 1527 N95-22188

DIBORANE
Atomically resolved structure and bonding of delta-doped boron layers on Si(001)
[AD-A279820] p 1513 N95-20586

DICHROISM
Theoretical prediction of vibrational circular dichroism spectra of R-glyceraldehyde, R-erythrose, and R-threose. Part 2: Development of a procedure to scale the force constant matrix expressed in terms of internal coordinates
[AD-A284305] p 1437 N95-20252
Orientation studies of polyolefins by IR-dichroism
[PB95-104386] p 1236 N95-20256
Magnetic x ray circular dichroism in Fe Co Pt multilayers
[DE94-017522] p 1253 N95-20447
Spin-specific photoelectron diffraction using magnetic x ray circular dichroism
[DE94-017527] p 1567 N95-20448
A structural determination using magnetic x ray circular dichroism in spin-polarized photoelectron diffraction
[DE94-017528] p 1567 N95-20449
Magnetic x-ray circular dichroism in spin-polarized photoelectron diffraction
[DE95-002394] p 1520 N95-21360

DICTIONARIES
Abbreviations and acronyms
[NASA-TM-110506] p 1590 N95-21457
Glossary of frequency and timing terms and a pictorial representation of terms used in the behavior and analyses of frequency standards
[AD-A286172] p 1310 N95-22247

DIELECTRIC PROPERTIES
The role of high pressure in the study and applications of the ferroelectric polymer polyvinylidene fluoride and its copolymers
[DE94-015742] p 1268 N95-20396

DIELECTRICS
Tests of dielectric model descriptions of chemical charge displacements in water
[DE94-007530] p 1236 N95-20277
Materials research for GHz multi-chip modules
[AD-A279661] p 1227 N95-20412
Reliability assessment of Multichip Module technologies via the Triservice/NASA RELTECH program
p 1210 N95-20643
Ferroic materials: Design, preparation and characteristics. Ceramic transactions, volume 43
[AD-A285937] p 1270 N95-20664
Effect of a solid insulator on the spark yield of S2F10 in SF6(*)
[DE95-001422] p 1326 N95-20791
Low-frequency image theory for a current dipole in front of a permeable sphere
[PB95-127676] p 1300 N95-21104
Dielectric models in adhesion and extrapolations of molecular modeling
[AD-A279675] p 1516 N95-21121
Role of dielectric constant in electrohydrodynamics of conducting fluids
[NASA-TM-110499] p 1331 N95-21614
Localization phenomenon in some random classical systems
[AD-A286514] p 1309 N95-22215
Dielectric mixtures with arbitrarily anisotropic components: Focus on special gyrotropic effects
[PB95-127015] p 1311 N95-22363
Image theory for the unidirectionally conducting screen
[PB95-127031] p 1311 N95-22365
Unique microchannel plate process doubles MCPI resolution
[DE94-017507] p 1337 N95-22427

DIES
Improved die castings through plasma surface modification, improved sensors and die soldering prevention
[DE95-002238] p 1253 N95-20417
Extrudate swell and extrudate distortion of HDPE as a result of different deformation mechanisms during extrusion through capillary dies
[PB95-110227] p 1288 N95-21651
Consortia for Known Good Die (KGD), phase 1
[AD-A279407] p 1383 N95-21933

DIESEL ENGINES
Trimode Power Converter optimizes PV, diesel and battery energy sources
[DE94-015014] p 1313 N95-20262
Abrasive wear by diesel engine coal-fuel and related particles
[PB95-104915] p 1379 N95-20984

DIESEL FUELS
Reducing exhaust gas emissions from Citydiesel busses
[DE95-700245] p 1380 N95-21295

DIFFERENCE EQUATIONS
The Nonlinear Characteristic scheme in X-Y geometries
[DE94-016192] p 1488 N95-20167
Computation of transonic flow on composite overlapping grids in 2 D
[PB95-131348] p 1353 N95-21132
DIFFERENTIAL ABSORPTION LIDAR
Continuously-tunable, narrow-linewidth, Q-switched Cr:LiSAF laser for lidar applications
[DE95-000862] p 1373 N95-21312
Lidar technologies for airborne and space-based applications
[DE95-002954] p 1302 N95-21448
DIFFERENTIAL ANALYZERS
The determination of static and time varying dipole source. Sensor geometry during sea trials using differential global positioning system
[MRL-TN-631] p 1205 N95-21642
DIFFERENTIAL EQUATIONS
Asymptotic analysis of Nash equilibria in nonzero-sum linear-quadratic differential games. The two-player case
[PB95-111027] p 1499 N95-19941
On the differential representations of quantum Lie superalgebras
[DE94-629874] p 1491 N95-20734
On FEL integral equation and electron energy loss in intermediate gain regime
[DE94-770631] p 1371 N95-20757
Temporal rearrangement of electronic densities in slow atomic collisions
[AD-A279725] p 1516 N95-20994
Explicit methods for stiff ODEs from atmospheric Chemistry
[PB95-135794] p 1404 N95-21034
On the transition towards slow manifold in shallow-water and 3D Euler equations in a rotating frame
p 1345 N95-21057
Computation of transonic flow on composite overlapping grids in 2 D
[PB95-131348] p 1353 N95-21132
The PROSAIC Laplace and Fourier Transform
[DE95-002225] p 1492 N95-21266
Structure functions and structure function ratio F2(n)/F2(p) at low X(Bj) and Q2 in inelastic muon scattering
[DE94-018979] p 1573 N95-21561
Measurement of the B meson differential cross-sections in p(bar p) collisions at (radical)s = 1.8 TeV using the exclusive decays B(sup (+-)) (yields) J/(psi)K(sup (+-)) and B(sup 0) (yields) J/(psi)K*(sup 0)
[DE94-018993] p 1523 N95-21562
Preconditioning via asymptotically-defined domain decomposition
[DE94-019046] p 1493 N95-21564
Maximum weighted matching for high index differential algebraic equations
[PB95-135075] p 1496 N95-22359
Self-similar solutions of a fast diffusion equation that do not conserve mass
[PB95-134920] p 1497 N95-22375
DIFFERENTIAL GEOMETRY
Marussi hypothesis in differential geodesy
[AD-A285853] p 1413 N95-20377
DIFFERENTIAL PRESSURE
Optical fiber pressure sensor for liquid level monitoring
[AD-D016246] p 1547 N95-22089
DIFFERENTIATION
Optimizing the length of the stores and related effects
[DE95-002531] p 1533 N95-20885
DIFFRACTION
Hard diffraction and rapidity gaps
[DE95-000565] p 1507 N95-20111
Spin dependence of diffractive processes and implications for the small x behaviour of g1 and the spin content of the nucleon
[PB95-130332] p 1518 N95-21225
Magnetic x-ray circular dichroism in spin-polarized photoelectron diffraction
[DE95-002394] p 1520 N95-21360
Polycrystalline PLZT/ITO ceramic electro-optic phase gratings: Electro-optically reconfigurable difffractive devices for free-space and in-wafer interconnects
[AD-A285861] p 1547 N95-22076
Design, fabrication, and characterization of reflective diffractive optical elements in Si for free-space optical interconnects
[AD-A286416] p 1547 N95-22205
DIFFRACTION PATTERNS
Physical-chemical studies on rodlike polymer compositions
[AD-A285361] p 1269 N95-20548
Angle resolved Auger electron spectroscopy: An alternate tool for identifying electronic excitation processes in solids
[AD-A285375] p 1238 N95-20555
Characterization of a texture gradient in tantalum plate
[DE95-002704] p 1262 N95-22289
DIFFRACTOMETERS
Role of internal stresses in fracture behavior of engineering composites
[DE95-001106] p 1229 N95-20912
Reciprocal space mapping of epitaxial materials using position-sensitive x-ray detection
[DE95-001620] p 1575 N95-21991
DIFFUSE RADIATION
Diffuse reflectance spectra of energetic material
[DSTO-TR-0065] p 1284 N95-21951
DIFFUSERS
Large-eddy simulation of flow through a plane, asymmetric diffuser p 1360 N95-22449
DIFFUSION
Diffusion enhances spontaneous electroweak baryogenesis
[DE94-017574] p 1512 N95-20451
Skeletal muscle ischemia and heat shock proteins
[AD-A285364] p 1442 N95-20549
Preclinical investigation of lyophilized platelet preparations
[AD-A286079] p 1443 N95-20851
Role of pressure diffusion in non-homogeneous shear flows p 1345 N95-21053
Comparison of calculated with measured dynamic aperture
[DE95-002863] p 1534 N95-21246
Quantum diffusion
[DE95-001015] p 1580 N95-21264
NESTLE: Few-group neutron diffusion equation solver utilizing the nodal expansion method for eigenvalue, adjoint, fixed-source steady-state and transient problems
[DE95-001903] p 1466 N95-21288
Computational modeling of diffusion-controlled transformations in ternary systems
[DE95-001358] p 1256 N95-21298
Defect production and recombination during low-energy ion processing
[DE95-001827] p 1572 N95-21304
Loss of solar He and Ne from IDPS in subducting sediment: Diffusion and the effect of phase changes
p 1419 N95-21792
Degassing mechanisms of noble gases from carbonado diamonds p 1425 N95-21824
Selection of RIB targets using ion implantation
[DE95-000951] p 1538 N95-21938
Self-similar solutions of a fast diffusion equation that do not conserve mass
[PB95-134920] p 1497 N95-22375
DIFFUSION COEFFICIENT
Quasi-linear equation for magnetoplasma oscillations in the weakly relativistic approximation
[DE94-628932] p 1560 N95-21593
Loss of solar He and Ne from IDPS in subducting sediment: Diffusion and the effect of phase changes
p 1419 N95-21792
DIFFUSION FLAMES
Heat transfer, fouling, and combustion of supercritical fuels
[AD-A279906] p 1281 N95-19884
Effects of non-unity Lewis numbers in diffusion flames
p 1249 N95-21036
Effect of chemical heat release in a temporally evolving mixing layer p 1249 N95-21037
Triple flame structure and diffusion flame stabilization
p 1249 N95-21039
A flamelet model for turbulent unpremixed combustion
p 1249 N95-21081
DIFFUSION THEORY
Error analysis of the quadratic nodal expansion method in slab geometry
[DE95-001352] p 1492 N95-21285
NESTLE: Few-group neutron diffusion equation solver utilizing the nodal expansion method for eigenvalue, adjoint, fixed-source steady-state and transient problems
[DE95-001903] p 1466 N95-21288
DIFFUSION WELDING
Joining of dissimilar materials. A review
[PB95-132999] p 1380 N95-21416
Forming of superplastic ceramics
[DE94-017306] p 1276 N95-21662
DIFFUSIVITY
Current diffusive ballooning mode in second stability region of tokamaks
[DE94-770690] p 1554 N95-20683
Observation of non diffusive term of toroidal momentum transport in the JFT-2M tokamak
[DE94-770686] p 1555 N95-20989
Assessment of database for interaction of tritium with ITER plasma facing materials
[DE95-002038] p 1558 N95-21290
The permeation of bis(2-fluoro-2,2-dinitroethyl) formal (FEFO), ethyl 4,4-dinitropentanoate (EDNP), ethyl 4-nitropentanoate (ENP), and 1,2,4-trichlorobenzene (TCB) through barrier membranes
[DE95-002492] p 1283 N95-21514
Degassing mechanisms of noble gases from carbonado diamonds p 1425 N95-21824
DIGITAL COMPUTERS
Optimal distributed control system for a linear distributed parameter system
[AD-D016583] p 1480 N95-20202
Long sequence correlation coprocessor
[AD-D016558] p 1313 N95-20280
Circuit means for providing compatibility between two separate digital data interfaces
[AD-D016225] p 1455 N95-21116
DIGITAL DATA
Circuit means for providing compatibility between two separate digital data interfaces
[AD-D016225] p 1455 N95-21116
Subsampling methods for image sequence coding
[PB95-107991] p 1305 N95-21579
Common mapping system media study
[AD-A279086] p 1390 N95-21912
Digital mapping, charting, and geodesy analysis program technical review of Vector Smart Map (VMap) level 1
[AD-A286294] p 1390 N95-22055
DIGITAL ELECTRONICS
Evaluation of superconducting quantum interference devices interfaced with digital signal processing electronics for biomagnetic applications
[DE94-016186] p 1289 N95-20164
Solid state research
[AD-A279662] p 1567 N95-20426
Advanced Packaging Concepts for Digital Avionics
[AGARD-CP-562] p 1208 N95-20631
High density monolithic packaging technology for digital/microwave avionics p 1211 N95-20646
Modular supplies for a distributed architecture --- avionics packaging p 1213 N95-20657
HTS Josephson technology on silicon with application to high speed digital microelectronics
[AD-A285964] p 1328 N95-21178
High temperature superconducting films and multilayers for electronics
[AD-A279545] p 1331 N95-21693
Uninterrupted, enhanced-rate event sequencer with mixed-speed counter modules
[AD-D016255] p 1334 N95-22030
DIGITAL FILTERS
Digital filtering for data compression in telemetry systems
[DE94-016611] p 1219 N95-20567
Saddle-node dynamics for edge detection
[DE94-017415] p 1473 N95-22426
DIGITAL SIMULATION
Preliminary control system design and analysis for the Space Station Furnace Facility thermal control system
[NASA-TM-108476] p 1365 N95-20560
DIGITAL SYSTEMS
Determining the usability of Digital Video Interactive (DVI) technology in computer-based instruction
[AD-A284717] p 1457 N95-20060
DSP control of superconducting quantum interference devices
[DE94-016193] p 1313 N95-20168
Preliminary evaluation of a digital optical systolic processor implemented with acousto-optic cells
[AD-A286377] p 1541 N95-20231
The GPS Burst Detector W-Sensor
[DE94-017406] p 1204 N95-20269
General purpose sidelobe canceller system
[AD-D016560] p 1289 N95-20270
Ultra-Reliable Digital Avionics (URDA) processor
p 1209 N95-20638
Innovative use of DSP technology in space: FORTE event classifier
[DE94-016086] p 1291 N95-20697
Shaping the library of the future: Digital library developments at Los Alamos National Laboratory's Research Library
[DE95-001008] p 1588 N95-20777
Propagation measurements on a troposcatter link in the Canadian High Arctic p 1295 N95-20940
HTS Josephson technology on silicon with application to high speed digital microelectronics
[AD-A285964] p 1328 N95-21178
Surface micromachined capacitive tactile image sensor
[PB95-108031] p 1288 N95-21633
DOD science and engineering apprenticeship program for high school students
[AD-A280371] p 1583 N95-22100
TDX: A high-bandwidth crossbar-switched communication paradigm
[DE94-017187] p 1311 N95-22407

DIGITAL TECHNIQUES
Vibration analysis of the AN/SPS-67(V)3 surface search radar
[AD-A286050] p 1302 N95-21324
Monolithic circuits for lead-glass calorimetry
[DE94-019112] p 1330 N95-21554
DIGITAL TELEVISION
Determining the usability of Digital Video Interactive (DVI) technology in computer-based instruction
[AD-A284717] p 1457 N95-20060
Geometric moire method of strain analysis with displacement discontinuities
[DE95-001114] p 1386 N95-20833
DIISOCYANATES
Polyurethane-acrylic interpenetrating polymer network acoustic damping material
[AD-D016572] p 1266 N95-20294
DILATATIONAL WAVES
A model of an infinite length, axisymmetric, isotropic, forced thick shell
[AD-A285586] p 1386 N95-21212
DILUTION
Emittance dilution by ions in the SLC arcs
[DE95-002871] p 1536 N95-21332
DIMENSIONAL MEASUREMENT
Nonlinear spectroscopy of multicomponent droplets and two- and three-dimensional measurements in flames
[AD-A279945] p 1238 N95-20581
Effects of yaw and pitch motion on model attitude measurements
[NASA-TM-4641] p 1368 N95-22109
DIMENSIONAL STABILITY
Large amplitude localized structures in a relativistic electron-positron ion plasma
[DE94-628965] p 1561 N95-21851
DIMENSIONLESS NUMBERS
Application of a dimensionless parameter model for Laser Beam Welding
[DE94-018902] p 1378 N95-20048
DIMENSIONS
The effects of three-dimensional graphs on decision making
[AD-A285034] p 1583 N95-20051
DIMERS
An atomically-resolved STM study of the thermal decomposition of disilane on Si(001)
[AD-A279818] p 1567 N95-20544
An atomically-resolved STM study of the interaction of phosphine (PH3) with the silicon (001) surface
[AD-A279819] p 1513 N95-20585
Atomically resolved structure and bonding of delta-doped boron layers on Si(001)
[AD-A279820] p 1513 N95-20586
Gas-phase generation of zinc sulfide particles using a single-source precursor
[AD-A279700] p 1239 N95-20712
DIODES
Charged particle dynamics in the acceleration gap of the PBFA 2 ion diode
[DE94-017347] p 1506 N95-20026
Particle beam fusion
[DE95-000711] p 1549 N95-20075
Impedance characteristics of multistage ion diodes
[DE94-018887] p 1565 N95-20340
Application of diode lasers to the isotopically selective determination of uranium in oxides by optogalvanic spectroscopy
[DE94-018045] p 1370 N95-20698
LIF standoff research
[DE94-018744] p 1535 N95-21328
RF vacuum microelectronics based on thin film edge-emitter technology
[AD-A279539] p 1331 N95-21690
DIOPHANTINE EQUATION
Quadratic forms in design theory
[PB95-111019] p 1487 N95-19940
DIPOLE ANTENNAS
A colocated magnetic loop, electric dipole array antenna (preliminary results)
[AD-A285381] p 1290 N95-20556
Small antennas for communication over sea ice
[AD-D016206] p 1301 N95-21156
DIPOLE MOMENTS
Investigation of spherical tearing mode
[NASA-CR-197284] p 1558 N95-21345
The determination of static and time varying dipole source. Sensor geometry during sea trials using differential global positioning system
[MRL-TN-631] p 1205 N95-21642
Constraints on T-odd and P-even hadronic interactions from nucleon, nuclear, and atomic electric dipole moments
[DE94-012845] p 1526 N95-21920
DIPOLES
Investigating the resolution of resistivity arrays using inverse theory
[DE94-017760] p 1412 N95-20287
DIRECT CURRENT
DC potential anomalies caused by a conducting body in an anisotropic conducting half-space
[PB95-127106] p 1291 N95-20775
DIRECT POWER GENERATORS
Trimode Power Converter optimizes PV, diesel and battery energy sources
[DE94-015014] p 1313 N95-20262
DIRECTION FINDING
Superresolution direction finding algorithms for the characterisation of multi-moded HF signals
p 1299 N95-20958
DIRECTIONAL ANTENNAS
Directive optimization of coherent sidelobe canceller systems
[AD-D016513] p 1307 N95-21908
DIRECTIONAL SOLIDIFICATION (CRYSTALS)
Directional solidification of the alumina-zirconia ceramic eutectic system
[DE95-001677] p 1277 N95-21735
The influence of chemistry and microstructure on the fracture toughness of V-V3Si in-situ composites
[DE94-018997] p 1232 N95-22126
DIRICHLET PROBLEM
Analysis of a local defect correction approach on composite grids
[PB95-135455] p 1493 N95-21574
DISCONTINUITY
Geometric moire method of strain analysis with displacement discontinuities
[DE95-001114] p 1386 N95-20833
DISCRETE FUNCTIONS
Qualification of the dependence in the generalized extreme value choice model
[PB95-110946] p 1497 N95-19936
Semi-global stabilization of linear discrete-time systems subject to input saturation via linear feedback: An ARE-based approach
[PB95-135463] p 1483 N95-21618
Discrete algebraic Riccati equation and linear matrix inequality
[PB95-133575] p 1484 N95-22139
On the dynamics of a shock-bubble interaction
[NASA-CR-194978] p 1495 N95-22325
DISCRIMINANT ANALYSIS (STATISTICS)
Multilayer piecewise linear networks
[AD-A285382] p 1480 N95-20606
DISEASES
Netherlands Institute for Brain Research progress report, 1993
[PB95-135398] p 1445 N95-21352
DISILICIDES
Third Intermetallic Matrix Composites Symposium, volume 350
[NASA-TM-110059] p 1225 N95-20001
The thermal conductivity of silicon nitride with molybdenum disilicide additions
[DE94-017757] p 1247 N95-22260
DISK OPERATING SYSTEM (DOS)
Personal computer and workstation operating systems tutorial
[AD-A280132] p 1451 N95-20041
DOS basics
[DE94-018434] p 1455 N95-21632
DISLOCATIONS (MATERIALS)
Microscopy of stress-induced morphological development and dislocation nucleation during semiconductor epitaxy
[DE94-017869] p 1568 N95-20674
Simulations of metal dissolution and corrosion
[DE94-019295] p 1257 N95-21476
DISPERSING
Diffraction applications using the energy dispersive beamline, X6A, at NSLS
[DE94-019287] p 1572 N95-21408
DISPERSION
Three-dimensional laser cooling
[DE94-017963] p 1370 N95-20569
DISPERSIONS
Proceedings of the 4th International Conference on Electrorheological Fluids
[AD-A286341] p 1266 N95-20227
Low emittance lattices for electron storage rings revisited
[DE94-017302] p 1540 N95-22391
DISPLACEMENT
The use of displacement damage dose to correlate degradation in solar cells exposed to different radiations
p 1320 N95-20523
Study of superconvergence by a computer-based approach: Superconvergence of the gradient of the displacement, the strain and stress in finite element solutions for plane elasticity
[AD-A279885] p 1490 N95-20588
Geometric moire method of strain analysis with displacement discontinuities
[DE95-001114] p 1386 N95-20833
LLNL/Lion Precision LVDT amplifier
[DE95-001504] p 1327 N95-20854
DISPLACEMENT MEASUREMENT
LLNL/Lion Precision LVDT amplifier
[DE95-001504] p 1327 N95-20854
DISPLAY DEVICES
A 3D stereo data visualization and representation
[AD-A284786] p 1449 N95-20064
Space constancy on video display terminals
[AD-A280015] p 1449 N95-20314
The impact of advanced packaging technology on modular avionics architectures p 1208 N95-20632
Computer based analysis and synthesis of retinal function
[AD-A286084] p 1443 N95-20811
Seminar on Biomedical Engineering 1993
[PB95-104402] p 1443 N95-20971
Color control in a multichannel simulator display: The display for advanced research and training
[AD-A279717] p 1216 N95-20992
Visual displays and Neuro-Linguistic Programming
[DE95-001454] p 1466 N95-21311
Data link terminal DLT document
[PB95-110805] p 1205 N95-21369
Information clustering for better decision-making
[AD-A286292] p 1590 N95-22053
Evaluation of the Haworth-Newman avionics Display Readability Scale
[AD-A286127] p 1214 N95-22232
DISSIPATION
The GPS Burst Detector W-Sensor
[DE94-017406] p 1204 N95-20269
A cheap DNS tool for turbulence models testing
p 1348 N95-21072
DISSOCIATION
Refractive index change in dissociating shocked benzene
[DE94-019015] p 1541 N95-20352
A new family of anion receptors and their effects on ion pair dissociation and conductivity of lithium salts in non-aqueous solutions
[DE94-016822] p 1512 N95-20477
Electrospray ionization Fourier transform ion cyclotron resonance mass spectrometric study of singly and doubly charged organometallic complexes
[AD-A279899] p 1238 N95-20563
Electron attachment to excited molecules
[DE94-019124] p 1522 N95-21519
Comparative computational analysis of some nitramine and difluoramine structures, dissociation energies and heats of formation
[AD-A286196] p 1525 N95-21878
DISSOLVING
Simulations of metal dissolution and corrosion
[DE94-019295] p 1257 N95-21476
DISTRIBUTED PARAMETER SYSTEMS
Heterogeneous multi-robot cooperation
[AD-A279839] p 1481 N95-21185
International Conference on Control and Estimation of Distributed Parameter Systems: Nonlinear Phenomena
[AD-A286449] p 1493 N95-21582
DISTRIBUTED PROCESSING
System level fault tolerance in parallel and distributed computing systems
[AD-A279664] p 1474 N95-20305
Stochastic network processes
[AD-A279905] p 1475 N95-20566
Fault-tolerance in distributed and multiprocessor real-time systems
[AD-A279896] p 1461 N95-20595
Environment for Test and Analysis of Distributed Software (ETADS)
[AD-A285776] p 1463 N95-20877
Polymer based all-optic reconfigurable interconnects
[AD-A279976] p 1272 N95-20962
GRONICs-1994. Proceedings of the 1994 Groningen Student Conference on Computer Science
[PB95-135620] p 1468 N95-21455
PVM 3 beyond network computing
[DE94-019115] p 1477 N95-21556
PVM a platform for portable distributed computing
[DE94-019156] p 1455 N95-21607
Design model for open distributed processing systems
[PB95-135505] p 1477 N95-21620
Status of CFDLIB performance tests on the T3D
[DE95-002708] p 1478 N95-21925
Massively-parallel computational fluid dynamics
[AD-A279389] p 1355 N95-21942

Modelling multimedia teleservices with OSI upper layers framework: Short paper
[PB95-132734] p 1308 N95-22080
Network distributed global memory for transparent message passing on distributed networks
[AD-A286096] p 1478 N95-22228
Computing symmetries and stubborn sets
[PB95-127700] p 1472 N95-22328
Time and the order of abstract events in distributed computations
[PB95-110482] p 1496 N95-22349
A periodic scheduling heuristic for mapping iterative task graphs onto distributed memory multiprocessors
[AD-A286047] p 1311 N95-22415

DISTRIBUTION FUNCTIONS
Moment approach to high-order accelerator beam optics
[DE95-001018] p 1536 N95-21331
Exponential deconvolution: Two asymptotically equivalent estimators
[PB95-132122] p 1499 N95-21469
Bayesian analysis of semiparametric proportional hazards models
[AD-A279394] p 1499 N95-21946
Exponents in lifetime and power spectral density forms in self-organized critical systems
[AD-A286242] p 1495 N95-22026
Counting methods for the analysis of load time histories
[PB95-132916] p 1388 N95-22093
An analytical electron distribution function for inelastic collisions in a uniform gas with time varying electric field
[DE95-003476] p 1528 N95-22222
An analytical, inelastic, space and time dependent electron distribution for electrically excited gases
[DE95-003478] p 1528 N95-22223

DIURNAL VARIATIONS
Analysis of mesospheric winds and waves
[AD-A279956] p 1414 N95-20591
Climatological data for clouds over the globe from surface observations, 1982-1991: The total cloud edition
[DE95-002537] p 1431 N95-22288

DIVERGENCE
Particle beam fusion
[DE95-000711] p 1549 N95-20075
Structure of ionic interfaces from an absolutely convergent solution of the Madelung problem
[DE94-019268] p 1573 N95-21474
Right inverse for the divergence operator in spaces of continuous piecewise polynomials
[PB95-127080] p 1496 N95-22369
Locking of the finite element method in thermoelasticity
[PB95-127098] p 1496 N95-22370

DIVERTERS
Recent DIII-D results
[DE94-017519] p 1549 N95-20038
Plasma shape experiments for an optimized tokamak
[DE94-017508] p 1553 N95-20445
Power balance in D3-D during single-null ELMing H-mode plasmas
[DE94-016680] p 1554 N95-20568
Experimental measurements and modeling of impurity transport in the divertor and boundary plasma of D3-D
[DE94-016519] p 1556 N95-21159
The ITER in-vessel system
[DE94-018053] p 1560 N95-21665

DIVING (UNDERWATER)
Solubilities of nitrogen and helium in water and blood at 37 C and pressures of up to 11 ATA
[AD-A286269] p 1446 N95-22003

DMSP SATELLITES
Location and characteristics of the reconnection X-line deduced from low-altitude satellite and radar observations
[NASA-TM-110114] p 1413 N95-20453

DOCUMENTATION
Ice Processing System software support documentation
[AD-A280030] p 1388 N95-20006
Program WALKMAN: A code designed to perform electron single collision elastic scattering Monte Carlo calculations
[DE94-017501] p 1511 N95-20444
A software process framework for the Software Engineering Institute's (SEI) capability maturity model
[AD-A286595] p 1462 N95-20765

DOMAIN WALL
Domain processes in ferroelectric ceramics
[AD-A279567] p 1276 N95-21697

DOMAINS
Multi-dimensional Petri nets
[PB95-127583] p 1491 N95-21024

DOMINANCE
Proof of a conjecture of Narayana on dominance refinements of the Smirnov two-sample test
[PB95-132650] p 1499 N95-21979

DOPED CRYSTALS
High precision trace neutron transmutation doping of detector-grade high resistance zone-refined silicon mono-crystal
[DE94-631463] p 1563 N95-19978
Scaling of solid state lasers for satellite power beaming applications
[DE94-016366] p 1368 N95-19986
Processing and characterization of Ni-Al-Fe-B shape-memory alloy wires produced by rapid solidification
[DE94-017702] p 1250 N95-20020
Carrier doping and interlayer coupling in HTSC single crystals
[DE94-018637] p 1564 N95-20127
Radiation effects on p+n InP junctions grown by MOCVD p 1319 N95-20520
Design of high-efficiency, radiation-hard, GaInP/GaAs solar cells p 1319 N95-20521
Photoluminescence under pressure and annealing of nitrogen-doped ZnSe
[DE95-002355] p 1568 N95-20630
Complementary GaAs junction-gated heterostructure field effect transistor fabrication for integrated circuits
[DE95-001522] p 1327 N95-20882
Photophysical processes on triplet states and radical ions in pure and molecularly doped polymers
[DE95-002681] p 1570 N95-20916
Conducting thermoset polymers
[AD-A286541] p 1273 N95-21014
Ultraviolet laser emission properties of Ce(3+)-doped LiSrAlF6
[DE94-016364] p 1372 N95-21135
X-ray studies of microstructures in semiconductor and superconducting materials
[DE95-001802] p 1572 N95-21279
Anodic oxygen-transfer electrocatalysis at iron-doped lead dioxide electrodes
[DE95-001653] p 1242 N95-21397
Light output and radiation damage in a YAlO3:Ce crystal
[DE94-016815] p 1545 N95-21643
InTlSb for long-wavelength infrared photodetectors and arrays
[AD-A280108] p 1332 N95-21774
Tunable CW blue, green, orange and red upconversion fiber lasers at room temperature
[DE95-000851] p 1375 N95-22007
The doping effect on spin-Peierls instability
[DE94-629046] p 1577 N95-22178
Quantum chemical study of rare gas/halide interactions as a model for high energy density material. 2: The interaction of hydrogen chloride with the rare gas xenon
[AD-A286385] p 1248 N95-22321

DOPPLER EFFECT
DAMSON: A system to measure multipath dispersion, Doppler spread and Doppler shift on multi-mechanism communications channels p 1299 N95-20955
Method and apparatus for classifying targets
[AD-D016519] p 1303 N95-21464

DOPPLER NAVIGATION
Orbit determination of highly elliptical Earth orbiters using improved Doppler data-processing modes
p 1218 N95-21533

DOPPLER RADAR
BACKSCAT lidar simulation version 4.0: Technical documentation and users guide
[AD-A285851] p 1290 N95-20376
Real-data tests of a single-Doppler radar assimilation system
[AD-A286638] p 1292 N95-20904
Radar studies of aviation hazards
[AD-A285845] p 1203 N95-21831
Frequency-coded monopulse MTI
[AD-D016495] p 1307 N95-21904

DOSAGE
Thorium-232 in human tissues: Metabolic parameters and radiation doses
[DE94-019275] p 1441 N95-20074
Superresolution direction finding algorithms for the characterisation of multi-moded HF signals
p 1299 N95-20958

DRAG
Low rotational drag in high-temperature superconducting bearings
[DE95-002983] p 1382 N95-22292

DRAG MEASUREMENT
Investigation of a thermal buoyancy effect on the drag of half models tested in the ARA Transonic Wind Tunnel
[ARA-MEMO-407] p 1199 N95-19946
Optical processing and control
[AD-A279157] p 1546 N95-21975

DRAG REDUCTION
Elastic micro-fabricated surface layer for reducing turbulence and drag on an object while it moves through a fluid medium
[AD-D016516] p 1356 N95-22060
Drag reduction strategies p 1361 N95-22453

DRIFT RATE
Radio-science performance analysis software
p 1305 N95-21540

DRILLING
VTT test borehole for bedrock investigations
[PB95-132965] p 1427 N95-22095

DRINKING
Hypervolemia in men from drinking hyperhydration fluids at rest and during exercise
[NASA-TM-4657] p 1439 N95-21544

DROP SIZE
A review of water mist technology for fire suppression
[AD-A285738] p 1202 N95-20071

DROP TESTS
Determination of layer moduli from falling weight deflectometer measurements
[PB95-129748] p 1286 N95-21333

DROPS (LIQUIDS)
Nonlinear spectroscopy of multicomponent droplets and two- and three-dimensional measurements in flames
[AD-A279945] p 1238 N95-20581

DROPSONDES
Resolving velocity profiles with the multi-scale profiler
[AD-A286446] p 1434 N95-21461

DROUGHT
Dust Bowl migration as an analog for possible global warming-induced migration from Mexico
[DE94-017472] p 1401 N95-20089
Monsoons: AMIP simulations of the 1987 and 1988 drought and flood regimes
[DE94-014789] p 1428 N95-20140

DRY FRICTION
On the origins and modeling of frictional behavior in interfacially-complex sliding contacts
[DE94-019129] p 1381 N95-21601

DRYING
Volatiles in the Earth: All shallow and all recycled
p 1416 N95-21779

DUALITY PRINCIPLE
Duality and equivalencies in closed tandem queueing networks
[PB95-132502] p 1482 N95-21271

DUCTED FLOW
Dual active surface heat flux gage probe
[NASA-TM-106861] p 1366 N95-21391

DUCTILE-BRITTLE TRANSITION
Ductile-brittle transition behavior of tungsten under shock loading
[DE94-009913] p 1251 N95-20122
Fracture behavior of the Fe-8Al alloy FAP-Y
[DE95-000956] p 1258 N95-21676

DUCTILITY
Processing and characterization of Ni-Al-Fe-B shape-memory alloy wires produced by rapid solidification
[DE94-017702] p 1250 N95-20020
Fabrication and properties of alumina matrix composites containing nickel aluminide reinforcements
[DE94-018703] p 1250 N95-20044
2nd International ADI seminar
[PB95-127734] p 1255 N95-21108
Fracture behavior of the Fe-8Al alloy FAP-Y
[DE95-000956] p 1258 N95-21676
The development of a super-alpha2 titanium aluminide alloy consolidated by rapid omnidirectional compaction
[AD-A279254] p 1260 N95-21986

DUCTS
Modelling and simulation of HF/VHF MMPPs
p 1293 N95-20925
Modeling tropospheric ducting effects on satellite-to-ground paths p 1295 N95-20936
Large-eddy simulation of separated flow in a ribbed duct p 1347 N95-21070
Direct simulation of turbulent flow in a square duct: Reynolds-stress budgets p 1348 N95-21073
MHD pressure drop in ducts with imperfectly insulating coatings
[DE95-002852] p 1558 N95-21244

DUPLEXERS
Design and modelling of a link monitoring mechanism for the Common Data Link (CDL)
[AD-A286167] p 1309 N95-22245

DURABILITY
The environmental durability of fiber reinforced ceramic matrix composites
[AD-A283750] p 1225 N95-19919
Final results of the advanced photovoltaic experiment
p 1321 N95-20528

The Materials Corrosion and Environmental Effects Laboratory (MCEL)
[DE94-018268] p 1254 N95-20816
Natural gas converter performance and durability
[PB95-135554] p 1284 N95-21966

DUST
The variation of the dust temperature within late-type spiral galaxies p 1593 N95-21766
HIRAS images of fossil dust shells around AGB stars p 1593 N95-21768
Response of the B-1B air data sensor to simulated dust cloud environments
[AD-A286134] p 1213 N95-22036

DYADICS
Classification of bianisotropic media
[PB95-127635] p 1502 N95-21102
Dyads: A generalisation of monads
[PB95-134052] p 1494 N95-21867

DYES
Sol-gel-derived silica films with tailored microstructures for applications requiring organic dyes
[DE94-018886] p 1264 N95-20047
Photodegradation and photophysics of laser dyes
[AD-A285105] p 1368 N95-20063

DYNAMIC CHARACTERISTICS
Connection with dynamics: General introduction
[NASA-CR-197617] p 1579 N95-19947
Transition-energy crossing with a gamma(sub t)(-)jump
[DE94-017315] p 1531 N95-20021
Comparison of the dynamic fatigue behavior of two monolithic SiC and an Al2O3/SiC composite
[DE94-017751] p 1225 N95-20022
Magnetron power supply at high stability and its application in plasma excitation for the production of ultraviolet radiation
[DE94-629656] p 1326 N95-20733
Time behavior and frequency response of the microwave propagation channel during multipath propagation p 1296 N95-20942
Quantum dynamical phenomena of independent electrons in semiconductor superlattices subject to a uniform electric field
[DE95-001655] p 1574 N95-21723
Critical dynamics and plastic flow in disordered Josephson junction arrays
[DE94-629074] p 1576 N95-21995
Determination of the complex elastic moduli of materials using a free-free bar technique
[AD-A279861] p 1281 N95-22387

DYNAMIC CONTROL
Generic architecture for knowledge-based control of processes in dynamic environments
[PB95-132676] p 1483 N95-21981

DYNAMIC MODELS
Development and enhancement of a model of performance and decision making under stress in a real life setting
[AD-A285945] p 1449 N95-20393
Mathematical modeling of a class of multibody flexible spacecraft structures
[NASA-TM-109166] p 1219 N95-20800
Computer based analysis and synthesis of retinal function
[AD-A286084] p 1443 N95-20811
Monthly mean sea ice data from the Polar Ice Prediction System, the Regional Polar Ice Prediction System-Barents Sea and the Regional Polar Ice Prediction System-Greenland Sea
[AD-A280095] p 1433 N95-21018
A Lagrangian dynamic subgrid-scale model turbulence p 1344 N95-21051
Developments and applications of dynamic models for large eddy simulation of complex flows p 1346 N95-21062
Subgrid scale models in finite difference simulations of complex wall bounded flows p 1346 N95-21063
Large-eddy simulation of rotating channel flows using a localized dynamic model p 1346 N95-21064
Comparison of DNS and LES of transitional and turbulent compressible flow: Flat plate and mixing layer p 1347 N95-21066
Rib vortices in round jets: Direct and large eddy simulation p 1351 N95-21088
The method of evaluating quantum partition function for the Hubbard model
[DE94-628991] p 1581 N95-21639
A dynamic localization model with stochastic backscatter p 1359 N95-22445
Large-eddy simulation of a plane wake p 1360 N95-22446
Local dynamic subgrid-scale models in channel flow p 1360 N95-22447
Large-eddy simulation of flow through a plane, asymmetric diffuser p 1360 N95-22449
Large-eddy simulation of a boundary layer with concave streamwise curvature p 1360 N95-22450

DYNAMIC PRESSURE
Pressure measurements on an F/A-18 twin vertical tail in buffeting flow. Volume 1: Wind tunnel test summary
[AD-A279126] p 1202 N95-21877

DYNAMIC PROGRAMMING
Optimal active control for Burgers equations p 1361 N95-22454

DYNAMIC RANGE
LLNL/Lion Precision LVDT amplifier
[DE95-001504] p 1327 N95-20854
Non-linear A/D converters for integrated silicon smart sensors
[PB94-208402] p 1330 N95-21590
A simple ocean bottom hydrophone with 200 megabyte data capacity
[AD-A279478] p 1434 N95-21677

DYNAMIC RESPONSE
Nonlinear dynamic fluid-structure interaction calculations with coupled finite element and finite volume programs
[DE94-016204] p 1339 N95-20166
Stabilization and control problems in structural dynamics
[AD-A279996] p 1340 N95-20312
Instantaneous frequency dynamics of coherent emission from magnetoexcitons in gallium arsenide
[DE94-018182] p 1569 N95-20677
Phase dynamics of non-equilibrium distributions of free electron-hole pairs in GaAs quantum wells
[DE94-018190] p 1569 N95-20679
Dynamic response of pressure measuring systems
[ARL-TR-32] p 1365 N95-20759
Modeling the effect of shroud contact and friction dampers on the mistuned response of turbopumps
[NASA-CR-197285] p 1379 N95-20795
On the influence of electromagnetic wave and relativistic electron beam on a plasma
[DE94-628962] p 1561 N95-21848
Effects of yaw and pitch motion on model attitude measurements
[NASA-TM-4641] p 1368 N95-22109
Wave journal bearing. Part 2: Experimental pressure measurements and fractional frequency whirl threshold for wave and plain journal bearings
[NASA-TM-106848-PT-2] p 1382 N95-22405
Simulation of structural response using a recurrent radial basis function network
[DE94-017342] p 1486 N95-22409

DYNAMIC STABILITY
The doping effect on spin-Peierls instability
[DE94-629046] p 1577 N95-22178

DYNAMIC STRUCTURAL ANALYSIS
Nonlinear dynamic fluid-structure interaction calculations with coupled finite element and finite volume programs
[DE94-016204] p 1339 N95-20166
Stabilization and control problems in structural dynamics
[AD-A279996] p 1340 N95-20312
Ultrafast magnetoexciton dynamics in GaAs
[DE94-018175] p 1514 N95-20732
Modeling the effect of shroud contact and friction dampers on the mistuned response of turbopumps
[NASA-CR-197285] p 1379 N95-20795
Mathematical modeling of a class of multibody flexible spacecraft structures
[NASA-TM-109166] p 1219 N95-20800
Vibration analysis of the AN/SPS-67(V)3 surface search radar
[AD-A286050] p 1302 N95-21324
Generic architecture for knowledge-based control of processes in dynamic environments
[PB95-132676] p 1483 N95-21981
Simulation of structural response using a recurrent radial basis function network
[DE94-017342] p 1486 N95-22409
Sandia National Laboratories analysis code data base
[DE95-004188] p 1502 N95-22420

DYNAMIC TESTS
Effect of atmospheric pressure on measured aircraft noise levels
[PB95-130423] p 1207 N95-21425
Fire smoke ventilation through shafts: Experiments
[PB95-132247] p 1288 N95-21978

DYNAMICAL SYSTEMS
Coupled analytic maps
[PB95-111076] p 1498 N95-19945
Analytic Perturbation Analysis of Discrete Event Dynamic Systems
[DE94-018635] p 1480 N95-20126
Semiquantum chaos and the large N expansion
[DE94-016196] p 1488 N95-20169
Invariant measures of interval maps
[PB95-107835] p 1389 N95-20207
Symmetry, Wigner functions and particle reactions
[DE94-629887] p 1514 N95-20735
Quantization in curvilinear coordinates
[DE94-770603] p 1514 N95-20737
Computation of invariant manifolds
[PB95-135687] p 1492 N95-21318

DYNAMICS
Molecular snapshots: Product imaging of dynamics important to fundamental combustion processes
[DE94-018595] p 1510 N95-20346

DYNAMO THEORY
Magnetic fluctuation induced transport and edge dynamo measurements in the MST reversed-field pinch
[DE95-000591] p 1549 N95-20114

DYNODES
Method of fabricating a microelectronic photomultiplier device with integrated circuitry
[AD-D016530] p 1325 N95-20726

DYSON THEORY
Theory of the excitonic lineshape in low-dimensional structures with rough interfaces
[DE95-003434] p 1582 N95-22237

DYSPROSIUM
The low temperature properties of (Dy(1-x)Er(x))Ni2 alloys
[DE95-001657] p 1260 N95-21923

E

E REGION
The relative importance of meteor burst and other distance polar cap propagation modes in the low VHF band p 1293 N95-20928

EAR PROTECTORS
Temporary threshold shifts produced by high intensity freefield impulse noise in humans wearing hearing protection
[AD-A286289] p 1454 N95-22045

EARTH (PLANET)
Erice International Seminars on Planetary Emergencies. 17th Workshop: The Collision of an Asteroid or Comet with the Earth
[AD-A280122] p 1600 N95-21577

EARTH ALBEDO
Meso-scale cooling effects of high albedo surfaces: Analysis of meteorological data from White Sands National Monument and White Sands Missile Range
[DE94-018535] p 1429 N95-20782
Detection optimization using linear systems analysis of a coded aperture laser sensor system
[DE95-001112] p 1371 N95-20832

EARTH ATMOSPHERE
Daytime Raman lidar profiling of atmospheric water vapor
[DE94-015747] p 1413 N95-20397
Space fundamentals for the war fighter
[AD-A279703] p 1217 N95-20690
Program control on the Tropical Rainfall Measuring Mission p 1584 N95-20750
Continuously-tunable, narrow-linewidth, Q-switched Cr:LiSAF laser for lidar applications
[DE95-000862] p 1373 N95-21312
NEO-LISP: Deflecting near-Earth objects using high average power, repetitively pulsed lasers
[DE95-000863] p 1599 N95-21367
Overview of remote sensing laser development and semiconductor laser technology
[DE94-019103] p 1389 N95-21552
Primitive Xe in the atmospheres of Earth and mars p 1419 N95-21795
Comets, impacts, and atmospheres p 1422 N95-21810
Implications of noble gases in a recently recognized Martian meteorite (ALH84001) for the degassing history of Mars p 1424 N95-21819

EARTH CRUST
Anatomy of the Midcontinent Rift beneath Lake Superior
[DE94-019298] p 1415 N95-21477
Rare gases systematics and mantle structure p 1416 N95-21778

EARTH IONOSPHERE
An overview of the Evaluation of Oxygen Interactions with Materials 3 Experiment: Space Shuttle Mission 46; July-August, 1992
[NASA-TM-110129] p 1412 N95-20278
Innovative use of DSP technology in space: FORTE event classifier
[DE94-016086] p 1291 N95-20697
Ion heating perpendicular to the magnetic field
[AD-A286635] p 1501 N95-20773
A simulation of plasma motion in the polar ionosphere
[AD-A286166] p 1426 N95-22019
The applicability of neural networks to ionospheric modeling in support of relocatable Over-the-Horizon radar
[AD-A286114] p 1309 N95-22230

EARTH MAGNETOSPHERE
Observations of cold magnetospheric ions at geosynchronous orbit during times of high activity
[DE95-000936] p 1600 N95-21935
Substorm theories: United they stand, divided they fall
[NASA-CR-197672] p 1427 N95-22326

EARTH MANTLE
Modeling the effect of water on mantle rheology
p 1417 N95-21783
Structure and stability of hydrous minerals at high pressure p 1417 N95-21786
Nitrogen isotopic components in the early solar system p 1420 N95-21800
Subduction and volatile recycling in Earth's mantle
p 1421 N95-21802
Alkali element depletion by core formation and vaporization on the early Earth p 1421 N95-21804
Hydrogen storage in Earth's mantle and core
p 1423 N95-21813
Water abundance and accretion history of terrestrial planets p 1424 N95-21820
The isotope geochemistry of abyssal peridotites and related rocks
[AD-A279435] p 1435 N95-21918
Source contributions at far-regional distances
[AD-A279405] p 1426 N95-21932

EARTH ORBITAL ENVIRONMENTS
Parasitic current collection by solar arrays in LEO
p 1321 N95-20527
Preliminary results from the flight of the Solar Array Module Plasma Interactions Experiment (SAMPIE)
p 1321 N95-20529
Post-flight investigation programmes of recently retrieved solar generators p 1321 N95-20531
Electrostatic noise in the plasma environment around the shuttle
[NASA-TM-106856] p 1415 N95-21188

EARTH ORBITAL RENDEZVOUS
STS 63 flight day 4 highlights/MIR-Shuttle rendezvous
[NASA-TM-110512] p 1219 N95-21113
STS 63: Post flight presentation
[NASA-TM-110514] p 1219 N95-21558

EARTH ORBITS
The design and analysis of a phased array microstrip antenna for a low earth orbit communication satellite
[AD-A284791] p 1289 N95-20065
Orbit determination of highly elliptical Earth orbiters using improved Doppler data-processing modes
p 1218 N95-21533

EARTH PLANETARY STRUCTURE
Statistical properties of geologic fractals
[DE94-019272] p 1414 N95-20908

EARTH SURFACE
Detection optimization using linear systems analysis of a coded aperture laser sensor system
[DE95-001112] p 1371 N95-20832
Classical analysis methods for designing and developing downlooking radars
[AD-A285760] p 1302 N95-21405
Remote-sensing based technique to account for sub-grid scale variability of land surface properties
[NASA-TM-110501] p 1390 N95-22110
Regional scale hydrology with a new land surface processes model
[NASA-TM-110500] p 1390 N95-22111

EARTHQUAKES
Infrasonic observations of the Northridge, California, earthquake
[DE94-018095] p 1413 N95-20289
The Novaya Zemlya Event of 31 December 1992 and Seismic Identification Issues: 15th Annual Seismic Research Symposium
[AD-A279847] p 1414 N95-20760
Thermochemistry of dense hydrous magnesium silicates p 1416 N95-21782
Source contributions at far-regional distances
[AD-A279405] p 1426 N95-21932

ECHELLE GRATINGS
Fabrication and testing of a silicon immersion grating for infrared spectroscopy
[DE94-017173] p 1237 N95-20386
An Echelle Grating Spectrometer (EGS) for mid-IR remote chemical detection
[DE94-019310] p 1367 N95-21478

ECOLOGY
Compilation of 1993 annual reports of the Navy ELF Communications System Ecological Monitoring Program. Volume 2: Tabs C-F
[AD-A279770] p 1308 N95-21988

ECONOMIC ANALYSIS
Patterns of financial change in the OECD area
[PB95-110979] p 1594 N95-19939
Assessment of liquefaction and pyrolysis systems
[PB95-129797] p 1236 N95-20290
Anaerobic digestion analysis model: User's manual
[DE94-011858] p 1437 N95-20471
An analysis of cost overruns on defense acquisition contracts p 1584 N95-20749
Highlights of recent balance of system research and evaluation
[DE95-001626] p 1393 N95-20863
Technical and economic evaluation of natural gas based synthesis gas production technologies
[PB95-130597] p 1242 N95-21426
Cost-effective ceramics program in the United States
[DE95-001425] p 1278 N95-21909
Economic feasibility analysis of distributed electric power generation based upon the natural gas-fired fuel cell
[DE94-012277] p 1396 N95-22033
Gas-phase photocatalytic oxidation: Cost comparison with other air pollution control technologies
[DE95-000241] p 1410 N95-22278

ECONOMIC DEVELOPMENT
Patterns of financial change in the OECD area
[PB95-110979] p 1594 N95-19939

ECONOMIC FACTORS
Beyond telecommuting: A new paradigm for the effect of telecommunications on travel
[DE95-001224] p 1289 N95-20214
Progress in the development of recycling processes for electric vehicle batteries
[DE94-015894] p 1324 N95-20626
NASA's attack on costs p 1585 N95-20755
Methods and opportunities in the recycling of rare Earth based materials
[DE95-001680] p 1259 N95-21737

ECONOMIC IMPACT
Dust Bowl migration as an analog for possible global warming-induced migration from Mexico
[DE94-017472] p 1401 N95-20089
Energy impacts of controlling carbon dioxide emissions from an integrated gasification/combined-cycle system
[DE94-016878] p 1403 N95-20478

ECONOMICS
Patterns of financial change in the OECD area
[PB95-110979] p 1594 N95-19939
Anaerobic digestion analysis model: User's manual
[DE94-011858] p 1437 N95-20471
Estimating the costs of human space exploration
p 1584 N95-20744
HPCC technology awareness program: Improved economic competitiveness through technology awareness, transfer and application
[DE95-002134] p 1476 N95-21355

ECOSYSTEMS
Definition report on environmental indices in future environmental assessments environmental balance/environmental outlook
[PB95-131876] p 1405 N95-21350
Long term changes on the continental shelf of the North Sea: Invertebrate trends, 1931-1990
[PB95-135224] p 1435 N95-21717
Aquatic plant control research program. Ecological assessment of Kirk Pond
[AD-A279090] p 1409 N95-21914
Proceedings: International Symposium on Global Change (IGBP)
[DE94-765351] p 1410 N95-22219

EDDY CURRENTS
Eddy current for detecting second-layer cracks under installed fasteners
[AD-A279871] p 1382 N95-20414
Flux-focusing eddy current probe and rotating probe method for flaw detection
[NASA-CASE-LAR-15231-1-SB] p 1383 N95-20764
Joule heating of the ITER TF cold structure: Effects of vertical control coil currents and ELMS
[DE95-001817] p 1560 N95-21724
Evaluation of scanners for C-scan imaging for nondestructive inspection of aircraft
[AD-A286398] p 1383 N95-22202

EDDY VISCOSITY
A numerical investigation of energy transfer and subgrid-scale eddy viscosity in homogeneous, isotropic and shear turbulence
[AD-A280005] p 1339 N95-20058
Comparison of DNS and LES of transitional and turbulent compressible flow: Flat plate and mixing layer
p 1347 N95-21066
Modelling anisotropy and backscatter effects in the subgrid scale stress tensor p 1349 N95-21077
Turbulence modeling for separated flow
p 1359 N95-22443
Large-eddy simulation of a plane wake
p 1360 N95-22446

EDGE DETECTION
Feature extraction without edge detection
[AD-A279842] p 1473 N95-22386
Saddle-node dynamics for edge detection
[DE94-017415] p 1473 N95-22426

EDGE DISLOCATIONS
Simulations of the dislocation array at Ge/Si interfaces
[DE94-017680] p 1565 N95-20244

EDGES
A new metallographic procedure for edge retention of enclosed surfaces
[DE94-017549] p 1261 N95-22048
Probability of detection for a GO CFAR radar processor using envelope detection approximation
[AD-A286211] p 1310 N95-22251

EDITING
ActorStudio reference manual. A user's guide to the ActorStudio user interface editor, version 1.0
[PB95-127023] p 1472 N95-22310

EDUCATION
Intelligent tutoring systems: Past, present, and future
[AD-A280011] p 1448 N95-19970
Using science centers to expose the general public to the microworld
[DE95-000647] p 1508 N95-20132
Hindered settling computations using a parallel boundary element method
[DE94-014286] p 1339 N95-20137
NASA/DOD Aerospace Knowledge Diffusion Research Project. Report 28: The technical communication practices of aerospace engineering and science students: Results of the phase 4 cross-national surveys
[NASA-TM-109123] p 1587 N95-20162
Training simulant for Halon 1211 portable extinguishers
[AD-A285403] p 1286 N95-20611
Software Capability Evaluation (SCE), version 2.0 team members guide
[AD-A286082] p 1462 N95-20809
Rate monotonic analysis for real-time systems: Instructors guide
[AD-A286083] p 1463 N95-20810
Microgravity: Teacher's guide with activities for physical science
[NASA-EG-103] p 1285 N95-21322
Development and evaluation of ALEC Micro-Wand 3e (tradename) training
[AD-A285863] p 1471 N95-22133

EFFECTIVE PERCEIVED NOISE LEVELS
Effect of atmospheric pressure on measured aircraft noise levels
[PB95-130423] p 1207 N95-21425
Active control of fan noise-feasibility study. Volume 1: Flyover system noise studies
[NASA-CR-195392-VOL-1] p 1505 N95-21888

EFFICIENCY
Calculation of near optimum design of InP/In(0.53)Ga(0.47)As monolithic tandem solar cells
p 1318 N95-20517
Qualification test results for blue-red reflecting solar covers p 1320 N95-20525
Evaluation of the technical performance of the Duttch National Air Quality Monitoring Network in 1992
[PB95-131892] p 1405 N95-21327
The efficiency calibration of the DSS-24 34-meter beam-waveguide antenna p 1305 N95-21542

EIGENVALUES
Matrix formulation of the particle motion in crystalline beams
[DE94-017301] p 1563 N95-19925
Graphs cospectral with distance-regular graphs
[PB95-111050] p 1488 N95-19943
A divide-and-conquer method for tridiagonalizing symmetric matrices with repeated eigenvalues
[DE95-002918] p 1476 N95-21257
NESTLE: Few-group neutron diffusion equation solver utilizing the nodal expansion method for eigenvalue, adjoint, fixed-source steady-state and transient problems
[DE95-001903] p 1466 N95-21288
Numerical wave speed for one-dimensional scalar hyperbolic conservation laws with source terms
[PB95-127536] p 1492 N95-21371
A new Krylov-subspace method for symmetric indefinite linear systems
[DE95-001826] p 1355 N95-21726
QMRPACK user's guide
[DE95-001770] p 1469 N95-21744
Discrete algebraic Riccati equation and linear matrix inequality
[PB95-133575] p 1484 N95-22139

EIGENVECTORS
Numerical wave speed for one-dimensional scalar hyperbolic conservation laws with source terms
[PB95-127536] p 1492 N95-21371

EL NINO
A study of westerly wind bursts preceding the 1991-1992 El Nino
[AD-A286570] p 1429 N95-20826

ELASTIC ANISOTROPY

Elastic anisotropy in hot-pressed Si3N4 composites: Role of in situ (beta)-Si3N4 grains and added (beta)-Si3N4 whiskers
[DE94-018387] p 1226 N95-20027

ELASTIC BODIES

A mixed time integration method for large scale acoustic fluid-structure interaction
[DE94-018327] p 1354 N95-21387

ELASTIC DEFORMATION

Time-dependent deformation of titanium metal matrix composites
[NASA-CR-195030] p 1230 N95-21363

ELASTIC PROPERTIES

Study of superconvergence by a computer-based approach: Superconvergence of the gradient of the displacement, the strain and stress in finite element solutions for plane elasticity
[AD-A279885] p 1490 N95-20588

Macromolecular and materials design using polyphosphazenes
[AD-A279781] p 1273 N95-20978

Mixed hp finite element methods for problems in elasticity and stokes flow
[PB95-104444] p 1341 N95-20981

Hydrogen and related materials at high density: Physics, chemistry and planetary implications
p 1418 N95-21791

Incology alloy 908 data handbook
[DE95-001818] p 1260 N95-22013

Determination of the complex elastic moduli of materials using a free-free bar technique
[AD-A279861] p 1281 N95-22387

ELASTIC SCATTERING

Program WALKMAN: A code designed to perform electron single collision elastic scattering Monte Carlo calculations
[DE94-017501] p 1511 N95-20444

Theories of the eta-meson-nucleus interaction
[DE94-016055] p 1516 N95-21125

Measurements of scattering processes in negative ion: Atom collisions
[DE95-000664] p 1519 N95-21276

Equilibrium and shot noise in mesoscopic systems
[DE95-000855] p 1576 N95-22008

ELASTIC WAVES

Experimental and theoretical evaluation of elastic waves in curved layered media
[AD-A286578] p 1504 N95-20918

ELASTODYNAMICS

A mixed time integration method for large scale acoustic fluid-structure interaction
[DE94-018327] p 1354 N95-21387

ELASTOMERS

Elastomeric electrical connector
[AD-D016559] p 1325 N95-20663

ELASTOPLASTICITY

Geomaterial models and numerical analysis of softening
[PB95-135380] p 1386 N95-21006

ELECTRIC ARCS

Preliminary results from the flight of the Solar Array Module Plasma Interactions Experiment (SAMPIE)
p 1321 N95-20529

ELECTRIC BATTERIES

Trimode Power Converter optimizes PV, diesel and battery energy sources
[DE94-015014] p 1313 N95-20262

Exploratory Technology Research Program for electrochemical energy storage
[DE95-002651] p 1392 N95-20439

Exploratory Technology Research Program for electrochemical energy storage
[DE95-002652] p 1394 N95-20915

Effects of battery technologies, driving patterns, and climate comfort control on the performance of electric vehicles
[DE95-001102] p 1329 N95-21296

Performance testing of the AC propulsion ELX electric vehicle
[DE95-002049] p 1330 N95-21471

Power systems for future missions. Appendices A-L
[NASA-CR-195320-APP-A-L] p 1395 N95-21530

Electric and Hybrid Vehicles Program
[DE95-001711] p 1332 N95-21738

Electric and Hybrid Vehicle Program Site Operator Program
[DE95-002042] p 1333 N95-21960

ELECTRIC CHARGE

Tests of dielectric model descriptions of chemical charge displacements in water
[DE94-007530] p 1236 N95-20277

Charge density of fractional charged quasiparticles in the composite fermion picture
[DE94-018122] p 1524 N95-21703

Full potential multiple scattering theory
[DE95-003197] p 1576 N95-22084

ELECTRIC CONDUCTORS

Accelerated screening methods for determining chemical and thermal stability of refrigerant-lubricant mixtures. Part 2: Experimental comparisons and verification of methods
[DE95-000743] p 1264 N95-20078

Characterization and electrical properties of copper films grown via direct liquid coinjection of (hfac)Cu(TMVS) and TMVS
[DE95-002957] p 1272 N95-20889

ELECTRIC CONNECTORS

The ROC optical connector p 1212 N95-20654

Elastomeric electrical connector
[AD-D016559] p 1325 N95-20663

ELECTRIC CONTACTS

Polycrystalline thin film cadmium telluride solar cells fabricated by electrodeposition
[DE94-011848] p 1391 N95-20118

Spectroscopic, morphological, and electrical characterization of PdGe ohmic contacts to n-GaAs
[DE95-000738] p 1329 N95-21394

Plasma-induced-damage of GaAs during etching of refractory metal contacts
[DE95-001525] p 1259 N95-21838

ELECTRIC CURRENT

Transport and dynamics in toroidal fusion systems
[DE94-018653] p 1548 N95-20029

Soft X-Ray Innovative Source Development Program
[AD-A286380] p 1551 N95-20232

Fiber-optic control of current filaments in high gain photoconductive semiconductor switches
[DE94-015804] p 1328 N95-21139

The evolution of configuration from q greater than 1 to q less than 1
[DE94-631396] p 1556 N95-21162

Geometric characterization of electromigration voids (A statistical analysis of electromigration voids)
[AD-A286494] p 1328 N95-21169

Acoustoelectric effect in semiconductor superlattice
[DE94-628994] p 1575 N95-21859

Method for determining the granular nature of superconductors using pulsed current
[AD-D016517] p 1577 N95-22137

Estimation of lightning stroke peak current as a function of peak electric field and the normalized amplitude of signal strength: Corrections and improvements
[DE94-016900] p 1335 N95-22189

ELECTRIC DIPOLES

A colocated magnetic loop, electric dipole array antenna (preliminary results)
[AD-A285381] p 1290 N95-20556

Low-frequency image theory for a current dipole in front of a permeable sphere
[PB95-127676] p 1300 N95-21104

Constraints on T-odd and P-even hadronic interactions from nucleon, nuclear, and atomic electric dipole moments
[DE94-012845] p 1526 N95-21920

Image theory for the unidirectionally conducting screen
[PB95-127031] p 1311 N95-22365

ELECTRIC DISCHARGES

Atomic velocity distributions in a hydrogen beam effusing out of an RF discharge dissociator
[AD-A279253] p 1307 N95-21985

ELECTRIC ENERGY STORAGE

Exploratory Technology Research Program for electrochemical energy storage
[DE95-002652] p 1394 N95-20915

ELECTRIC EQUIPMENT TESTS

Fault detection techniques for complex cable shield topologies
[AD-A286632] p 1291 N95-20771

ELECTRIC FIELDS

Physical Si(1-x)Ge(x)/Si heterojunction bipolar transistor model for device and circuit simulation
[PB95-110896] p 1312 N95-19934

The initiation of lightning and the growth of electric fields in thunderstorms
[AD-A280033] p 1428 N95-20008

A method for measuring the inductive electric field profile and noninductive current profiles on D3-D
[DE94-016683] p 1551 N95-20279

Extended theory of main ion and impurity rotation and bootstrap current in a shear layer
[DE94-015857] p 1555 N95-21141

The parametric dependence of the spatial structure of the radial electric field at the plasma edge in the D3-D tokamak
[DE94-016520] p 1556 N95-21163

Equivalent source current formulation in impedance tomography
[PB95-127627] p 1329 N95-21326

Investigation of spherical tearing mode
[NASA-CR-197284] p 1558 N95-21345

Cell membrane potentials induced during exposure to EMP fields
[DE94-018952] p 1439 N95-21548

Stellarator transport optimization with self-consistent electric fields
[DE94-019151] p 1559 N95-21581

Atomic processes in processing plasmas
[DE94-019177] p 1560 N95-21609

Role of dielectric constant in electrohydrodynamics of conducting fluids
[NASA-TM-110499] p 1331 N95-21614

Broadband pressure barrier for circular waveguide
[AD-D016503] p 1306 N95-21672

Quantum dynamical phenomena of independent electrons in semiconductor superlattices subject to a uniform electric field
[DE95-001655] p 1574 N95-21723

Improved broadband waveguide pressure window
[AD-D016487] p 1306 N95-21834

Acoustoelectric effect in semiconductor superlattice
[DE94-628994] p 1575 N95-21859

AC magnetic response of YBa2CuO7 with Y2BaCuO5 inclusions and of single-crystal YBa2Cu3O7: A comparative study
[PB94-207917] p 1577 N95-22166

Electric-field effects on shallow donor impurity in a harmonic quantum dot
[DE94-629034] p 1577 N95-22176

Estimation of lightning stroke peak current as a function of peak electric field and the normalized amplitude of signal strength: Corrections and improvements
[DE94-016900] p 1335 N95-22189

An analytical electron distribution function for inelastic collisions in a uniform gas with time varying electric field
[DE95-003476] p 1528 N95-22222

An analytical, inelastic, space and time dependent electron distribution for electrically excited gases
[DE95-003478] p 1528 N95-22223

Electro-optic effect in the PESO acousto-optic modulator
[AD-A286355] p 1548 N95-22255

Image solution for poisson's equation in wedge geometry
[PB95-127171] p 1310 N95-22311

Large-scale fields and flows in the magnetosphere-ionosphere system
[PB95-134664] p 1427 N95-22368

ELECTRIC GENERATORS

Trimode Power Converter optimizes PV, diesel and battery energy sources
[DE94-015014] p 1313 N95-20262

Feasibility study of power generation system with shape memory alloys
[DE95-714802] p 1254 N95-20890

Economic feasibility analysis of distributed electric power generation based upon the natural gas-fired fuel cell
[DE94-012277] p 1396 N95-22033

ELECTRIC HYBRID VEHICLES

Test and evaluation of electric vehicles
[DE95-001153] p 1313 N95-20213

Electric and Hybrid Vehicle Program: Site Operator Program
[DE95-001925] p 1332 N95-21731

Electric and Hybrid Vehicles Program
[DE95-001711] p 1332 N95-21738

ELECTRIC MOTOR VEHICLES

Test and evaluation of electric vehicles
[DE95-001153] p 1313 N95-20213

Brushless Doubly-Fed Machine system development program, phase 3
[DE94-013095] p 1315 N95-20380

Exploratory Technology Research Program for electrochemical energy storage
[DE95-002651] p 1392 N95-20439

Effects of battery technologies, driving patterns, and climate comfort control on the performance of electric vehicles
[DE95-001102] p 1329 N95-21296

Performance testing of the AC propulsion ELX electric vehicle
[DE95-002049] p 1330 N95-21471

Electric and Hybrid Vehicle Program: Site Operator Program
[DE95-001925] p 1332 N95-21731

Electric and Hybrid Vehicles Program
[DE95-001711] p 1332 N95-21738

EAGLES 1.1: A microcomputer software package for analyzing fuel efficiency of electric and gasoline vehicles
[DE95-001119] p 1469 N95-21829

Electric and Hybrid Vehicle Program Site Operator Program
[DE95-002042] p 1333 N95-21960

Demonstration of zinc/air fuel battery to enhance the range and mission of fleet electric vehicles: Preliminary results in the refueling of a multicell module
[DE95-004206] p 1337 N95-22421

ELECTRIC MOTORS
Design of power electronics for TVC and EMA systems
[NASA-CR-196540] p 1312 N95-19909
Brushless Doubly-Fed Machine system development program, phase 3
[DE94-013095] p 1315 N95-20380

ELECTRIC NETWORKS
Software for flow distribution in electronic rack structures
[AD-A285994] p 1325 N95-20715

ELECTRIC POTENTIAL
Physical Si(1-x)Ge(x)/Si heterojunction bipolar transistor model for device and circuit simulation
[PB95-110896] p 1312 N95-19934
Low electron beam energy CIVA analysis of passivated ICs
[DE94-017421] p 1314 N95-20286
Impedance characteristics of multistage ion diodes
[DE94-018887] p 1565 N95-20340
DC potential anomalies caused by a conducting body in an anisotropic conducting half-space
[PB95-127106] p 1291 N95-20775
Cell membrane potentials induced during exposure to EMP fields
[DE94-018952] p 1439 N95-21548
RF vacuum microelectronics based on thin film edge-emitter technology
[AD-A279539] p 1331 N95-21690
SEU and SEL response of the Westinghouse 64K E-2PROM, analog devices AD7876 12-bit ADC, and the Intel 82527 Serial Communications Controller
[DE95-003349] p 1334 N95-22086

ELECTRIC POWER
Magnetron power supply at high stability and its application in plasma excitation for the production of ultraviolet radiation
[DE94-629656] p 1326 N95-20733

ELECTRIC POWER SUPPLIES
Communications and control for electric power systems: Power system stability applications of artificial neural networks
[NASA-CR-197594] p 1483 N95-21613
Communications and control for electric power systems: Power system stability applications of artificial neural networks
[NASA-CR-197333] p 1484 N95-22171

ELECTRIC PROPULSION
BMDO photovoltaics program overview
p 1316 N95-20504

ELECTRIC PULSES
Method for determining the granular nature of superconductors using pulsed current
[AD-D016517] p 1577 N95-22137

ELECTRIC SPARKS
Effect of a solid insulator on the spark yield of S2F10 in SF6(*)
[DE95-001422] p 1326 N95-20791
Production of S2F10, S2OF10 and S2O2F10 by spark discharges in SF6*
[DE95-001421] p 1243 N95-21500

ELECTRIC TERMINALS
Elastomeric electrical connector
[AD-D016559] p 1325 N95-20663

ELECTRIC WIRE
Soft X-Ray Innovative Source Development Program
[AD-A286380] p 1551 N95-20232

ELECTRICAL FAULTS
Fault detection techniques for complex cable shield topologies
[AD-A286632] p 1291 N95-20771

ELECTRICAL GROUNDING
Analyses of grounded and ungrounded photovoltaic power systems
[DE94-015015] p 1391 N95-20263

ELECTRICAL IMPEDANCE
Derivation of coupling impedance from the wake potential of a finite bunch
[DE95-002529] p 1532 N95-20421
Xwake 1.0 user's manual
[DE95-002528] p 1463 N95-20901
Electrical impedance studies of acid-form NAFION membranes
[AD-A279271] p 1330 N95-21490
Broadband pressure barrier for circular waveguide
[AD-D016503] p 1306 N95-21672
Studies of the microwave resistivity of kappa-(BEDT-TTF)2Cu(N(CN)2)Cl
[DE95-002980] p 1262 N95-22291

ELECTRICAL INSULATION
Effect of a solid insulator on the spark yield of S2F10 in SF6(*)
[DE95-001422] p 1326 N95-20791
Measurement of the thermal properties of electrically conducting fluids using coated transient hot wires
[DE94-017816] p 1357 N95-22264

ELECTRICAL MEASUREMENT
Low electron beam energy CIVA analysis of passivated ICs
[DE94-017421] p 1314 N95-20286
Mechanism of the amperometric response of a proposed glucose sensor based on a polypyrrole-tubule-impregnated membrane
[AD-A279836] p 1365 N95-20431
Field-emitter arrays for RF vacuum microelectronics
[AD-A279959] p 1325 N95-20661
Electrical impedance studies of acid-form NAFION membranes
[AD-A279271] p 1330 N95-21490

ELECTRICAL PROPERTIES
Gate oxide shorts in nMOS transistors: Electrical properties and lifetime prediction method
[DE94-018904] p 1330 N95-21545
Growth and electrical and far-infrared properties of wide electron wells in semiconductors
[AD-A279409] p 1333 N95-21917
Defect classes: An overdue paradigm for CMOS IC testing
[DE94-018905] p 1334 N95-22118

ELECTRICAL RESISTANCE
Evaluation of Pd-Cr wires for strain gage application
[NASA-TM-106857] p 1366 N95-21259
Method for determining the granular nature of superconductors using pulsed current
[AD-D016517] p 1577 N95-22137
Surface technology programme
[PB95-132866] p 1262 N95-22174

ELECTRICAL RESISTIVITY
Properties of whisker-reinforced ceramics
[DE94-017759] p 1264 N95-20024
Power-law resistivity, magnetic relaxation and ac susceptibility
[DE94-016893] p 1501 N95-20241
Investigating the resolution of resistivity arrays using inverse theory
[DE94-017760] p 1412 N95-20287
Characterization and electrical properties of copper films grown via direct liquid coinjection of (hfac)Cu(TMVS) and TMVS
[DE95-002957] p 1272 N95-20889
Study of improved critical currents and mechanical properties in the Y-Ba-Cu-O superconductor with silver or Y2BaCuO3 or 211 dispersions
[AD-A285609] p 1502 N95-21194
Electrical impedance studies of acid-form NAFION membranes
[AD-A279271] p 1330 N95-21490
Structure and stability of hydrous minerals at high pressure p 1417 N95-21786
Breakdown of the law of large numbers in Josephson junction series arrays
[DE94-629075] p 1576 N95-21996
Order and turbulence in RF-driven Josephson junction series arrays
[DE94-629076] p 1576 N95-21997
On the conductance sum rule for the hierarchical edge states of the Fractional Quantum Hall Effect
[DE94-629030] p 1582 N95-22198
Measurement of the thermal properties of electrically conducting fluids using coated transient hot wires
[DE94-017816] p 1357 N95-22264
Development of practical high temperature superconducting wire for electric power applications
[DE94-017894] p 1336 N95-22271
Studies of the microwave resistivity of kappa-(BEDT-TTF)2Cu(N(CN)2)Cl
[DE95-002980] p 1262 N95-22291

ELECTRICITY
Modeling of high efficiency solar cells under laser pulse for power beaming applications p 1318 N95-20516
High efficiency GaP power conversion for Betavoltaic applications p 1323 N95-20540

ELECTRO-OPTICAL EFFECT
Frequency response measurements of integrated-optic electrodes
[DE94-016690] p 1542 N95-20403
Ultrafast optical studies of surface reaction processes at semiconductor interfaces
[DE95-001548] p 1574 N95-21839

ELECTRO-OPTICS
Sol-gel-derived silica films with tailored microstructures for applications requiring organic dyes
[DE94-018886] p 1264 N95-20047
Low temperature synthesis of semiconductor materials
[AD-A285120] p 1226 N95-20081
Program of the 1993 9th Interdisciplinary Laser Science Conference (ILS-9)
[AD-A285131] p 1369 N95-20082
Solid state research
[AD-A279662] p 1567 N95-20426
Development, fabrication, and metrology of the electro-optical breadboard model for the reflection grating array of the XMM grating spectrometer
[DE94-016605] p 1543 N95-20612
High contrast organic crystal optical modulator for phased array antenna and optical signal processing
[AD-A286557] p 1544 N95-20844
Development of ferroelectric liquid crystals with enhanced nonlinear optical properties
[AD-A279988] p 1571 N95-20965
Plasma Electrode Pockels Cells for the Beamlet and NIF lasers
[DE94-016541] p 1557 N95-21166
Heterostructure quantum confined Stark effect electrooptic modulators operating at 938 nm
[AD-A279342] p 1581 N95-21928
Characterization equipment for electrooptics and actuators
[AD-A286285] p 1546 N95-22043
Polycrystalline PLZT/ITO ceramic electro-optic phase gratings: Electro-optically reconfigurable difffractive devices for free-space and in-wafer interconnects
[AD-A285861] p 1547 N95-22076
Electro-optic effect in the PESO acousto-optic modulator
[AD-A286355] p 1548 N95-22255

ELECTROACOUSTICS
Acoustoelectric effect in semiconductor superlattice
[DE94-628994] p 1575 N95-21859

ELECTROCATALYSTS
Anodic oxygen-transfer electrocatalysis at iron-doped lead dioxide electrodes
[DE95-001653] p 1242 N95-21397

ELECTROCHEMICAL CELLS
Exploratory Technology Research Program for electrochemical energy storage
[DE95-002651] p 1392 N95-20439
Exploratory Technology Research Program for electrochemical energy storage
[DE95-002652] p 1394 N95-20915

ELECTROCHEMICAL CORROSION
A review of Microbially Induced Corrosion (MIC) of steel and a preliminary investigation to determine its occurrence in naval vessels
[MRL-GD-0048] p 1250 N95-19910
Simulations of metal dissolution and corrosion
[DE94-019295] p 1257 N95-21476
Corrosion resistance and behavior of construction materials exposed to dilute sulfuric acid at elevated temperatures under static conditions
[DE95-001723] p 1259 N95-21739
Corrosion resistance and behavioral characteristics of metals exposed to 70 percent by weight sulfuric acid at elevated temperatures
[DE95-001724] p 1259 N95-21740

ELECTROCHEMICAL OXIDATION
Mechanism of the amperometric response of a proposed glucose sensor based on a polypyrrole-tubule-impregnated membrane
[AD-A279836] p 1365 N95-20431
Anodic oxygen-transfer electrocatalysis at iron-doped lead dioxide electrodes
[DE95-001653] p 1242 N95-21397
Development and demonstration of advanced technologies for direct electrochemical oxidation of hydrocarbons (methanol, methane, propane)
[AD-A285094] p 1224 N95-22474

ELECTROCHEMISTRY
Chemical and electrochemical interactions on corroding metal surfaces
[DE95-000624] p 1250 N95-19979
Novel electrochemical materials prepared by sol-gel chemistry
[AD-A286310] p 1226 N95-20092
Chemically modified electrodes
[AD-A279821] p 1324 N95-20587
Electrochemical impedance pattern recognition for detection of hidden chemical corrosion on aircraft components
[AD-A285998] p 1239 N95-20716
Gordon Research Conference on Physical Electrochemistry
[AD-A286545] p 1240 N95-20842
Anodic oxygen-transfer electrocatalysis at iron-doped lead dioxide electrodes
[DE95-001653] p 1242 N95-21397
Quantum simulation of heterogeneous electron transfer free energies at the water-metal interface
[AD-A279279] p 1522 N95-21492

Surface x-ray scattering and scanning tunneling microscopy studies at the Au(111) electrode
[DE95-002409] p 1573 N95-21516

Surface second harmonic studies of Si(111)/electrolyte and Si(111)/SiO2/electrolyte interfaces
[AD-A279450] p 1245 N95-21826

Chemistry and electrochemistry in Lewis acid and superacid ionic liquids
[AD-A279396] p 1246 N95-21931

Application of optical second harmonic generation to surface analysis
[AD-A279445] p 1547 N95-22074

Development and demonstration of advanced technologies for direct electrochemical oxidation of hydrocarbons (methanol, methane, propane)
[AD-A285094] p 1224 N95-22474

ELECTRODES

Design and packaging aspects of microwave bandwidth lithium niobate modulators
[DE94-016602] p 1313 N95-20119

A charge distribution analysis instrument for catalysis and material science applications
[DE94-016489] p 1364 N95-20233

Enhanced ionic conduction at the film/substrate interface in LiI thin films grown on sapphire(0001)
[DE94-017884] p 1565 N95-20371

Frequency response measurements of integrated-optic electrodes
[DE94-016690] p 1542 N95-20403

Identification of resonant, two-electron, and inter-atomic features in K and L23 NEXAFS spectra
[AD-A285374] p 1513 N95-20554

Chemically modified electrodes
[AD-A279821] p 1324 N95-20597

Nickel hydroxide electrodes in reduced-alkalinity electrolytes
[DE95-002333] p 1326 N95-20814

Anodic oxygen-transfer electrocatalysis at iron-doped lead dioxide electrodes
[DE95-001653] p 1242 N95-21397

Surface x-ray scattering and scanning tunneling microscopy studies at the Au(111) electrode
[DE95-002409] p 1573 N95-21516

RF vacuum microelectronics based on thin film edge-emitter technology
[AD-A279539] p 1331 N95-21690

Surface second harmonic studies of Si(111)/electrolyte and Si(111)/SiO2/electrolyte interfaces
[AD-A279450] p 1245 N95-21826

Thoriated-tungsten, split-ring, hollow-cathode electrode for discharge devices
[AD-D016508] p 1333 N95-21906

ELECTRODIALYSIS

The application of electrodialysis to extend the lifetime of commercial electroplating baths
[DE95-000868] p 1246 N95-22012

ELECTROHYDRODYNAMICS

Role of dielectric constant in electrohydrodynamics of conducting fluids
[NASA-TM-110499] p 1331 N95-21614

ELECTROLYTES

Theoretical and experimental study of mixed solvent electrolytes
[DE94-017605] p 1237 N95-20384

Surface second harmonic studies of Si(111)/electrolyte and Si(111)/SiO2/electrolyte interfaces
[AD-A279450] p 1245 N95-21826

The application of electrodialysis to extend the lifetime of commercial electroplating baths
[DE95-000868] p 1246 N95-22012

Application of optical second harmonic generation to surface analysis
[AD-A279445] p 1547 N95-22074

ELECTROLYTIC CELLS

Inert gas purification and measuring oxygen partial pressure in gas mixtures with EMF method based on solid electrolyte cell
[PB95-127767] p 1240 N95-21110

ELECTROMAGNETIC ABSORPTION

Light output and radiation damage in a lead tungstate crystal
[DE94-016814] p 1565 N95-20265

Calculation of near optimum design of InP/In(0.53)Ga(0.47)As monolithic tandem solar cells
p 1318 N95-20517

MTX final report
[DE95-002960] p 1559 N95-21451

Time-resolved diagnostics of excimer laser-generated ablation plasmas used for pulsed laser deposition
[DE94-018950] p 1559 N95-21547

Light output and radiation damage in a YAlO3:Ce crystal
[DE94-016815] p 1545 N95-21643

Two-band model description of electroabsorption and third-harmonic generation in 1-D MX linear chains
[DE95-000932] p 1526 N95-21934

ELECTROMAGNETIC COMPATIBILITY

FASTPACK: Optimized solutions for modular avionics derived from a parametric study. Part 2: Avionics
p 1209 N95-20635

Composite cases for airborne electronic equipment: A technology study and EMC p 1212 N95-20655

Electromagnetic compatibility effects of advanced packaging configurations p 1213 N95-20658

ELECTROMAGNETIC FIELDS

Measurements of shielding effectiveness and cavity characteristics of airplanes
[PB94-210051] p 1289 N95-20191

Equivalent source current formulation in impedance tomography
[PB95-127627] p 1329 N95-21326

Three-dimensional effects for radio frequency antenna modeling
[DE94-019125] p 1303 N95-21459

Cell membrane potentials induced during exposure to EMP fields
[DE94-018952] p 1439 N95-21548

Compilation of 1993 annual reports of the Navy ELF Communications System Ecological Monitoring Program
[AD-A279575] p 1408 N95-21699

Compilation of 1993 annual reports of the Navy ELF Communications System Ecological Monitoring Program. Volume 2: Tabs C-F
[AD-A279770] p 1308 N95-21988

Topics in gauge theories and the unification of elementary particle interactions
[DE94-013485] p 1529 N95-22279

Radio-frequency techniques at the ISIS pulsed muon source
[PB95-129854] p 1529 N95-22303

Image theory for the unidirectionally conducting screen
[PB95-127031] p 1311 N95-22365

Low-level RF control for the AFEL
[DE94-018295] p 1540 N95-22410

ELECTROMAGNETIC INTERACTIONS

A theoretical study on the performance of the FDTD code on a massively parallel computer
[AD-A285346] p 1475 N95-20499

Nonperturbative aspects of the quark-photon vertex
[DE94-012846] p 1520 N95-21315

Investigation of direct photon production in 200 A GeV S + Au reactions
[DE94-018129] p 1525 N95-21704

ELECTROMAGNETIC INTERFERENCE

Measurements of shielding effectiveness and cavity characteristics of airplanes
[PB94-210051] p 1289 N95-20191

Electromagnetic interference testing and electrical subsystem: Non-communication
[AD-A286591] p 1292 N95-20858

ELECTROMAGNETIC MEASUREMENT

Measurements of shielding effectiveness and cavity characteristics of airplanes
[PB94-210051] p 1289 N95-20191

Flux-focusing eddy current probe and rotating probe method for flaw detection
[NASA-CASE-LAR-15231-1-SB] p 1383 N95-20764

ELECTROMAGNETIC NOISE

Noise model of the MSX SPIRIT 3 interferometer
[AD-A285837] p 1364 N95-20036

ELECTROMAGNETIC PROPULSION

Superconducting electromagnetic thruster
[AD-D016485] p 1355 N95-21902

ELECTROMAGNETIC PULSES

The GPS Burst Detector W-Sensor
[DE94-017406] p 1204 N95-20269

A wideband EMP test system
[DE94-015283] p 1290 N95-20474

Cell membrane potentials induced during exposure to EMP fields
[DE94-018952] p 1439 N95-21548

ELECTROMAGNETIC RADIATION

Electromagnetic radiation detector utilizing an electromagnetic radiation absorbing element in a mach-zehnder interferometer arrangement
[AD-D016507] p 1306 N95-21835

Electromagnetic waves in an ultrarelativistically hot and strongly magnetized electron-positron plasma
[DE94-628963] p 1307 N95-21849

On the theory of strong electromagnetic waves propagation in an electron-positron-ion plasma
[DE94-628964] p 1561 N95-21850

Large amplitude localized structures in a relativistic electron-positron ion plasma
[DE94-628965] p 1561 N95-21851

Compilation of 1993 annual reports of the Navy ELF Communications System Ecological Monitoring Program. Volume 2: Tabs C-F
[AD-A279770] p 1308 N95-21988

Optical radiation: Health based exposure limits for electromagnetic radiation in the wavelength range from 100 nanometer to 1 millimeter
[PB95-132767] p 1447 N95-22083

Localization phenomenon in some random classical systems
[AD-A286514] p 1309 N95-22215

ELECTROMAGNETIC SCATTERING

Diffraction computation by means of the method of equivalent currents
[AD-A285347] p 1291 N95-20692

Inverse and control problems in electromagnetics
[AD-A286438] p 1310 N95-22250

ELECTROMAGNETIC SHIELDING

Measurements of shielding effectiveness and cavity characteristics of airplanes
[PB94-210051] p 1289 N95-20191

Composite cases for airborne electronic equipment: A technology study and EMC p 1212 N95-20655

Lightweight electronic enclosures using composite materials p 1213 N95-20656

Fault detection techniques for complex cable shield topologies
[AD-A286632] p 1291 N95-20771

TIM-SCT cable testing protocol
[AD-A286633] p 1207 N95-20772

ELECTROMAGNETIC WAVE TRANSMISSION

Measurements of shielding effectiveness and cavity characteristics of airplanes
[PB94-210051] p 1289 N95-20191

A theoretical study on the performance of the FDTD code on a massively parallel computer
[AD-A285346] p 1475 N95-20499

Applications of wavelets to radar, imaging and related problems
[AD-A279909] p 1290 N95-20545

The Lorentz reciprocity theorem as a consistency test for propagation models p 1295 N95-20937

Temporal and spatial comportment of multiple paths in ionospheric propagation in oblique incidence: Fractal measures of perturbations p 1298 N95-20954

Improved broadband waveguide pressure window
[AD-D016487] p 1306 N95-21834

ELECTROMAGNETISM

DC potential anomalies caused by a conducting body in an anisotropic conducting half-space
[PB95-127106] p 1291 N95-20775

Classification of bianisotropic media
[PB95-127635] p 1502 N95-21102

Magnetoelectric properties of reciprocal bianisotropic materials with focus on the polarizability of chiro-omega spheres
[PB95-127650] p 1544 N95-21103

Low-frequency image theory for a current dipole in front of a permeable sphere
[PB95-127676] p 1300 N95-21104

Applied mathematical problems in modern electromagnetics
[AD-A286448] p 1303 N95-21462

Massively-parallel computational fluid dynamics
[AD-A279389] p 1355 N95-21942

Inverse and control problems in electromagnetics
[AD-A286438] p 1310 N95-22250

Dielectric mixtures with arbitrarily anisotropic components: Focus on special gyrotropic effects
[PB95-127015] p 1311 N95-22363

Image theory for the unidirectionally conducting screen
[PB95-127031] p 1311 N95-22365

ELECTROMAGNETS

Compact free electron lasers for medical applications
[AD-A285739] p 1369 N95-20072

ELECTROMECHANICAL DEVICES

Design of power electronics for TVC and EMA systems
[NASA-CR-196540] p 1312 N95-19909

Characterization equipment for electrooptics and actuators
[AD-A286285] p 1546 N95-22043

ELECTROMECHANICS

High density monolithic packaging technology for digital/microwave avionics p 1211 N95-20646

ELECTROMIGRATION

Methodology for ESCA analysis of electromigration
[AD-A286229] p 1241 N95-21168

Geometric characterization of electromigration voids (A statistical analysis of electromigration voids)
[AD-A286494] p 1328 N95-21169

Spectroscopic assessment of the reliability of metal/metal oxide interfaces
[AD-A286131] p 1261 N95-22035

ELECTROMYOGRAPHY

Analysis of musculo-skeletal loading using electromyography and biomechanical modelling
[PB95-135828] p 1444 N95-21007

ELECTRON ACCELERATORS
Theoretical and experimental studies of a novel accelerating structure
[AD-A283730] p 1531 N95-19974
Photocathodes for free electron lasers
[DE94-018305] p 1376 N95-22242
Very high-power electron-beam transport in long gas cells from 10(exp -3) to 10(exp 3) Torr N2
[DE95-002611] p 1539 N95-22306
Low-level RF control for the AFEL
[DE94-018295] p 1540 N95-22410

ELECTRON ATTACHMENT
Electron attachment to excited molecules
[DE94-019124] p 1522 N95-21519

ELECTRON BEAMS
Theoretical and experimental studies of a novel accelerating structure
[AD-A283730] p 1531 N95-19974
Charged particle dynamics in the acceleration gap of the PBFA 2 ion diode
[DE94-017347] p 1506 N95-20026
Low electron beam energy CIVA analysis of passivated ICs
[DE94-017421] p 1314 N95-20286
Studies of longitudinal instability with an electron beam
[DE94-018646] p 1532 N95-20347
High precision Woelter optic calibration facility
[DE94-016973] p 1542 N95-20364
Inverse Cerenkov laser acceleration experiment at ATF
[DE94-017990] p 1370 N95-20572
A URI program for Ultraviolet/extreme ultraviolet research
[AD-A279159] p 1370 N95-20600
On FEL integral equation and electron energy loss in intermediate gain regime
[DE94-770631] p 1371 N95-20757
A neutron beam polarizer for study of parity violation in neutron-nucleus interactions
[DE95-002743] p 1519 N95-21237
First results from the final focus test beam
[DE95-002897] p 1535 N95-21255
Coaxial hybrid wiggler
[AD-D016501] p 1331 N95-21671
Performance of cesium telluride photocathodes as an electron source for the Los Alamos FEL
[DE94-018302] p 1375 N95-21919
A 500 MW annular beam relativistic klystron
[DE95-000867] p 1334 N95-22011
Recent progress of the compact AFEL at Los Alamos
[DE95-002728] p 1376 N95-22154
Design, fabrication, and characterization of reflective diffractive optical elements in Si for free-space optical interconnects
[AD-A286416] p 1547 N95-22205
Experimental study of interactions of highly charged ions with atoms at keV energies
[DE94-018648] p 1529 N95-22316
Low emittance lattices for electron storage rings revisited
[DE94-017302] p 1540 N95-22391

ELECTRON BUNCHING
Derivation of coupling impedance from the wake potential of a finite bunch
[DE95-002529] p 1532 N95-20421
Emittance growth due to negative-mass instability above transition
[DE95-002527] p 1534 N95-20900

ELECTRON CAPTURE
Experimental investigations of electron capture from atomic hydrogen and deuterium by alpha particles
[DE95-002138] p 1523 N95-21587

ELECTRON CYCLOTRON HEATING
Simulation of tearing mode stabilization by using ECH
[DE94-770700] p 1554 N95-20684
MTX final report
[DE95-002960] p 1559 N95-21451

ELECTRON DENSITY (CONCENTRATION)
The Modified Embedded Atom Method
[DE94-015746] p 1564 N95-20142
Global ionospheric weather
[AD-A285520] p 1430 N95-21177
Variability of total electron content in the high-altitude ionosphere following solar maximum
[AD-A285849] p 1425 N95-21833
A simulation of plasma motion in the polar ionosphere
[AD-A286166] p 1426 N95-22019

ELECTRON DIFFRACTION
Correlations between surface structure and catalytic activity/selectivity
[DE94-019023] p 1234 N95-20052
Spin-specific photoelectron diffraction using magnetic x ray circular dichroism
[DE94-017527] p 1567 N95-20448
A structural determination using magnetic x ray circular dichroism in spin-polarized photoelectron diffraction
[DE94-017528] p 1567 N95-20449

ELECTRON DISTRIBUTION
An analytical electron distribution function for inelastic collisions in a uniform gas with time varying electric field
[DE95-003476] p 1528 N95-22222

ELECTRON EMISSION
Electron propagator theory and application
[AD-A279761] p 1507 N95-20097
Semiconductor cold electron emission device
[AD-D016577] p 1314 N95-20298
The in situ observation of epitaxial diamond thin film nucleation and growth using emission electron microscopy
[AD-A279811] p 1569 N95-20807
Emittance growth due to negative-mass instability above transition
[DE95-002527] p 1534 N95-20900

ELECTRON ENERGY
Correlations between surface structure and catalytic activity/selectivity
[DE94-019023] p 1234 N95-20052
Hybrid model in general geometry
[DE95-002614] p 1553 N95-20437
Location and characteristics of the reconnection X-line deduced from low-altitude satellite and radar observations
[NASA-TM-110114] p 1413 N95-20453
Atomic-resolution characterization of interface structure and chemistry in the STEM
[DE94-017753] p 1567 N95-20492
Enhanced scrape-off layer plasma in D3-D double-null discharges
[DE94-017977] p 1554 N95-20571
On FEL integral equation and electron energy loss in intermediate gain regime
[DE94-770631] p 1371 N95-20757
An advanced ECR ion source with a large uniformly distributed ECR plasma volume for multiply charged ion beam generation
[DE95-001078] p 1515 N95-20911
Heavy ion track-structure calculations for radial dose in arbitrary materials
[NASA-TP-3497] p 1517 N95-21191
Measurements of the Auburn ECE optical system parameters for temperature fluctuation measurements on TEXT-U
[DE94-019217] p 1562 N95-22120
An analytical, inelastic, space and time dependent electron distribution for electrically excited gases
[DE95-003478] p 1528 N95-22223

ELECTRON FLUX DENSITY
Low electron beam energy CIVA analysis of passivated ICs
[DE94-017421] p 1314 N95-20286

ELECTRON GUNS
Photoelectrons beam measurement from a magnesium cathode in a RF electron gun
[DE94-017994] p 1533 N95-20573

ELECTRON IMPACT
Electron-impact ionization of multicharged ions at ORNL: 1985-1992
[DE94-017318] p 1507 N95-20086
Theoretical atomic physics for fusion
[DE94-019196] p 1524 N95-21605

ELECTRON IRRADIATION
Electron-irradiated two-terminal, monolithic InP/Ga0.47In0.53As tandem solar cells and annealing of radiation damage p 1319 N95-20519

ELECTRON MICROSCOPES
A low temperature, ultrahigh vacuum, microwave-frequency-compatible scanning tunneling microscope
[AD-A279869] p 1365 N95-20413
Small cavity nonresonant tunable microwave-frequency alternating current scanning tunneling microscope
[AD-A285752] p 1328 N95-21218

ELECTRON MICROSCOPY
Effect of heat treatment temperature on creep-rupture properties of Fe3Al-based alloys
[DE94-017904] p 1253 N95-20375
The in situ observation of epitaxial diamond thin film nucleation and growth using emission electron microscopy
[AD-A279811] p 1569 N95-20807
Evaluation of dried storage of platelets for transfusion: Physiologic integrity and hemostatic functionality
[AD-A286078] p 1443 N95-20850
Parallel nanometer scale fabrication
[DE95-002122] p 1336 N95-22284

ELECTRON MOBILITY
Electron propagator theory and application
[AD-A279761] p 1507 N95-20097
Heavy ion track-structure calculations for radial dose in arbitrary materials
[NASA-TP-3497] p 1517 N95-21191
Quantum dynamical phenomena of independent electrons in semiconductor superlattices subject to a uniform electric field
[DE95-001655] p 1574 N95-21723

ELECTRON ORBITALS
Atomic orbital basis sets for molecular interactions
[AD-A279609] p 1506 N95-19959
Excess energy and structural dependence of the rate of energy redistribution during the photodissociation of iodotoluenes
[AD-A279997] p 1241 N95-21124

ELECTRON PARAMAGNETIC RESONANCE
Conducting thermoset polymers
[AD-A286541] p 1273 N95-21014
Modeling of nonlinear optic and ESR response of CDW MX materials
[DE94-018301] p 1578 N95-22297

ELECTRON PHONON INTERACTIONS
Pairing on small clusters in the Peierls-Hubbard model: Implications for C60
[DE94-016284] p 1565 N95-20330
Effect of the electron-SO-phonon on the impurity state energies in a semiconductor quantum well
[DE94-628993] p 1581 N95-21887
Temperature dependence of magnetopolarons in a parabolic quantum dot in arbitrary magnetic fields
[DE94-629033] p 1528 N95-22218

ELECTRON PLASMA
Experimental investigation of molecular beam injection in HL-1 tokamak
[DE94-631456] p 1556 N95-21165

ELECTRON PROBES
Phase E in a water-saturated peridotite system at 9.3 GPa p 1420 N95-21799

ELECTRON SCATTERING
Convergent Close-Coupling method for calculation of electron scattering on hydrogen-like targets
[DE94-631340] p 1508 N95-20196
Calculation of electron scattering on the He(+) ion
[DE94-631343] p 1509 N95-20199
Program WALKMAN: A code designed to perform electron single collision elastic scattering Monte Carlo calculations
[DE94-017501] p 1511 N95-20444
Nonperturbative aspects of the quark-photon vertex
[DE94-012846] p 1520 N95-21315
Exclusive processes: Tests of coherent QCD phenomena and nucleon substructure at CEBAF
[DE95-002892] p 1520 N95-21336
Recent photoabsorption measurements in the rare gases and alkalis in the 3 to 15 keV photon energy region
[DE94-019278] p 1521 N95-21406
Theoretical atomic physics for fusion
[DE94-019196] p 1524 N95-21605
Strong interactions studies with medium energy probes
[DE95-001800] p 1245 N95-21745
Nuclear research with the electromagnetic probe
[DE95-001812] p 1525 N95-21747
Submicrosecond, synchronizable x-ray source
[AD-D016497] p 1546 N95-21905
An analytical, inelastic, space and time dependent electron distribution for electrically excited gases
[DE95-003478] p 1528 N95-22223
The two-electron problem and prospects for atomic collision theory on a numerical lattice
[DE94-017856] p 1528 N95-22265

ELECTRON SOURCES
RF vacuum microelectronics based on thin film edge-emitter technology
[AD-A279539] p 1331 N95-21690
Performance of cesium telluride photocathodes as an electron source for the Los Alamos FEL
[DE94-018302] p 1375 N95-21919
Photocathodes for free electron lasers
[DE94-018305] p 1376 N95-22242
Fabrication and characterization of cesium telluride photocathodes: A promising electron source for the Los Alamos Advanced FEL
[DE94-018303] p 1377 N95-22348

ELECTRON SPECTROSCOPY
Optical properties of silicon clusters deposited on the basal plane of graphite
[DE94-017529] p 1542 N95-20450
Angle resolved Auger electron spectroscopy: An alternate tool for identifying electronic excitation processes in solids
[AD-A285375] p 1238 N95-20555
Methodology for ESCA analysis of electromigration
[AD-A286229] p 1241 N95-21168

Heavy ion track-structure calculations for radial dose in arbitrary materials
[NASA-TP-3497] p 1517 N95-21191
Micromachined silicon-based analytical microinstruments for space science and planetary exploration
[DE94-019306] p 1367 N95-21507

ELECTRON SPIN
Modeling of nonlinear optic and ESR response of CDW MX materials
[DE94-018301] p 1578 N95-22297

ELECTRON STATES
The electronic properties of polysilanes
[DE94-006464] p 1265 N95-20121
Quantum chemical study of rare gas/halide interactions as a model for high energy density material. 1: Transition properties in HCl
[AD-A285988] p 1239 N95-20613
Study of small carbon and semiconductor clusters using negative ion threshold photodetachment spectroscopy
[DE95-002327] p 1515 N95-20872
Excess energy and structural dependence of the rate of energy redistribution during the photodissociation of iodotoluenes
[AD-A279997] p 1241 N95-21124
Cluster reactions: An approach to understanding the fundamentals of heterogeneous catalysis
[DE95-002947] p 1243 N95-21447

ELECTRON TRANSFER
Solid-state dynamics and quantum transport in novel semiconductor nanostructures
[AD-A285946] p 1315 N95-20394
Gordon Research Conference on Physical Electrochemistry
[AD-A286545] p 1240 N95-20842
Quantum simulation of heterogeneous electron transfer free energies at the water-metal interface
[AD-A279279] p 1522 N95-21492
Equilibrium and shot noise in mesoscopic systems
[DE95-000855] p 1576 N95-22008
Magnetic interactions in the Emery model
[DE94-629059] p 1577 N95-22181
Resonant charge transfer in hyperthermal atomic and molecular ion-surface collisions
[AD-A284937] p 1530 N95-22471

ELECTRON TRANSITIONS
Quantum chemical study of rare gas/halide interactions as a model for high energy density material. 1: Transition properties in HCl
[AD-A285988] p 1239 N95-20613
Electronic structure and relative stability of icosahedral superatoms in Al-transition-metal alloys
[DE94-628996] p 1260 N95-21855
The solar flux of thermal neutrinos and antineutrinos of all flavors
[DE95-003204] p 1604 N95-22085
Electric-field effects on shallow donor impurity in a harmonic quantum dot
[DE94-629034] p 1577 N95-22176
Quantum chemical study of rare gas/halide interactions as a model for high energy density material. 2: The interaction of hydrogen chloride with the rare gas xenon
[AD-A286385] p 1248 N95-22321

ELECTRON TUNNELING
A low temperature, ultrahigh vacuum, microwave-frequency-compatible scanning tunneling microscope
[AD-A279869] p 1365 N95-20413
Electron tunneling magnetic field sensor
[AD-D016227] p 1365 N95-21117
Linear and nonlinear spectroscopy with the tunable AC scanning tunneling microscope
[AD-A285751] p 1241 N95-21217
Tunneling of self-trapped states and formation of a band
[DE94-629001] p 1582 N95-22378

ELECTRON-ION RECOMBINATION
Recombination, ion-molecule collisions and (laser assisted) electron-excited atom collisions
[AD-A285604] p 1517 N95-21216

ELECTRON-POSITRON PAIRS
Complementarity of e(+)e(-) and pp colliders for the exploration of electroweak symmetry breaking
[DE94-017397] p 1507 N95-20034
Electron-positron pair production in ultrarelativistic atomic collisions: 6.4 TeV S(sup 16+) with Au, Pd and Al
[DE95-000690] p 1508 N95-20133
Universality of particle multiplicities
[DE95-000727] p 1515 N95-20879

ELECTRON-POSITRON PLASMAS
Electromagnetic waves in an ultrarelativistically hot and strongly magnetized electron-positron plasma
[DE94-628963] p 1307 N95-21849
On the theory of strong electromagnetic waves propagation in an electron-positron-ion plasma
[DE94-628964] p 1561 N95-21850
Large amplitude localized structures in a relativistic electron-positron ion plasma
[DE94-628965] p 1561 N95-21851

ELECTRONIC COUNTERMEASURES
Directive optimization of coherent sidelobe canceller systems
[AD-D016513] p 1307 N95-21908

ELECTRONIC EQUIPMENT
Acoustic emission: The first half century
[DE94-017176] p 1503 N95-20267
Composite cases for airborne electronic equipment: A technology study and EMC p 1212 N95-20655
Lightweight electronic enclosures using composite materials p 1213 N95-20656
Elastomeric electrical connector
[AD-D016559] p 1325 N95-20663
Electromagnetic interference testing and electrical subsystem: Non-communication
[AD-A286591] p 1292 N95-20858
Study on the reaction kinetics in pulsed RF discharges under RIE conditions
[PB95-107868] p 1300 N95-21029

ELECTRONIC EQUIPMENT TESTS
Electromagnetic interference testing and electrical subsystem: Non-communication
[AD-A286591] p 1292 N95-20858
Assessment of a non-dedicated GPS receiver system for precise airborne attitude determination
[DE94-019309] p 1205 N95-21520
New concepts for refrigerant leak detection and mixture measurement
[DE94-018967] p 1287 N95-21559
The determination of static and time varying dipole source. Sensor geometry during sea trials using differential global positioning system
[MRL-TN-631] p 1205 N95-21642
Underwater Acoustic Generator Phase 2: Sea trial, March 1992
[MRL-TN-640] p 1434 N95-21657
Multi-port tester interface
[AD-D016240] p 1332 N95-21775
Thermal fixture for testing an integrated circuit
[AD-D016483] p 1333 N95-21900
Surfaces and thin films studied by picosecond ultrasonics
[DE95-001866] p 1506 N95-22071
Radiation tests on service electronics for future multi TeV detectors
[DE94-632822] p 1335 N95-22184
The Large Area Pulsed Solar Simulator (LAPSS)
[NASA-CR-197339] p 1397 N95-22336

ELECTRONIC MODULES
Materials research for GHz multi-chip modules
[AD-A279661] p 1227 N95-20412
MCMs for avionics: Technology selection and intermodule interconnection p 1210 N95-20641
Advanced Standard Electronic Modules format-E (SEM-E) processes for rapid prototyping
p 1210 N95-20642
Liquid flow-through cooling of electronic modules
p 1211 N95-20647
Immersion/two phase cooling p 1211 N95-20648
Consortia for Known Good Die (KGD), phase 1
[AD-A279407] p 1383 N95-21933
Uninterrupted, enhanced-rate event sequencer with mixed-speed counter modules
[AD-D016255] p 1334 N95-22030

ELECTRONIC PACKAGING
Design and packaging aspects of microwave bandwidth lithium niobate modulators
[DE94-016602] p 1313 N95-20119
A new mini Ball Grid Array (mBGA) multichip module technology
[DE94-018897] p 1480 N95-20342
High density monolithic packaging technology for digital/microwave avionics p 1211 N95-20646
Liquid flow-through cooling of electronic modules
p 1211 N95-20647
Electromagnetic compatibility effects of advanced packaging configurations p 1213 N95-20658

ELECTRONIC WARFARE
Overview of data fusion work for land electronic warfare
[AD-A279829] p 1301 N95-21292
Systems engineering design and technical analyses for Strategic Avionics Crew-station Design Evaluation Facility (SACDEF)
[AD-A286239] p 1213 N95-22024

ELECTRONS
A model for electron nuclear dynamics of a monatomic chain
[AD-A279652] p 1506 N95-19960
Quantization in curvilinear coordinates
[DE94-770603] p 1514 N95-20737
Electron-nuclear dynamics of molecular systems
[AD-A279649] p 1516 N95-21120
Measuring A(sub b) with polarized beams at SLC
[DE95-002865] p 1519 N95-21248
Luminosity polarization correlation in the SLC
[DE95-002889] p 1536 N95-21335
Photoemission and ferromagnetism
[DE95-002419] p 1520 N95-21362
On the Aharonov-Bohm effect with neutrons
[DE95-002985] p 1521 N95-21454
New shower maximum trigger for electrons and photons at CDF
[DE95-000563] p 1522 N95-21499
Gate oxide shorts in nMOS transistors: Electrical properties and lifetime prediction method
[DE94-018904] p 1330 N95-21545
Quantum dynamical phenomena of independent electrons in semiconductor superlattices subject to a uniform electric field
[DE95-001655] p 1574 N95-21723
Acoustoelectric effect in semiconductor superlattice
[DE94-628994] p 1575 N95-21859
Growth and electrical and far-infrared properties of wide electron wells in semiconductors
[AD-A279409] p 1333 N95-21917
Classical-quantum correspondence for ionization in fast ion-atom collisions
[DE95-000953] p 1526 N95-21940
Tunneling of self-trapped states and formation of a band
[DE94-629001] p 1582 N95-22378

ELECTROPHORESIS
Novel absorption detection techniques for capillary electrophoresis
[DE95-001673] p 1242 N95-21400
Separation of proteins by convective electrophoresis through a porous membrane
[PB95-127130] p 1248 N95-22373

ELECTROPHYSIOLOGY
A physiological neural network for saccadic eye movement control
[AD-A279599] p 1441 N95-20301
Computer based analysis and synthesis of retinal function
[AD-A286084] p 1443 N95-20811

ELECTROPLATING
The application of electrodialysis to extend the lifetime of commercial electroplating baths
[DE95-000868] p 1246 N95-22012

ELECTROPOLISHING
A new universal solution for the electrofinishing of metallic materials
[DE95-001681] p 1258 N95-21568

ELECTRORHEOLOGICAL FLUIDS
Proceedings of the 4th International Conference on Electrorheological Fluids
[AD-A286341] p 1266 N95-20227
Electrorheology for smart automotive suspensions
[AD-A285543] p 1380 N95-21157

ELECTROSLAG REFINING
Theoretical-experimental study on the electroslag remelting technology of high quality steels
[DE94-629216] p 1256 N95-21270

ELECTROSTATIC PROBES
A portable and independent edge fluctuation diagnostic
[DE94-018254] p 1554 N95-20681
Electrostatic noise in the plasma environment around the shuttle
[NASA-TM-106856] p 1415 N95-21188

ELECTROSTATICS
Tests of dielectric model descriptions of chemical charge displacements in water
[DE94-007530] p 1236 N95-20277
Electrostatic noise in the plasma environment around the shuttle
[NASA-TM-106856] p 1415 N95-21188
Electrostatic basis for molecular recognition in photosynthesis
[DE95-002979] p 1440 N95-22075

ELECTROSTRICTION
Laser-Induced Thermal Acoustics (LITA): Four-wave mixing measurement of sound speed, thermal diffusivity, and viscosity
[AD-A286524] p 1372 N95-21009

ELECTROWEAK INTERACTIONS (FIELD THEORY)
New strong interactions above the electroweak scale
[DE94-018385] p 1506 N95-20025
Complementarity of e(+)e(-) and pp colliders for the exploration of electroweak symmetry breaking
[DE94-017397] p 1507 N95-20034
Diffusion enhances spontaneous electroweak baryogenesis
[DE94-017574] p 1512 N95-20451

Parity nonconservation in radioactive atoms: An experimental perspective
[DE95-002737] p 1518 N95-21235

Electroweak boson pair production in p(-p) collisions at the square root of s = 1.8 TeV
[DE95-000725] p 1527 N95-22194

Physics at the Fermilab Collider
[DE95-000726] p 1539 N95-22195

ELECTROWEAK MODEL

Theoretical particle physics
[DE95-002447] p 1515 N95-20893

ELEMENTARY EXCITATIONS

Energy gap structure of layered superconductors
[DE94-017885] p 1566 N95-20372

Charge density of fractional charged quasiparticles in the composite fermion picture
[DE94-018122] p 1524 N95-21703

ELEMENTARY PARTICLE INTERACTIONS

Nonperturbative aspects of the quark-photon vertex
[DE94-012846] p 1520 N95-21315

Strange hadronic matter
[DE94-019345] p 1521 N95-21484

Structure functions and structure function ratio F2(n)/F2(p) at low X(Bj) and Q2 in inelastic muon scattering
[DE94-018979] p 1573 N95-21561

Measurement of the B meson differential cross-sections in p(bar p) collisions at (radical)s = 1.8 TeV using the exclusive decays B(sup (+-)) (yields) J/(psi)K(sup (+-)) and B(sup 0) (yields) J/(psi)K*(sup 0)
[DE94-018993] p 1523 N95-21562

Search for new particles decaying to dijets in p(bar p) collisions at (radical)s = 1.8 TeV
[DE94-018994] p 1523 N95-21563

Status of the DO top search
[DE95-002214] p 1525 N95-21715

The status of molecules
[DE95-000952] p 1526 N95-21939

The 9th INS scientific computational programs
[DE94-770780] p 1526 N95-22051

Single particle measurements and two particle interferometry results from CERN experiment NA44
[DE95-003041] p 1527 N95-22078

Constraints on the left-right symmetric model from b yields s gamma
[DE95-003469] p 1528 N95-22239

Topics in gauge theories and the unification of elementary particle interactions
[DE94-013485] p 1529 N95-22279

ELEMENTARY PARTICLES

Using science centers to expose the general public to the microworld
[DE95-000647] p 1508 N95-20132

ELEMENTS

Lattice results for heavy light matrix elements
[DE94-019101] p 1523 N95-21551

ELEVATION ANGLE

Modeling tropospheric ducting effects on satellite-to-ground paths p 1295 N95-20936

ELLIPTIC DIFFERENTIAL EQUATIONS

Weighted strongly elliptic operators on lie groups
[PB95-110847] p 1487 N95-19917

Role of pressure diffusion in non-homogeneous shear flows p 1345 N95-21053

Modeling near wall effects in second moment closures by elliptic relaxation p 1345 N95-21054

Positive rockland operators
[PB95-127510] p 1493 N95-21423

Stability of pressure and velocity computations for heterogeneous reservoirs
[PB95-110284] p 1354 N95-21656

ELLIPTIC FUNCTIONS

Elliptic genera for Z/K-manifolds I
[PB95-109096] p 1496 N95-22355

ELLIPTICAL GALAXIES

Far-infrared mapping of dusty elliptical galaxies
p 1593 N95-21763

ELLIPTICAL ORBITS

Orbit determination of highly elliptical Earth orbiters using improved Doppler data-processing modes
p 1218 N95-21533

Nonlinear dynamics of the planar pitch attitude motion for a gravity-gradient satellite
[AD-A286407] p 1220 N95-22204

ELLIPTICAL POLARIZATION

Effect of cell size on elliptically polarized radar clutter statistics
[AD-A285789] p 1311 N95-22401

EMBEDDING

The thermal conductivity of carbon coated silicon carbide fibers embedded in a silicon carbide matrix
[DE94-017758] p 1225 N95-20023

The Modified Embedded Atom Method
[DE94-015746] p 1564 N95-20142

An IRAS Hires study of low mass star formation in the Taurus molecular ring p 1593 N95-21767

Embedded optical fibres as strain sensors in polymer matrix fibre composites: The influence of adhesion in strain transfer
[PB95-133617] p 1547 N95-22140

The Modified Embedded Atom Method
[DE94-017958] p 1248 N95-22273

EMERGENCIES

QoS driven routing in packet switched networks of multiple transmission media p 1292 N95-20923

EMISSION

Universal features of multiplicity distributions
[DE94-012854] p 1498 N95-20779

Micrometeorological methods for measurements of mercury emissions over contaminated soils
[DE94-017679] p 1411 N95-22342

EMISSION SPECTRA

Surface characterization and contamination analysis
[NASA-CR-197374] p 1238 N95-20557

Enhancements in the Livermore spectrum analysis package PIXEF
[DE95-002487] p 1272 N95-20895

Two-dimensional imaging of OH in a lean burning high pressure combustor
[NASA-TM-106854] p 1214 N95-21383

EMITTANCE

Qualification test results for blue-red reflecting solar covers p 1320 N95-20525

Angle resolved Auger electron spectroscopy: An alternate tool for identifying electronic excitation processes in solids
[AD-A285375] p 1238 N95-20555

Emittance growth due to negative-mass instability above transition
[DE95-002527] p 1534 N95-20900

Issues in multi-bunch emittance preservation in the NLC
[DE95-002894] p 1534 N95-21253

First results from the final focus test beam
[DE95-002897] p 1535 N95-21255

Emittance dilution by ions in the SLC arcs
[DE95-002871] p 1536 N95-21332

RF vacuum microelectronics based on thin film edge-emitter technology
[AD-A279539] p 1331 N95-21690

Proposed emittance upgrade for the SLC damping rings
[DE95-002887] p 1538 N95-22155

EMITTERS

Optimization of InAsSb/InGaAs strained-layer superlattice growth by metal-organic chemical vapor deposition for use in infrared emitters
[DE94-016557] p 1563 N95-19954

Annealing of irradiated n+p InP buried homojunctions
p 1320 N95-20524

Field-emitter arrays for RF vacuum microelectronics
[AD-A279959] p 1325 N95-20661

Emitter location via Kalman filtering of signal time difference of arrival
[AD-A285972] p 1291 N95-20666

EMPLOYMENT

Beyond telecommuting: A new paradigm for the effect of telecommunications on travel
[DE95-001224] p 1289 N95-20214

EMULSIONS

Novel electrochemical materials prepared by sol-gel chemistry
[AD-A286310] p 1226 N95-20092

ENCAPSULATING

The Photovolatic Manufacturing Technology project (PVMaT) after three years
[DE94-011877] p 1392 N95-20473

Enhancement of cell mediated immunity through non-specific immunostimulation with liposome encapsulated gamma-interferon
[AD-A279667] p 1442 N95-20602

Synthesis of polymeric microcapsule arrays and their use for enzyme immobilization
[AD-A279125] p 1277 N95-21876

ENCLOSURE

Global equivalence ratio concept and the prediction of carbon monoxide formation in enclosure fires
[PB94-207511] p 1234 N95-20100

ENDOTHERMIC REACTIONS

Ferrocyanide safety project Dynamic X-Ray Diffraction studies of sodium nickel ferrocyanide reactions with equimolar nitrate/nitrite salts
[DE94-017396] p 1236 N95-20268

Subduction and volatile recycling in Earth's mantle
p 1421 N95-21802

ENERGETIC PARTICLES

Ion scattering and deposition: The role of energetic particles in thin film growth
[AD-A285975] p 1514 N95-20667

Numerical analysis of energetic particle stabilization of ballooning modes in finite-aspect-ratio tokamaks
[DE94-631397] p 1556 N95-21164

Search for Centauro events in the DO Detector at Fermilab collider
[DE95-002522] p 1535 N95-21314

Solar wind composition
[NASA-TM-197364] p 1604 N95-22384

ENERGY ABSORPTION

Impact behavior of FeAl alloy FA-350
[DE94-018128] p 1254 N95-20705

Method and apparatus for classifying targets
[AD-D016519] p 1303 N95-21464

ENERGY BUDGETS

Radiative forcing calculations for CH3Cl
[DE94-019018] p 1402 N95-20355

ENERGY CONSERVATION

Research on the promotion measures to introduce new energy and energy-saving technologies with a leasing system
[DE95-714801] p 1375 N95-22079

ENERGY CONSUMPTION

Effects of battery technologies, driving patterns, and climate comfort control on the performance of electric vehicles
[DE95-001102] p 1329 N95-21296

Performance testing of the AC propulsion ELX electric vehicle
[DE95-002049] p 1330 N95-21471

Design of a 10 bit 10k Samples/s low power CMOS ADC
[PB95-110425] p 1455 N95-22018

ENERGY CONVERSION

Research in the chemical sciences: Summaries of FY 1994
[DE94-015427] p 1223 N95-20264

Modeling of high efficiency solar cells under laser pulse for power beaming applications p 1318 N95-20516

High efficiency GaP power conversion for Betavoltaic applications p 1323 N95-20540

Approaches to the design of structural ceramics incorporating whiskers and particulate phases
[DE94-018126] p 1271 N95-20704

A fuel cell overview
[DE95-001455] p 1393 N95-20839

Exploratory Technology Research Program for electrochemical energy storage
[DE95-002652] p 1394 N95-20915

Use of the National Ignition Facility for the development of inertial fusion energy
[DE94-016696] p 1557 N95-21206

ENERGY CONVERSION EFFICIENCY

Chemical beam epitaxy for high efficiency photovoltaic devices p 1316 N95-20508

Status of diffused junction p+n InP solar cells for space applications p 1317 N95-20509

Design of high-efficiency, radiation-hard, GaInP/GaAs solar cells p 1319 N95-20521

InGaAs PV device development for TPV power systems p 1322 N95-20537

Pulsed laser illumination of photovoltaic cells
p 1323 N95-20538

High efficiency GaP power conversion for Betavoltaic applications p 1323 N95-20540

Review of solar cell temperature coefficients for space
p 1323 N95-20541

Effects of plasma hydrogenation on trapping properties of dislocations in heteroepitaxial InP/GaAs
p 1323 N95-20542

Cryogenic pellet laser plasma source targets
[DE95-002488] p 1376 N95-22169

Coherence properties of high order harmonic radiation
[DE94-016974] p 1377 N95-22312

ENERGY DISSIPATION

A photophysical control mechanism for zeaxanthin-associated radiationless energy dissipation in photosynthesis
[DE94-018383] p 1437 N95-19969

Magnetic fluctuation induced transport and edge dynamo measurements in the MST reversed-field pinch
[DE95-000591] p 1549 N95-20114

Atomic-resolution characterization of interface structure and chemistry in the STEM
[DE94-017753] p 1567 N95-20492

The use of displacement damage dose to correlate degradation in solar cells exposed to different radiations
p 1320 N95-20523

Parasitic current collection by solar arrays in LEO
p 1321 N95-20527

On FEL integral equation and electron energy loss in intermediate gain regime
[DE94-770631] p 1371 N95-20757

Time of flight spectroscopy with muonic hydrogen
[DE94-017056] p 1245 N95-21845

High performance computing for beam physics applications
[DE94-018312] p 1539 N95-22243

ENERGY DISTRIBUTION
A new alpha particle diagnostic using knock-on ion tails
[DE94-015856] p 1553 N95-20402
Excess energy and structural dependence of the rate of energy redistribution during the photodissociation of iodotoluenes
[AD-A279997] p 1241 N95-21124
Ab initio potential energy surface for H + OCS reactions: Extended basis sets and correlation treatment
[AD-A286420] p 1247 N95-22207

ENERGY GAPS (SOLID STATE)
Optimization of InAsSb/InGaAs strained-layer superlattice growth by metal-organic chemical vapor deposition for use in infrared emitters
[DE94-016557] p 1563 N95-19954
InGaAs PV device development for TPV power systems p 1322 N95-20537
Magnetic field dependence of the correlation gap in SmB6
[DE95-001684] p 1574 N95-21570
Performance of Ga(0.47)In(0.53)As cells over a range of proton energies
[NASA-TM-106819] p 1334 N95-22112

ENERGY LEVELS
Ultrafast magnetoexciton dynamics in GaAs
[DE94-018175] p 1514 N95-20732
Collisional redistribution effects on x ray laser saturation behavior
[DE94-017308] p 1374 N95-21663
Electronic structure and energies of alkaline earth oxides: MgO, CaO and SrO
[DE94-628990] p 1575 N95-21853
Electronic structure and relative stability of icosahedral superatoms in Al-transition-metal alloys
[DE94-628996] p 1260 N95-21855
Universal spectral correlations at the mobility edge
[DE94-629031] p 1528 N95-22217

ENERGY OF FORMATION
IR materials producibility
[AD-A280094] p 1328 N95-21017
Effect of the electron-SO-phonon on the impurity state energies in a semiconductor quantum well
[DE94-628993] p 1581 N95-21887

ENERGY POLICY
Proceedings of the 1994 DOE/NREL Hydrogen Program Review
[DE94-011835] p 1234 N95-20117
Energy and environmental issues and international opperation in Asia
[DE94-796596] p 1404 N95-21143
Research on the promotion measures to introduce new energy and energy-saving technologies with a leasing system
[DE95-714801] p 1375 N95-22079

ENERGY SOURCES
Accelerators for energy production
[DE94-770764] p 1392 N95-20685
The Materials Corrosion and Environmental Effects Laboratory (MCEL)
[DE94-018268] p 1254 N95-20816

ENERGY SPECTRA
Ion temperature measurement of indirectly-driven implosions using a geometry-compensated neutron time-of-flight detector
[DE94-016967] p 1552 N95-20362
On the asymptotic similarity of rotating homogeneous turbulence p 1345 N95-21058
Heavy ion track-structure calculations for radial dose in arbitrary materials
[NASA-TP-3497] p 1517 N95-21191
Physics of correlated studies
[DE95-001204] p 1581 N95-21842
Electronic structure and relative stability of icosahedral superatoms in Al-transition-metal alloys
[DE94-628996] p 1260 N95-21855
Observations of cold magnetospheric ions at geosynchronous orbit during times of high activity
[DE95-000936] p 1600 N95-21935
Experimental study of interactions of highly charged ions with atoms at keV energies
[DE94-018648] p 1529 N95-22316
Notes on rotating turbulence p 1359 N95-22444

ENERGY STORAGE
The Materials Corrosion and Environmental Effects Laboratory (MCEL)
[DE94-018268] p 1254 N95-20816
An overview: Component development for solar thermal systems
[DE95-001623] p 1393 N95-20862
Mars power system concept definition study. Volume 1: Study results
[NASA-CR-195420-VOL-1] p 1396 N95-21952
Mars power system concept definition study. Volume 2: Appendices
[NASA-CR-195420-VOL-2] p 1396 N95-21953
Quantum chemical study of rare gas/halide interactions as a model for high energy density material. 2: The interaction of hydrogen chloride with the rare gas xenon
[AD-A286385] p 1248 N95-22321
Advanced energy systems and technologies research programme
[DE95-717486] p 1397 N95-22337
Indian Academy of Sciences. Volume 105, number 6, December 1993. Proceedings of the 2nd International Conference on Solar Energy Storage Applied Photochemistry
[AD-A286481] p 1605 N95-22394

ENERGY TECHNOLOGY
Energy and Technology Review
[DE94-017686] p 1219 N95-20148
Proceedings of the 1993 Non-Fluorocarbon Insulation, Refrigeration and Air Conditioning Technology Workshop
[DE94-018333] p 1285 N95-20194
Research in the chemical sciences: Summaries of FY 1994
[DE94-015427] p 1223 N95-20264
Energy impacts of controlling carbon dioxide emissions from an integrated gasification/combined-cycle system
[DE94-016878] p 1403 N95-20478
An update on the Department of Energy's photovoltaic program p 1316 N95-20505
Rare earth garnet selective emitter
p 1322 N95-20536
The Energy Science and Technology Database on a local library system: A case study at the Los Alamos National Research Library
[DE95-001009] p 1589 N95-20818
Technical and economic evaluation of natural gas based synthesis gas production technologies
[PB95-130597] p 1242 N95-21426
Applications of ICP magnetic sector multicollector mass spectrometry to basic energy research
[DE95-002600] p 1246 N95-21886
Research on the promotion measures to introduce new energy and energy-saving technologies with a leasing system
[DE95-714801] p 1375 N95-22079
Advanced energy systems and technologies research programme
[DE95-717486] p 1397 N95-22337
Indian Academy of Sciences. Volume 105, number 6, December 1993. Proceedings of the 2nd International Conference on Solar Energy Storage Applied Photochemistry
[AD-A286481] p 1605 N95-22394
Producing liquid fuels from biomass
[DE95-717458] p 1398 N95-22425
Wind Energy Program overview, fiscal year 1993
[DE94-000285] p 1398 N95-22468

ENERGY TRANSFER
A numerical investigation of energy transfer and subgrid-scale eddy viscosity in homogeneous, isotropic and shear turbulence
[AD-A280005] p 1339 N95-20058
Photodegradation and photophysics of laser dyes
[AD-A285105] p 1368 N95-20063
Plasma chemistry of vibrationally nonequilibrium molecules
[AD-A279630] p 1553 N95-20411
State-to-state collisional dynamics of atmospheric species
[AD-A285053] p 1370 N95-20484
Heavy ion track-structure calculations for radial dose in arbitrary materials
[NASA-TP-3497] p 1517 N95-21191
Single-collision studies of energy transfer and chemical reaction
[DE95-002943] p 1244 N95-21517

ENGINE DESIGN
Internal aerodynamics of a generic three-dimensional scramjet inlet at Mach 10
[NASA-TP-3476] p 1340 N95-20619
Turbine design and application
[NASA-SP-290] p 1214 N95-22341

ENGINE INLETS
Active control of fan noise-feasibility study. Volume 1: Flyover system noise studies
[NASA-CR-195392-VOL-1] p 1505 N95-21888

ENGINE NOISE
Active control of fan noise-feasibility study. Volume 1: Flyover system noise studies
[NASA-CR-195392-VOL-1] p 1505 N95-21888

ENGINE PARTS
Evaluation of PS 212 coatings under boundary lubrication conditions with an Ester-based oil to 300 C
[NASA-TM-106763] p 1223 N95-19901
Toughened Silcomp composites for gas turbine engine applications
[DE95-002851] p 1214 N95-21243

ENGINE TESTS
Statistical analysis of Turbine Engine Diagnostic (TED) field test data
[AD-A286032] p 1379 N95-20998
Portable static test facility for small, expendable, turbojet engines, phase 1
[AD-A286337] p 1216 N95-21719

ENGINEERING DRAWINGS
The ITER in-vessel system
[DE94-018053] p 1560 N95-21665

ENGINEERING MANAGEMENT
Improving cost efficiency in large programs
p 1584 N95-20743
Benefits of CMM-based software process improvement: Executive summary of initial results
[AD-A286444] p 1468 N95-21567
Interim profile: Development and trial of a method to rapidly measure software engineering maturity status
[AD-A279074] p 1468 N95-21627

ENRICHMENT
Nitrogen isotopic components in the early solar system p 1420 N95-21800

ENSTATITE
Phase E in a water-saturated peridotite system at 9.3 GPa p 1420 N95-21799

ENTHALPY
Conditional statistics in a turbulent premixed flame derived from direct numerical simulation
p 1249 N95-22438

ENTIRE FUNCTIONS
The method of evaluating quantum partition function for the Hubbard model
[DE94-628991] p 1581 N95-21639

ENTRAINMENT
Entrainment in a shear-free turbulent mixing layer
p 1350 N95-21083
Numerical simulation of spatially-developing planar jets p 1351 N95-21087
Mixing and dynamics of the Mediterranean outflow
[AD-A279803] p 1434 N95-21306
Fourth International Symposium on Stratified Flows, volume 4
[AD-A286453] p 1358 N95-22424

ENTROPY
Digital filtering for data compression in telemetry systems
[DE94-016611] p 1219 N95-20567
Thermodynamic analysis of stable and metastable equilibrium diagrams of the Cu-Cr system
[PB95-127775] p 1255 N95-21111

ENUMERATION
An exact enumeration of self-avoiding loops on a square lattice
[DE94-628999] p 1578 N95-22276

ENVIRONMENT EFFECTS
Dust Bowl migration as an analog for possible global warming-induced migration from Mexico
[DE94-017472] p 1401 N95-20089
Corrosion of aircraft materials: Correlation between nanometer scale and macroscopic structural damage parameters
[AD-A285930] p 1252 N95-20299
The effect of regional-scale soil-moisture deficits on mesoscale atmospheric dynamics that influence fire severity
[DE95-002682] p 1413 N95-20455
Molten carbonate fuel cell product development test
[DE95-000005] p 1324 N95-20574
The Materials Corrosion and Environmental Effects Laboratory (MCEL)
[DE94-018268] p 1254 N95-20816
Computer model predictions of the local effects of large, solid-fuel rocket motors on stratospheric ozone
[AD-A285632] p 1404 N95-21150
Definition report on environmental indices in future environmental assessments environmental balance/environmental outlook
[PB95-131876] p 1405 N95-21350
Environmental Hazards Assessment Program
[DE94-019075] p 1406 N95-21565
Air pollution caused by fireworks during the turn of the year 1992-1993
[PB95-135265] p 1409 N95-21718
Methods and opportunities in the recycling of rare Earth based materials
[DE95-001680] p 1259 N95-21737
Compilation of 1993 annual reports of the Navy ELF Communications System Ecological Monitoring Program. Volume 2: Tabs C-F
[AD-A279770] p 1308 N95-21988
Initial assessment of the hazards and risks of new chemicals to man and the environment, part 2
[PB95-106407] p 1410 N95-22124
Environmental Compliance Assessment System (ECAS): Japan settlement
[AD-A279328] p 1410 N95-22142

Assessment of the atmospheric hazards and risks of new chemicals: Procedures to estimate hazard potentials
[PB95-107488] p 1410 N95-22186
Launch safety, toxicity, and environmental effects of the high performance oxidizer ClF(5)
[AD-A286095] p 1284 N95-22227

ENVIRONMENT MANAGEMENT
Environmental Compliance Assessment and Management Program
[AD-A279605] p 1402 N95-20441
Possible global environmental impacts of solid waste practices
[DE95-000830] p 1406 N95-21487
Selection of substances to be considered in the environmental balance/environmental outlook in relation to the dissemination theme
[PB95-132197] p 1407 N95-21635
Environmental Compliance Assessment and Management Program (ECAMP), South Carolina supplement
[AD-A279533] p 1408 N95-21689
Environmental Compliance Assessment System (ECAS): Japan settlement
[AD-A279328] p 1410 N95-22142

ENVIRONMENT POLLUTION
Mercury usage and alternatives in the electrical and electronics industries
[PB94-165362] p 1312 N95-19966
Performance specifications for technology development: Application for characterization of volatile organic compounds in the environment
[DE94-016627] p 1401 N95-20234
Environmental Compliance Assessment and Management Program
[AD-A279605] p 1402 N95-20441
Environmental cleanup technology transfer initiatives
[AD-A285059] p 1403 N95-20487
Guidelines for qualifying cleaning and verification materials
[NASA-TM-108474] p 1270 N95-20694
Possible global environmental impacts of solid waste practices
[DE95-000830] p 1406 N95-21487
Environmental Hazards Assessment Program
[DE94-019075] p 1406 N95-21565
Spectroscopic studies of hazardous fuel interactions with soils
[AD-A279099] p 1407 N95-21596
Implementation of electronic chain-of-custody, analysis requests, and data verification at Los Alamos National Laboratory
[DE94-018076] p 1407 N95-21666
Launch safety, toxicity, and environmental effects of the high performance oxidizer ClF(5)
[AD-A286095] p 1284 N95-22227

ENVIRONMENT PROTECTION
Calculation methods for criteria air pollutant emission inventories
[AD-A284675] p 1400 N95-19964
Environmental Compliance Assessment and Management Program
[AD-A279605] p 1402 N95-20441
Environmental cleanup technology transfer initiatives
[AD-A285059] p 1403 N95-20487
Environmental Compliance Assessment Protocol - Centers for Disease Control and Prevention (ECAP-CDC), West Virginia supplement
[AD-A286009] p 1403 N95-20720
Energy and environmental issues and international opperation in Asia
[DE94-796596] p 1404 N95-21143
Disinfection of purified waste water with ultra violet light on a technical scale
[PB95-131926] p 1405 N95-21330
Monitoring activities in the framework of the Dutch National Air Quality Monitoring Network in 1994
[PB95-131884] p 1406 N95-21351
Removal of CO2 in closed loop off-gas treatment systems
[DE94-019259] p 1407 N95-21617
Environmental Compliance Assessment and Management Program (ECAMP), South Carolina supplement
[AD-A279533] p 1408 N95-21689
Environmental Compliance Assessment System (ECAS): Oregon supplement
[AD-A279565] p 1408 N95-21696
Ozone-depleting-substance control and phase-out plan
[DE95-001647] p 1409 N95-21722
Compilation of 1993 annual reports of the Navy ELF Communications System Ecological Monitoring Program. Volume 2: Tabs C-F
[AD-A279770] p 1308 N95-21988
Initial assessment of the hazards and risks of new chemicals to man and the environment, part 2
[PB95-106407] p 1410 N95-22124
Derivation of preliminary maximum permissible concentrations of volatile compounds in air
[PB95-107447] p 1410 N95-22125
Guidelines for the creation and management of geographic data bases within a GIS environment, version 1.0. Volume 2. Appendices
[DE94-019215] p 1591 N95-22129
Environmental Compliance Assessment System (ECAS): Japan settlement
[AD-A279328] p 1410 N95-22142
Proceedings of the 4th Annual Major Range and TestFacility Base (MRTFB) Environmental Workshop
[AD-A285779] p 1411 N95-22414
Fuzzy clustering of facial form for prototyping environmental protection equipment
[DE94-014657] p 1454 N95-22466

ENVIRONMENT SIMULATION
Measuring presence in virtual environments
[AD-A286183] p 1460 N95-20326

ENVIRONMENTAL CHEMISTRY
Investigation on research for degradable plastics
[DE94-796550] p 1277 N95-21714

ENVIRONMENTAL ENGINEERING
Long Time Series Measurements in the Coastal Ocean: A workshop
[AD-A279509] p 1435 N95-21682
ANSTO: Program of research, 1993-1994
[DE94-631122] p 1605 N95-21828

ENVIRONMENTAL INDEX
Definition report on environmental indices in future environmental assessments environmental balance/environmental outlook
[PB95-131876] p 1405 N95-21350

ENVIRONMENTAL LABORATORIES
Sustaining the health and performance of soldiers/warfighters deployed to harsh environments
[AD-A286270] p 1446 N95-22004

ENVIRONMENTAL MONITORING
USAF cellular mechanism of turnover of the stress induced protein HSP70
[AD-A285618] p 1441 N95-19898
Environmental Compliance Assessment and Management Program
[AD-A279605] p 1402 N95-20441
Possible global environmental impacts of solid waste practices
[DE95-000830] p 1406 N95-21487
Implementation of electronic chain-of-custody, analysis requests, and data verification at Los Alamos National Laboratory
[DE94-018076] p 1407 N95-21666
Definition report on target and related steering variables of radiation as a part of the environmental balance and environmental outlook investigation
[PB95-135471] p 1409 N95-21846

ENVIRONMENTAL QUALITY
Closure on the global carbon cycle
[DE94-018617] p 1404 N95-20991
Derivation of preliminary maximum permissible concentrations of volatile compounds in air
[PB95-107447] p 1410 N95-22125
Derivation of maximum permissible concentrations for several volatile compounds for water and soil
[PB95-107454] p 1411 N95-22381

ENVIRONMENTAL SURVEYS
Selection of substances to be considered in the environmental balance/environmental outlook in relation to the dissemination theme
[PB95-132197] p 1407 N95-21635
The mechanisms and effects off the plant-activations of chemicals in the environment
[AD-A279388] p 1356 N95-22145

ENVIRONMENTAL TESTS
The environmental durability of fiber reinforced ceramic matrix composites
[AD-A283750] p 1225 N95-19919
Test Operations Procedure (TOP) 1-2-616 tropic exposure testing
[AD-A286376] p 1235 N95-20230
Evaluation of stress experienced by soldiers wearing chemical protective clothing during varying work loads in desert or tropical environments
[AD-A280113] p 1452 N95-20625

ENZYME ACTIVITY
Process strategies in the enzymatic resolution of enantiomers
[PB95-107850] p 1437 N95-20208
A low energy continuous reactor separator for the production of ethanol from corn grits/starch and biomass streams
[DE95-002256] p 1283 N95-21356
Structures and functions of oligosaccharins
[DE95-003195] p 1440 N95-22220

ENZYMES
Process strategies in the enzymatic resolution of enantiomers
[PB95-107850] p 1437 N95-20208
Bacterial luciferase: Determination of the structure by x-ray diffraction
[AD-A279699] p 1437 N95-20711
Calculation of atom-centered partial charges for heme
[DE94-014447] p 1520 N95-21375
Synthesis of polymeric microcapsule arrays and their use for enzyme immobilization
[AD-A279125] p 1277 N95-21876

EPIDEMIOLOGY
Urban air carcinogens and their effects on health
[DE95-002259] p 1447 N95-22285
Current concepts on airborne particles and health
[DE95-002260] p 1447 N95-22287

EPITAXY
Visible light emitting materials and injection devices
[AD-A284796] p 1541 N95-20066
Simulations of the dislocation array at Ge/Si interfaces
[DE94-017680] p 1565 N95-20244
Surface stress, morphological development, and dislocation nucleation during strained-layer epitaxy
[DE94-017682] p 1565 N95-20245
High-efficiency, deep-junction, epitaxial InP solar cells on (100) and (111)B InP substrates
p 1316 N95-20507
P/N InP solar cells on Ge wafers
p 1317 N95-20511
Performance, defect behavior and carrier enhancement in low energy, proton irradiated p+nn+ InP solar cells
p 1319 N95-20518
P/N In(Al) GaAs multijunction laser power converters
p 1323 N95-20539
Effects of plasma hydrogenation on trapping properties of dislocations in heteroepitaxial InP/GaAs
p 1323 N95-20542
Nucleation, growth, and strain relaxation of lattice-mismatched 3-5 semiconductor epitaxial layers
p 1324 N95-20543
Antiphase boundaries as nucleation centers in low-temperature epitaxial growth
[AD-A279895] p 1568 N95-20594
Growth, characterization and device development in monocrystalline diamond films
[AD-A285991] p 1568 N95-20614
The in situ observation of epitaxial diamond thin film nucleation and growth using emission electron microscopy
[AD-A279811] p 1569 N95-20807
Scanning tunneling microscopy of semiconductor surfaces
[AD-A279982] p 1571 N95-20964
Ultra-high aggregate bandwidth two-dimensional multiple-wavelength diode laser arrays
[AD-A280098] p 1372 N95-21019
Epitaxial liftoff technology onto processed silicon foundry wafers
[AD-A285621] p 1571 N95-21145
Interlayer magnetic coupling in epitaxial Fe/Cr(211) and (100) superlattices
[DE95-002906] p 1571 N95-21256
Reciprocal space mapping of epitaxial materials using position-sensitive x-ray detection
[DE95-001620] p 1575 N95-21991

EPOXY MATRIX COMPOSITES
Significance of impact velocity for the extent of damage in carbon/epoxy laminates
[PB95-133484] p 1230 N95-21417
Effect of laser radiation on carbon fibre/epoxy composites
[PB95-133526] p 1232 N95-22096

EPOXY RESINS
VOC compliant wash primer
[AD-A286034] p 1273 N95-21000
Damage tolerance of carbon fibre polyetheretherketone laminates
[PB95-131611] p 1230 N95-21432
Epoxy lining for shipboard piping systems
[AD-A286228] p 1279 N95-22022
Towards tailored interphase formation utilizing surface-bound benzylsulfonium salts as cationic initiators
[AD-A286461] p 1280 N95-22259

EQUATIONS OF MOTION
Matrix formulation of the particle motion in crystalline beams
[DE94-017301] p 1563 N95-19925
Comparison of meteorological data with fitted values extracted from projectile trajectory
[AD-A285921] p 1428 N95-19989
Hybrid model in general geometry
[DE95-002614] p 1553 N95-20437
Three-dimensional laser cooling
[DE94-017963] p 1370 N95-20569

Large eddy simulation of channel flow using a vorticity transport subgrid model p 1348 N95-21076
A model of an infinite length, axisymmetric, isotropic, forced thick shell
[AD-A285586] p 1386 N95-21212
On the Aharonov-Bohm effect with neutrons
[DE95-002985] p 1521 N95-21454
1/f noise in two-dimensional fluids
[DE95-002617] p 1358 N95-22307
Direct numerical simulations of on-demand vortex generators: Mathematical formulation
p 1361 N95-22452

EQUATIONS OF STATE
On the Taylor test. Part 3: A continuum mechanics code analysis of steady plastic wave propagation
[DE95-002252] p 1501 N95-20869
Hydrogen and related materials at high density: Physics, chemistry and planetary implications
p 1418 N95-21791
Storage and recycling of water and carbon dioxide in the earth p 1425 N95-21822
Variational Monte Carlo study of He-4 in two dimensions
[DE94-629078] p 1576 N95-21998
Thermophysical properties of HFC-143a and HFC-152a
[DE95-002199] p 1582 N95-22153

EQUATORIAL REGIONS
Hydrographic data from equatorial Pacific waters near the Galapagos
[AD-A283741] p 1431 N95-19918
Mitigation of the effects of F layer regularities by using multiple paths p 1298 N95-20951
Semi-volatiles at Mercury: Sodium (Na) and potassium (K) p 1424 N95-21818
Exchanges between hemispheres and gyres: A direct approach to the mean circulation of the equatorial Pacific
[NASA-CR-196311] p 1436 N95-22072

EQUILIBRIUM FLOW
Stability of pressure and velocity computations for heterogeneous reservoirs
[PB95-110284] p 1354 N95-21656
Large-eddy simulation of a boundary layer with concave streamwise curvature p 1360 N95-22450

EQUIVALENCE
Duality and equivalencies in closed tandem queueing networks
[PB95-132502] p 1482 N95-21271
Testing the principle of equivalence by solar neutrinos
[DE94-014972] p 1604 N95-22064

ERBIUM
Rare earth garnet selective emitter
p 1322 N95-20536

ERBIUM ALLOYS
The low temperature properties of (Dy(1-x)Er(x))Ni2 alloys
[DE95-001657] p 1260 N95-21923

ERGODIC PROCESS
Invariant measures of interval maps
[PB95-107835] p 1389 N95-20207

ERGOMETERS
A method to determine the kinematics of the lower limbs of a subject pedaling a bicycle using encoders and accelerometers
[NASA-CR-197401] p 1453 N95-21866

EROSION
Aircraft corrosion study
[AD-A279527] p 1259 N95-21687
Dynamics of volatile delivery from outer to inner solar system p 1420 N95-21798

ERROR ANALYSIS
A simple analytical model for asynchronous dense WDM/OOK systems
[AD-A283725] p 1289 N95-19973
A-posteriori estimation and adaptive control of the pollution-error in the h-version of the finite element method
[AD-A285670] p 1480 N95-20083
Iterated-bootstrap confidence intervals for the mean
[AD-A279802] p 1498 N95-20102
Uncertainty estimates for derivatives and intercepts
[DE94-018492] p 1489 N95-20222
Error analysis in wind turbine field testing
[DE94-011864] p 1391 N95-20260
Analysis of direct detection lightwave systems with optical amplifiers
[AD-A284077] p 1542 N95-20467
On commonalities in signal design for non-Gaussian channels
[AD-A285385] p 1498 N95-20608
Error probabilities of FFH/BFSK with noise normalization and soft decision viterbi decoding in a fading channel with partial-band jamming
[AD-A280041] p 1498 N95-20620
An empirical approach to logical clustering of software failure regions
[AD-A279863] p 1462 N95-20776
Geographical diversity combining to exploit multi-mechanism propagation p 1299 N95-20957
Error analysis of the quadratic nodal expansion method in slab geometry
[DE95-001352] p 1492 N95-21285
Error committed by stopping the Newton iteration in Runge-Kutta methods and linear multistep methods
[PB95-106324] p 1492 N95-21421
Orbit determination of highly elliptical Earth orbiters using improved Doppler data-processing modes
p 1218 N95-21533
Analysis of a local defect correction approach on composite grids
[PB95-135455] p 1493 N95-21574
Initial experience with noncorrecting syntax error handling
[PB95-132700] p 1471 N95-22029
LADAR detection statistics in the presence of pointing errors
[AD-A285865] p 1309 N95-22134
Performance of a fast frequency-hopped noncoherent MFSK receiver over Rician fading channels with either partial-band interference or multi-tone interference
[AD-A286168] p 1310 N95-22246
Pollution error in the H-version of the finite element method and the local quality of A-posteriori error estimators
[AD-A279868] p 1497 N95-22388
Simulation of structural response using a recurrent radial basis function network
[DE94-017342] p 1486 N95-22409

ERROR CORRECTING CODES
Fault tolerance of neural networks
[AD-A285098] p 1479 N95-20057
Seamless data-range change using punctured convolutional codes for time-varying signal-to-noise ratios p 1304 N95-21534
Turbo codes for deep-space communications
p 1304 N95-21535

ERROR CORRECTING DEVICES
Analysis of a local defect correction approach on composite grids
[PB95-135455] p 1493 N95-21574

ERROR DETECTION CODES
New method for integrity constraint checking in deductive databases
[PB95-110672] p 1586 N95-19904
Initial experience with noncorrecting syntax error handling
[PB95-132700] p 1471 N95-22029
Top-down non-correcting error recovery in LLgen
[PB95-132718] p 1471 N95-22031
Computing symmetries and stubborn sets
[PB95-127700] p 1472 N95-22328

ERROR FUNCTIONS
Neural network construction via back-propagation
[DE95-002867] p 1482 N95-21249

ERRORS
A-posteriori estimation and adaptive control of the pollution-error in the h-version of the finite element method
[AD-A285670] p 1480 N95-20083
EPICS simulation tools for control system development
[DE94-018082] p 1462 N95-20699
Conservative smoothing versus artificial viscosity
[DE95-001108] p 1341 N95-20831
Backward error recovery in redundant disk arrays
[AD-A286064] p 1463 N95-20846
Multipath impact on ground-based global positioning system range measurements: Aspects of measurement, modeling, and mitigation p 1297 N95-20949
Impact of propagation mechanisms on global navigation satellite system performance p 1298 N95-20950
Geographical diversity combining to exploit multi-mechanism propagation p 1299 N95-20957
Accuracy problems in the generation of discrete time stochastic processes
[PB95-131397] p 1386 N95-21133
Neural network construction via back-propagation
[DE95-002867] p 1482 N95-21249
Design and development SAWAFE peak detector chip
[DE95-001745] p 1332 N95-21742
SEU and SEL response of the Westinghouse 64K E-2PROM, analog devices AD7876 12-bit ADC, and the Intel 82527 Serial Communications Controller
[DE95-003349] p 1334 N95-22086
Adaptive fault-resistant systems
[AD-A286406] p 1484 N95-22203
Pollution error in the H-version of the finite element method and the local quality of A-posteriori error estimators
[AD-A279868] p 1497 N95-22388
A survey of artificial neural network applications in flow analysis of energy networks
[DE95-002452] p 1486 N95-22430

ESTERS
Polyurethane-acrylic interpenetrating polymer network acoustic damping material
[AD-D016572] p 1266 N95-20294
Thermo-mechanical fatigue of polymer matrix composites
[AD-A285931] p 1267 N95-20390

ESTIMATES
Structure and dynamics of turbulent wall layers
[AD-A285360] p 1340 N95-20547
Development of a fast sampling system for estimation of impulse responses of mobile radio channels
p 1296 N95-20943
Nitrogen isotopic components in the early solar system p 1420 N95-21800
Alkali element depletion by core formation and vaporization on the early Earth p 1421 N95-21804

ESTIMATING
Intrinsic barriers for H-atom transfer reactions
[DE94-018914] p 1507 N95-20049
Anaerobic digestion analysis model: User's manual
[DE94-011858] p 1437 N95-20471
Modeling and identification of parallel and feedback nonlinear systems
[DE95-001006] p 1481 N95-20812
Exponential deconvolution: Two asymptotically equivalent estimators
[PB95-132122] p 1499 N95-21469
BASIC program for power spectrum estimation
[DE95-002228] p 1468 N95-21515

ETA-MESONS
Theories of the eta-meson-nucleus interaction
[DE94-016055] p 1516 N95-21125

ETCHING
Study on the reaction kinetics in pulsed RF discharges under RIE conditions
[PB95-107868] p 1300 N95-21029
Plasma-induced-damage of GaAs during etching of refractory metal contacts
[DE95-001525] p 1259 N95-21838
Method for laser-assisted silicon etching using halocarbon ambients
[AD-D016494] p 1375 N95-21903
Design, fabrication, and characterization of reflective diffractive optical elements in Si for free-space optical interconnects
[AD-A286416] p 1547 N95-22205

ETHANE
Structure of dibis(diethyldithiocarbamato) zinc (2) Mu-bis(diethylphosphino)ethane toluene(2)
[AD-A279792] p 1224 N95-20660
Aging tests of ethylene contaminated argon/ethane
[DE95-002526] p 1282 N95-20899
Single-collision studies of energy transfer and chemical reaction
[DE95-002943] p 1244 N95-21517
Numerical study of contaminant effects on combustion of hydrogen, ethane, and methane in air
[NASA-TM-106844] p 1284 N95-22114

ETHERS
Polyurethane-acrylic interpenetrating polymer network acoustic damping material
[AD-D016572] p 1266 N95-20294
A new family of anion receptors and their effects on ion pair dissociation and conductivity of lithium salts in non-aqueous solutions
[DE94-016822] p 1512 N95-20477
New chiral pyrimidino-crown ether ligands
[AD-A279892] p 1223 N95-20590
Towards tailored interphase formation utilizing surface-bound benzylsulfonium salts as cationic initiators
[AD-A286461] p 1280 N95-22259

ETHYL ALCOHOL
Bioconversion of coal derived synthesis gas to liquid fuels
[DE94-018849] p 1314 N95-20339
A low energy continuous reactor separator for the production of ethanol from corn grits/starch and biomass streams
[DE95-002256] p 1283 N95-21356
Producing liquid fuels from biomass
[DE95-717458] p 1398 N95-22425

ETHYL COMPOUNDS
New chiral pyrimidino-crown ether ligands
[AD-A279892] p 1223 N95-20590
Structure of dibis(diethyldithiocarbamato) zinc (2) Mu-bis(diethylphosphino)ethane toluene(2)
[AD-A279792] p 1224 N95-20660
The permeation of bis(2-fluoro-2,2-dinitroethyl) formal (FEFO), ethyl 4,4-dinitropentanoate (EDNP), ethyl 4-nitropentanoate (ENP), and 1,2,4-trichlorobenzene (TCB) through barrier membranes
[DE95-002492] p 1283 N95-21514

ETHYLENE
Aging tests of ethylene contaminated argon/ethane
[DE95-002526] p 1282 N95-20899
The energetics and dynamics of free radicals, ions, and clusters
[DE94-018101] p 1244 N95-21701
Acid-site characterization of water-oxidized alumina films by near-edge x-ray absorption and soft x-ray photoemission
[DE95-003355] p 1247 N95-22234
ETHYLENE COMPOUNDS
Studies of the microwave resistivity of kappa-(BEDT-TTF)2Cu(N(CN)2)Cl
[DE95-002980] p 1262 N95-22291
ETHYLENE OXIDE
The development of a new plasticizer for poly(ethylene oxide) based polymer electrolyte and the investigation of their ion-pair dissociation effect
[DE94-016821] p 1276 N95-21644
ETHYLENEDIAMINE
Evaluation of an immobilized cell bioreactor for degradation of meta- and para-nitrobenzoate
[AD-A279719] p 1516 N95-20993
EULER EQUATIONS OF MOTION
One-dimensional reactive Euler equations
[PB95-135430] p 1244 N95-21573
Fluid dynamics of the freeboard in a fluidized bed reactor
[PB95-134029] p 1357 N95-22160
EULER-LAGRANGE EQUATION
Mathematical modeling of a class of multibody flexible spacecraft structures
[NASA-TM-109166] p 1219 N95-20800
EURECA (ESA)
Post-flight investigation programmes of recently retrieved solar generators p 1321 N95-20531
EUTECTIC ALLOYS
Sputtering of tin and gallium-tin clusters
[DE94-018389] p 1254 N95-20707
EUTECTIC COMPOSITES
The influence of chemistry and microstructure on the fracture toughness of V-V3Si in-situ composites
[DE94-018997] p 1232 N95-22126
EUTECTICS
Directional solidification of the alumina-zirconia ceramic eutectic system
[DE95-001677] p 1277 N95-21735
EUTROPHICATION
Assessment of the atmospheric hazards and risks of new chemicals: Procedures to estimate hazard potentials
[PB95-107488] p 1410 N95-22186
EVALUATION
Evaluation of pumping and fueling requirements for the ITER EDA
[DE94-018117] p 1560 N95-21702
EVAPORATION
The dynamics of formation and evaporation of mixed alkali halide nanocrystals: A case of comparable lattice energies
[AD-A285052] p 1567 N95-20483
An augmented Young-Laplace model of an evaporating meniscus in a micro-channel with high heat flux
[NASA-CR-197622] p 1340 N95-20796
Governing equations for multiphase heat and mass transfer in hygroscopic porous media with applications to clothing materials
[AD-A286418] p 1357 N95-22206
The enhancement of metallic silver monomer evaporation by the adhesion of polar molecules to silver nanocluster ions
[AD-A284936] p 1281 N95-22470
EVAPORATION RATE
An augmented Young-Laplace model of an evaporating meniscus in a micro-channel with high heat flux
[NASA-CR-197622] p 1340 N95-20796
EVAPORATORS
Seawater test results of Open-Cycle Ocean Thermal Energy Conversion (OC-OTEC) components
[DE94-019254] p 1396 N95-21897
EXCIMER LASERS
Sputtering of tin and gallium-tin clusters
[DE94-018389] p 1254 N95-20707
Tribology and surface mechanical properties of excimer laser nitrided titanium
[DE95-002751] p 1255 N95-21238
Time-resolved diagnostics of excimer laser-generated ablation plasmas used for pulsed laser deposition
[DE94-018950] p 1559 N95-21547
Method for laser-assisted silicon etching using halocarbon ambients
[AD-D016494] p 1375 N95-21903
EXCITATION
Cavity-QED enhancement of fluorescence yields in microdroplets
[DE94-018662] p 1506 N95-20030
The electronic properties of polysilanes
[DE94-006464] p 1265 N95-20121
Method and system of mapping acoustic near field
[AD-D016574] p 1504 N95-20296
Observation of excitonic and band-to-band behavior in ordered InGaP2 alloys
[DE94-018891] p 1314 N95-20341
Two-center, two electron excitations identified in NEXAFS for solid Ne
[AD-A285373] p 1568 N95-20553
Angle resolved Auger electron spectroscopy: An alternate tool for identifying electronic excitation processes in solids
[AD-A285375] p 1238 N95-20555
Publications/patents/presentations/honors/student eport. Investigation of the role of vibrational excitation in unimolecular reactions
[AD-A280044] p 1513 N95-20621
Magnetic excitations in modulated PrNi2Si2
[DE95-001077] p 1254 N95-20822
X-ray spectroscopy of xenon
[DE95-002132] p 1240 N95-20865
Correlated wavefunction Monte Carlo studies of excitations in the quantum Hall liquids
[DE95-002337] p 1501 N95-20874
Excess energy and structural dependence of the rate of energy redistribution during the photodissociation of iodotoluenes
[AD-A279997] p 1241 N95-21124
Ultraviolet laser emission properties of Ce(3+)-doped LiSrAlF6
[DE94-016364] p 1372 N95-21135
Studies of selenium and xenon in inductively coupled plasma mass spectrometry
[DE95-001676] p 1245 N95-21734
Molecular design concept for multi-kilovolt x-ray amplification
[DE95-001763] p 1374 N95-21743
Physics of correlated studies
[DE95-001204] p 1581 N95-21842
EXCITONS
Instantaneous frequency dynamics of coherent emission from magnetoexcitons in gallium arsenide
[DE94-018182] p 1569 N95-20677
Temporal and spectral investigation of multi-Landau level quantum beats in GaAs
[DE94-018189] p 1569 N95-20678
Ultrafast magnetoexciton dynamics in GaAs
[DE94-018175] p 1514 N95-20732
Excitons in semiconducting superlattices, quantum wells, and ternary alloys
[DE95-001867] p 1572 N95-21287
Theory of the excitonic lineshape in low-dimensional structures with rough interfaces
[DE95-003434] p 1582 N95-22237
EXERCISE PHYSIOLOGY
Microclimate cooling effect on perceived exertion in four heat/exercise scenarios
[AD-A285549] p 1444 N95-21160
EXHAUST EMISSION
Calculation methods for criteria air pollutant emission inventories
[AD-A284675] p 1400 N95-19964
Reducing exhaust gas emissions from Citydiesel busses
[DE95-700245] p 1380 N95-21295
Analysis of invalid emission testing in the California smog check program
[PB95-128922] p 1406 N95-21373
Two-dimensional imaging of OH in a lean burning high pressure combustor
[NASA-TM-106854] p 1214 N95-21383
EXHAUST FLOW SIMULATION
Radiation from advanced solid rocket motor plumes
[NASA-CR-196554] p 1221 N95-20124
EXHAUST GASES
Helium exhaust studies in the D3-D tokamak
[DE94-016682] p 1552 N95-20334
Reducing exhaust gas emissions from Citydiesel busses
[DE95-700245] p 1380 N95-21295
Ultraviolet emission from rocket motor plumes
[DSTO-TR-0002] p 1222 N95-21661
Gas-phase photocatalytic oxidation: Cost comparison with other air pollution control technologies
[DE95-000241] p 1410 N95-22278
EXHAUST SYSTEMS
Active control of fan noise-feasibility study. Volume 1: Flyover system noise studies
[NASA-CR-195392-VOL-1] p 1505 N95-21888
Natural gas converter performance and durability
[PB95-135554] p 1284 N95-21966
EXOBIOLOGY
Aerospace medicine and biology: A continuing bibliography with indexes (supplement 399)
[NASA-SP-7011(399)] p 1446 N95-21947
EXOTHERMIC REACTIONS
Safe conditions for contacting nitric acid or nitrates with Tri-n-Butyl Phosphate (TBP)
[DE95-001243] p 1235 N95-20215
Ferrocyanide safety project Dynamic X-Ray Diffraction studies of sodium nickel ferrocyanide reactions with equimolar nitrate/nitrite salts
[DE94-017396] p 1236 N95-20268
EXPANSION
Direct numerical simulation of turbulent flow in a sudden pipe expansion p 1347 N95-21067
EXPERIMENT DESIGN
National Ignition Facility: Experimental plan
[DE94-016542] p 1550 N95-20189
Statistical analysis of Turbine Engine Diagnostic (TED) field test data
[AD-A286032] p 1379 N95-20998
ITER EDA Newsletter. Volume 3, no. 2
[DE94-628980] p 1561 N95-21852
Latin hypercube sampling in sensitivity analysis
[AD-A285867] p 1499 N95-22135
Radio-frequency techniques at the ISIS pulsed muon source
[PB95-129854] p 1529 N95-22303
The Double Eagle Space Experiment (DESE) beamline design
[DE94-018319] p 1601 N95-22419
EXPERT SYSTEMS
Tests of an improved oceanographic expert system
[AD-A280123] p 1431 N95-19888
Generating examples for use in tutorial explanations: The use of a subsumption based classifier
[AD-A286028] p 1464 N95-20996
Knowledge refinement in a reflective architecture
[AD-A286027] p 1589 N95-21002
EXPERT system expert: Program description
[PB95-131561] p 1482 N95-21429
EXPERT system expert: Users manual
[PB95-131579] p 1482 N95-21430
SSME HPOTP post-test diagnostic system enhancement project
[NASA-CR-4643] p 1222 N95-21458
Communications and control for electric power systems: Power system stability applications of artificial neural networks
[NASA-CR-197594] p 1483 N95-21613
Advanced computing systems: Usability of knowledge-based planning systems
[AD-A279573] p 1477 N95-21698
Adaptive capture of expert behavior
[DE94-018285] p 1483 N95-21710
Verification of knowledge-based reasoning modules
[PB95-132692] p 1470 N95-21983
Communications and control for electric power systems: Power system stability applications of artificial neural networks
[NASA-CR-197333] p 1484 N95-22171
EXPLOSIONS
Analysis of experimentally shocked minerals by NMR spectroscopy
[DE95-002955] p 1573 N95-21449
EXPLOSIVE DEVICES
Test and Evaluation Plan (TEP) for Improvised Explosive Device Screening Systems (IEDSS)
[AD-A286382] p 1203 N95-22319
EXPLOSIVES
Compatibility testing of explosives and paints by chemiluminescence techniques
[PB95-133609] p 1275 N95-21275
The permeation of bis(2-fluoro-2,2-dinitroethyl) formal (FEFO), ethyl 4,4-dinitropentanoate (EDNP), ethyl 4-nitropentanoate (ENP), and 1,2,4-trichlorobenzene (TCB) through barrier membranes
[DE95-002492] p 1283 N95-21514
Evaluation of state-of-the-art high speed deluge systems presently in service at various US Army ammunition plants
[AD-A279102] p 1287 N95-21598
An initial assessment of the properties of 2,5-dipicryl-1,3,4-oxadiazole: A secondary explosive with high thermal stability
[MRL-TR-93-16] p 1284 N95-21624
The application of a statistical analysis software package to explosive testing
[MRL-TR-93-42] p 1284 N95-21658
Diffuse reflectance spectra of energetic material
[DSTO-TR-0065] p 1284 N95-21951
Sequential shock induced switch tests for Eglin Air Force Base
[DE95-001786] p 1334 N95-22062
EXPONENTIAL FUNCTIONS
Large eddy simulation of turbulent flow over a cavity
p 1347 N95-21069

EXPONENTS
Nonlinear dynamics of the planar pitch attitude motion for a gravity-gradient satellite
[AD-A286407] p 1220 N95-22204
EXPOSURE
The environmental durability of fiber reinforced ceramic matrix composites
[AD-A283750] p 1225 N95-19919
Fracture toughness properties of welded stainless steels for tritium service
[DE95-000755] p 1251 N95-20079
Application of an energy-based life prediction model to bithermal and thermomechanical fatigue
[NASA-TM-106684] p 1385 N95-20179
Test Operations Procedure (TOP) 1-2-616 tropic exposure testing
[AD-A286376] p 1235 N95-20230
Skeletal muscle ischemia and heat shock proteins
[AD-A285364] p 1442 N95-20549
Carboxyhemoglobin formation due to transient exposure to high level carbon monoxide: Experimental results and an explanatory model
[AD-A285476] p 1444 N95-20979
Urban air carcinogens and their effects on health
[DE95-002259] p 1447 N95-22285
EXTINCTION
Temporal evolution of turbulence/chemistry interactions in lifted, turbulent-jet flames
[DE95-002481] p 1243 N95-21512
EXTINGUISHING
A review of water mist technology for fire suppression
[AD-A285738] p 1202 N95-20071
EXTRACTION
Wavelet-based acoustic recognition of aircraft
[DE94-017701] p 1503 N95-20019
Novel catalysts for methane activation
[DE95-002639] p 1237 N95-20438
Feature extraction without edge detection
[AD-A279842] p 1473 N95-22386
EXTRAPOLATION
Has a standard model solution to the solar neutrino problem been found?
[DE94-017580] p 1604 N95-20490
Geometric characterization of electromigration voids (A statistical analysis of electromigration voids)
[AD-A286494] p 1328 N95-21169
EXTRAVEHICULAR ACTIVITY
STS 63: Post flight presentation
[NASA-TM-110514] p 1219 N95-21558
STS Flight 64 mission highlights
[NASA-TM-110515] p 1219 N95-22295
EXTREME ULTRAVIOLET RADIATION
Characterization of an expanded-field Schwarzschild objective for extreme ultraviolet lithography
[DE94-016780] p 1541 N95-20239
A URI program for Ultraviolet/extreme ultraviolet research
[AD-A279159] p 1370 N95-20600
Absolute, Extreme-ultraviolet Solar Spectral Irradiance Monitor (AESSIM)
[AD-A279345] p 1603 N95-21929
Reflective masks for extreme ultraviolet lithography
[DE95-003427] p 1336 N95-22236
Coherence properties of high order harmonic radiation
[DE94-016974] p 1377 N95-22312
EXTREMELY HIGH FREQUENCIES
Design and construction of a Ka-band scatterometer
[AD-A286296] p 1368 N95-22322
EXTREMELY LOW FREQUENCIES
Compilation of 1993 annual reports of the Navy ELF Communications System Ecological Monitoring Program
[AD-A279575] p 1408 N95-21699
Compilation of 1993 annual reports of the Navy ELF Communications System Ecological Monitoring Program. Volume 2: Tabs C-F
[AD-A279770] p 1308 N95-21988
EXTRUDING
Extrudate swell and extrudate distortion of HDPE as a result of different deformation mechanisms during extrusion through capillary dies
[PB95-110227] p 1288 N95-21651
EYE (ANATOMY)
A physiological neural network for saccadic eye movement control
[AD-A279599] p 1441 N95-20301
Space constancy on video display terminals
[AD-A280015] p 1449 N95-20314
Investigation of laser-induced retinal damage: Wavelength and pulsewidth dependent mechanisms
[AD-A286066] p 1443 N95-20848
EYE MOVEMENTS
The spatiotemporal characteristics of visual motion priming
[AD-A284782] p 1449 N95-20062
Space constancy on video display terminals
[AD-A280015] p 1449 N95-20314
Visual perception of elevation
[AD-A284938] p 1451 N95-22472
EYE PROTECTION
Broadband thermal optical limiter for the protection of eyes and sensors
[AD-D016493] p 1377 N95-22304

F

F REGION
Mitigation of the effects of F layer regularities by using multiple paths p 1298 N95-20951
Global ionospheric weather
[AD-A285520] p 1430 N95-21177
The effects of magnetic storm phases on F-layer irregularities from auroral to equatorial latitudes
[AD-A286173] p 1427 N95-22423
F-14 AIRCRAFT
Naval aviation: F-14 upgrades are not adequately justified. Report to Congressional Committees
[AD-A286338] p 1206 N95-20212
F-15 AIRCRAFT
F-15 resource tape
[NASA-TM-110502] p 1206 N95-19994
F-16 AIRCRAFT
F-16XL interview with Marta Bohn-Meyer
[NASA-TM-110505] p 1200 N95-19996
F-18 AIRCRAFT
Pressure measurements on an F/A-18 twin vertical tail in buffeting flow. Volume 1: Wind tunnel test summary
[AD-A279126] p 1202 N95-21877
FABRICATION
Collocated tunable wavenumber sensor/actuators for smart structures
[AD-A279608] p 1312 N95-19958
Fabrication and properties of alumina matrix composites containing nickel aluminide reinforcements
[DE94-018703] p 1250 N95-20044
Polycrystalline CuInSe2 and CdTe solar cells
[DE94-011875] p 1392 N95-20333
Fabrication and testing of a silicon immersion grating for infrared spectroscopy
[DE94-017173] p 1237 N95-20386
Status of diffused junction p+n InP solar cells for space applications p 1317 N95-20509
Development, fabrication, and metrology of the electro-optical breadboard model for the reflection grating array of the XMM grating spectrometer
[DE94-016605] p 1543 N95-20612
Packaging the MAMA module p 1209 N95-20639
The production of calibration specimens for impact testing of subsize Charpy specimens
[DE94-018125] p 1386 N95-20703
Method of fabricating a microelectronic photomultiplier device with integrated circuitry
[AD-D016530] p 1325 N95-20726
Microdynamic devices fabricated on silicon-on-sapphire substrates
[AD-D016531] p 1325 N95-20727
Scale-up and modeling of forced chemical vapor infiltration
[DE94-017769] p 1340 N95-20781
Fabrication of ceramic composites: Forced CVI
[DE95-001076] p 1271 N95-20821
GPHS-RTGs in support of the Cassini Mission
[DE95-001492] p 1222 N95-20853
Complementary GaAs junction-gated heterostructure field effect transistor fabrication for integrated circuits
[DE95-001522] p 1327 N95-20882
HTS Josephson technology on silicon with application to high speed digital microelectronics
[AD-A285964] p 1328 N95-21178
Excitons in semiconducting superlattices, quantum wells, and ternary alloys
[DE95-001867] p 1572 N95-21287
Complementary GaAs junction-gated heterostructure field effect transistor technology
[DE94-018901] p 1329 N95-21390
Comparison of properties of sintered and sintered reaction-bonded silicon nitride fabricated by microwave and conventional heating
[DE95-001426] p 1275 N95-21501
Surface micromachined capacitive tactile image sensor
[PB95-108031] p 1288 N95-21633
Atom wave interferometer
[AD-A279532] p 1524 N95-21688
Design and development SAWAFE peak detector chip
[DE95-001745] p 1332 N95-21742
Application of quaternary phase diagrams to compound semiconductor processing
[DE95-001813] p 1277 N95-21748
Integration of thin film decoupling capacitors
[DE95-001609] p 1333 N95-21881
Performance of cesium telluride photocathodes as an electron source for the Los Alamos FEL
[DE94-018302] p 1375 N95-21919
Development of active-transport membrane devices
[DE94-015947] p 1246 N95-21921
Analysis of cost: Combustion flame CVD diamond deposition
[AD-A279153] p 1278 N95-21973
Design, fabrication, and characterization of reflective diffractive optical elements in Si for free-space optical interconnects
[AD-A286416] p 1547 N95-22205
Fabrication of PLZT/ITO grating for optical switching and reconfigurable optical interconnect applications
[AD-A286389] p 1548 N95-22248
Development of practical high temperature superconducting wire for electric power applications
[DE94-017894] p 1336 N95-22271
Parallel nanometer scale fabrication
[DE95-002122] p 1336 N95-22284
Fabrication and characterization of cesium telluride photocathodes: A promising electron source for the Los Alamos Advanced FEL
[DE94-018303] p 1377 N95-22348
FABRICS
Effect of fiber fabric orientation on the monotonic and fatigue behavior of a continuous fiber ceramic composite
[DE94-018121] p 1271 N95-20700
Zirconia precipitates and zirconia: GeO2 interphase in mullite matrix-SiC woven fabrics composites prepared through a sol-gel route
[PB95-133427] p 1275 N95-21272
FACE (ANATOMY)
Thermal resistance of the cheek in cold air
[AD-A286257] p 1446 N95-22001
FACSIMILE COMMUNICATION
Facsimile transmission standards
[AD-A279911] p 1290 N95-20308
FACTORIZATION
O(log2 n) time efficient parallel factorization of dense, sparse separable, and banded matrices
[NASA-CR-197356] p 1473 N95-19885
Factorization in closed string field theory
[PB95-133542] p 1580 N95-21030
Minimal square spectral factors
[PB95-132726] p 1495 N95-22032
FADING
Angle diversity on digital microwave links: Antenna design and experimental results p 1297 N95-20947
Mitigation of the effects of F layer regularities by using multiple paths p 1298 N95-20951
Performance of a fast frequency-hopped noncoherent MFSK receiver over Rician fading channels with either partial-band interference or multi-tone interference
[AD-A286168] p 1310 N95-22246
FAILURE
Adaptive fault-resistant systems
[AD-A286406] p 1484 N95-22203
Advanced Materials and Process Technology for Mechanical Failure Prevention (proceedings of the 48th Meeting of the Mechanical Failures Prevention Group
[AD-A285785] p 1233 N95-22399
FAILURE ANALYSIS
Physics and applications of defects in advanced semiconductors, volume 325
[AD-A280059] p 1563 N95-19886
Inelastic torsion of steel I-beams
[PB94-208360] p 1384 N95-20101
The numerical integration and 3-D finite element formulation of a viscoelastic model of glass
[DE95-002588] p 1271 N95-20788
Finite element modelling of creep crack growth in 316 stainless and 9Cr-1Mo steels
[DE94-018977] p 1258 N95-21560
Advanced Materials and Process Technology for Mechanical Failure Prevention (proceedings of the 48th Meeting of the Mechanical Failures Prevention Group
[AD-A285785] p 1233 N95-22399
FAILURE MODES
Analysis of the progressive failure of brittle matrix composites
[NASA-CR-195415] p 1225 N95-19951
Advanced Packaging Concepts for Digital Avionics
[AGARD-CP-562] p 1208 N95-20631
Gate oxide shorts in nMOS transistors: Electrical properties and lifetime prediction method
[DE94-018904] p 1330 N95-21545
FALKNER-SKAN EQUATION
Acoustic receptivity due to weak surface inhomogeneities in adverse pressure gradient boundary layers
[NASA-TM-4577] p 1353 N95-21258
FALSE ALARMS
Probability of detection for a GO CFAR radar processor using envelope detection approximation
[AD-A286211] p 1310 N95-22251

FAR FIELDS

Analytic models for beam propagation and far-field patterns in slab and bow-tie x ray lasers
[DE94-016607] p 1372 N95-21173

FAR INFRARED RADIATION

Gordon Research Conference on Physical Electrochemistry
[AD-A286545] p 1240 N95-20842

Signal to noise improvements with a new Far-IR rapid-scan Michelson Interferometer
[DE95-002416] p 1367 N95-21638

Pushing the limits of spatial resolution with the Kuiper Airborne observatory p 1593 N95-21754

Azimuthally averaged radial S(sub 100 microns)/S(sub 60 microns) dust color temperatures in spiral galaxies
p 1593 N95-21760

Far-Infrared sources and diffuse emission in M31
p 1593 N95-21761

Correlation of far-infrared emission and radio continuum emission along the major axis of edge-on spiral galaxies
p 1593 N95-21762

Far-infrared mapping of dusty elliptical galaxies
p 1593 N95-21763

A HIRES analysis of the FIR emission of supernova remnants p 1594 N95-21770

Growth and electrical and far-infrared properties of wide electron wells in semiconductors
[AD-A279409] p 1333 N95-21917

FARADAY EFFECT

Nonlinear Faraday effect in CdS semiconductor in an ultrahigh magnetic field
[DE94-016804] p 1564 N95-20240

High frequency current sensors using the Faraday effect in optical fibers
[DE95-001859] p 1545 N95-21728

FAST FOURIER TRANSFORMATIONS

Simulation of stellar speckle imaging
[DE94-016606] p 1412 N95-19985

Electrochemical impedance pattern recognition for detection of hidden chemical corrosion on aircraft components
[AD-A284998] p 1253 N95-20481

Xwake 1.0 user's manual
[DE95-002528] p 1463 N95-20901

The sharper image: Implementing a Fast Fourier Transform (FFT) to enhance a video-captured image
[AD-A279790] p 1445 N95-21180

Measurement of sound intensity and sound power
[AD-A279246] p 1505 N95-21984

FAST NEUTRONS

Non destructive characterization using pulsed fast-thermal neutrons
[DE95-002601] p 1511 N95-20422

Influence of oxidation on radiation hardness of silicon detectors
[DE95-002466] p 1272 N95-20894

FAST NUCLEAR REACTORS

Reactor pumped laser research at the Sandia National Laboratories pulsed reactor facilities
[DE95-002181] p 1371 N95-20867

FASTENERS

Displaceable spur gear torque controlled driver and method
[NASA-CASE-MSC-22381-1] p 1378 N95-20409

Eddy current for detecting second-layer cracks under installed fasteners
[AD-A279871] p 1382 N95-20414

Attachment methodology for composite cylinder assembly
[AD-D016578] p 1227 N95-20459

Attachment methodology for composite cylinder assembly
[AD-D016256] p 1381 N95-22034

FATIGUE (MATERIALS)

Turbulence descriptors for scaling fatigue loading spectra of wind turbine structural components
[DE94-011833] p 1384 N95-20109

The processing and mechanical properties of high temperature/high performance composites. Fatigue and creep, book 3
[AD-A279738] p 1227 N95-20430

Flux-focusing eddy current probe and rotating probe method for flaw detection
[NASA-CASE-LAR-15231-1-SB] p 1383 N95-20764

2nd International ADI seminar
[PB95-127734] p 1255 N95-21108

Accuracy problems in the generation of discrete time stochastic processes
[PB95-131397] p 1386 N95-21133

Microstructural design for tough ceramics
[AD-A285634] p 1273 N95-21152

Crack closure and sequential effects in fatigue: A literature survey
[PB95-131637] p 1387 N95-21557

Derived gust spectra for the Macchi MB326H
[ARL-TN-3] p 1202 N95-21892

Influence of fatigue crack closure on the growth rate of surface flaws
[AD-A279130] p 1387 N95-21967

FATIGUE LIFE

Application of an energy-based life prediction model to bithermal and thermomechanical fatigue
[NASA-TM-106684] p 1385 N95-20179

Crack closure and sequential effects in fatigue: A literature survey
[PB95-131637] p 1387 N95-21557

Effects of cyclic stress distribution models on fatigue life predictions
[DE95-001619] p 1388 N95-22070

Structural performance of cylindrical pressure housings of different ceramic compositions under external pressure loading. Part 3: Sintered reaction bonded silicon nitride ceramic
[AD-A285773] p 1388 N95-22411

FATIGUE TESTS

The mechanical property data base from an Air Force/Industry cooperative test program on advanced aluminum alloys
[AD-A280038] p 1386 N95-20615

Accuracy problems in the generation of discrete time stochastic processes
[PB95-131397] p 1386 N95-21133

Microstructural design for tough ceramics
[AD-A285634] p 1273 N95-21152

Lubricant evaluation and performance, 2
[AD-A279144] p 1278 N95-21969

FAULT DETECTION

Flux-focusing eddy current probe and rotating probe method for flaw detection
[NASA-CASE-LAR-15231-1-SB] p 1383 N95-20764

Fault detection techniques for complex cable shield topologies
[AD-A286632] p 1291 N95-20771

An empirical approach to logical clustering of software failure regions
[AD-A279863] p 1462 N95-20776

SSME HPOTP post-test diagnostic system enhancement project
[NASA-CR-4643] p 1222 N95-21458

Defect classes: An overdue paradigm for CMOS IC testing
[DE94-018905] p 1334 N95-22118

FAULT TOLERANCE

Fault tolerance of neural networks
[AD-A285098] p 1479 N95-20057

Comparison of Ward and Mellor's transformation schema with State- and Activitycharts
[PB95-110698] p 1459 N95-20258

System level fault tolerance in parallel and distributed computing systems
[AD-A279664] p 1474 N95-20305

A group communication approach for mobile computing mobile channel: An ISIS tool for mobile services
[AD-A279785] p 1290 N95-20306

Fault-tolerance in distributed and multiprocessor real-time systems
[AD-A279896] p 1461 N95-20595

The Advanced Avionics Subsystem Technology Demonstration Program p 1209 N95-20636

Backward error recovery in redundant disk arrays
[AD-A286064] p 1463 N95-20846

Compositional proof theory for fault tolerant real-time distributed systems
[PB95-127601] p 1465 N95-21025

Non-intrusive SCSI status sensing system
[AD-D016242] p 1476 N95-21307

Numerical and symbolic algorithms for application and specific signal processing
[AD-A279902] p 1305 N95-21576

Top-down non-correcting error recovery in LLgen
[PB95-132718] p 1471 N95-22031

Formal specification and compositional verification of an atomic broadcast protocol
[PB95-110508] p 1472 N95-22351

FAULT TREES

Software fault tree analysis of concurrent Ada processes
[AD-A284979] p 1457 N95-20042

FEASIBILITY

Liquid xenon as a potential laser host medium
[AD-A285365] p 1370 N95-20550

FEASIBILITY ANALYSIS

The personal aircraft: Status and issues
[NASA-TM-109174] p 1200 N95-20688

Feasibility study of power generation system with shape memory alloys
[DE95-714802] p 1254 N95-20890

Development of a portable ice-thickness measuring instrument
[AD-A279472] p 1433 N95-21291

Economic feasibility analysis of distributed electric power generation based upon the natural gas-fired fuel cell
[DE94-012277] p 1396 N95-22033

FEDERAL BUDGETS

An update on the Department of Energy's photovoltaic program p 1316 N95-20505

FEED SYSTEMS

The ITER in-vessel system
[DE94-018053] p 1560 N95-21665

FEEDBACK

Six-dimensional modeling of coherent bunch instabilities and related feedback systems in storage rings with power-series maps for the lattice
[DE94-017965] p 1532 N95-20494

A comparison of decision making behaviour in a static and a dynamic task environment as a function of time pressure
[AD-A285389] p 1449 N95-20609

Apparatus and method for determining the mass density of a filament
[NASA-CASE-LAR-14879-1-CU] p 1383 N95-20616

Modeling and identification of parallel and feedback nonlinear systems
[DE95-001006] p 1481 N95-20812

Multiple burn fuel-optimal orbit transfers: Numerical trajectory computation and neighboring optimal feedback guidance
[NASA-CR-197317] p 1222 N95-21616

Effect of lags on human performance with head-coupled simulators
[AD-A279577] p 1453 N95-21700

Monolithic low noise preamplifier for piezoelectric sensors
[AD-D016524] p 1333 N95-21865

FEEDBACK CONTROL

Asymptotic analysis of Nash equilibria in nonzero-sum linear-quadratic differential games. The two-player case
[PB95-111027] p 1499 N95-19941

Optimal distributed control system for a linear distributed parameter system
[AD-D016583] p 1480 N95-20202

A charge distribution analysis instrument for catalysis and material science applications
[DE94-016489] p 1364 N95-20233

Designing the architecture of hierachical neural networks model attention, learning and goal-oriented behavior
[AD-A279898] p 1452 N95-20562

An integrated architecture of adaptive neural network control for dynamic systems
[DE94-014813] p 1481 N95-20693

Riccati equation theory for Pritchard-Salamon systems: A Popov function approach
[PB95-137089] p 1491 N95-20830

Semi-global stabilization of linear discrete-time systems subject to input saturation via linear feedback: An ARE-based approach
[PB95-135463] p 1483 N95-21618

Design of robust optimal control systems and stability analysis of real structured uncertainties
[AD-A279089] p 1483 N95-21913

Optimal control of a two wheeled mobile robot
[AD-A286130] p 1485 N95-22233

Drag reduction strategies p 1361 N95-22453

FEEDFORWARD CONTROL

A neural expert approach to self designing flight control systems
[AD-A279965] p 1215 N95-21122

Learning algorithms for feedforward networks based on finite samples
[DE95-001739] p 1483 N95-21741

Mathematical theory of neural networks
[AD-A286508] p 1485 N95-22213

A survey of artificial neural network applications in flow analysis of energy networks
[DE95-002452] p 1486 N95-22430

FELDSPARS

Analysis of experimentally shocked minerals by NMR spectroscopy
[DE95-002955] p 1573 N95-21449

Semi-volatiles at Mercury: Sodium (Na) and potassium (K) p 1424 N95-21818

FERMENTATION

Bioconversion of coal derived synthesis gas to liquid fuels
[DE94-017381] p 1282 N95-19927

Bioconversion of coal derived synthesis gas to liquid fuels
[DE94-018849] p 1314 N95-20339

Microbiology and physiology of anaerobic fermentations of cellulose
[DE95-002899] p 1438 N95-20917

FERMI LIQUIDS

Angle resolved photoemission on K(0.3)Mo3, TiTe2 and Ti(1+x)S2
[DE94-018300] p 1574 N95-21712

An asymptotic solution of the (infinity)-d Hubbard model
[DE94-629042] p 1582 N95-21994
FERMI SURFACES
Angle resolved photoemission on K(0.3)Mo3, TiTe2 and Ti(1+x)S2
[DE94-018300] p 1574 N95-21712
FERMIONS
Chiral symmetry and lattice gauge theory
[DE94-018676] p 1564 N95-20130
A Monte Carlo study of the minus sign problem in the t-J model using an Intel iPSC/860 hypercube
[DE95-001072] p 1570 N95-20819
A high-rate fixed-target charm experiment
[DE95-001767] p 1521 N95-21378
Charge density of fractional charged quasiparticles in the composite fermion picture
[DE94-018122] p 1524 N95-21703
FERRITES
The origin of acicular ferrite in gas metal arc and submerged arc welds
[AD-A286129] p 1377 N95-19984
The effect of oxide inclusions on the kinetics of the austenite to ferrite transformation in low alloy steel weld metal
[DE94-018131] p 1253 N95-20676
Moessbauer study of the sintered Mn(0.70)Zn(0.23)Fe(2.07)O4
[DE94-631462] p 1255 N95-20909
Classification of bianisotropic media
[PB95-127635] p 1502 N95-21102
FERROELECTRICITY
Materials for adaptive structural acoustic control, volume 2
[AD-A279222] p 1502 N95-19883
The role of high pressure in the study and applications of the ferroelectric polymer polyvinylidene fluoride and its copolymers
[DE94-015742] p 1268 N95-20396
Ferroic materials: Design, preparation and characteristics. Ceramic transactions, volume 43
[AD-A285937] p 1270 N95-20664
Development of ferroelectric liquid crystals with enhanced nonlinear optical properties
[AD-A279988] p 1571 N95-20965
Raman spectra of MOCVD-grown ferroelectric PbTiO3 thin films
[DE94-018964] p 1244 N95-21549
Domain processes in ferroelectric ceramics
[AD-A279567] p 1276 N95-21697
Integration of thin film decoupling capacitors
[DE95-001609] p 1333 N95-21881
FERROMAGNETIC MATERIALS
Changes in the behavior of magnetic materials undergoing processing in electrical rotating machines
[PB95-104493] p 1325 N95-20702
Photoemission and ferromagnetism
[DE95-002419] p 1520 N95-21362
Coaxial hybrid wiggler
[AD-D016501] p 1331 N95-21671
Magnetic properties of the three-dimensional Ising model with an interface amorphization
[DE94-628992] p 1278 N95-21885
FERROMAGNETISM
Photoemission and ferromagnetism
[DE95-002419] p 1520 N95-21362
Theory of spin dynamics in the classical two-dimensional heisenberg magnet
[PB95-133559] p 1502 N95-22138
FIBER COMPOSITES
The environmental durability of fiber reinforced ceramic matrix composites
[AD-A283750] p 1225 N95-19919
Analysis of the progressive failure of brittle matrix composites
[NASA-CR-195415] p 1225 N95-19951
Thermo-mechanical fatigue of polymer matrix composites
[AD-A285931] p 1267 N95-20390
The processing and mechanical properties of high temperature/high performance composites. Stress redistribution and notch properties, book 2
[AD-A279737] p 1227 N95-20429
The processing and mechanical properties of high temperature/high performance composites. Fatigue and creep, book 3
[AD-A279738] p 1227 N95-20430
The processing and mechanical properties of high temperature/high performance composites. Book 7: In-situ measurements of stress and damage
[AD-A279814] p 1227 N95-20583
Effect of fiber fabric orientation on the monotonic and fatigue behavior of a continuous fiber ceramic composite
[DE94-018121] p 1271 N95-20700
Wear resistant composite structure of vitreous carbon containing convoluted fibers
[DE95-002254] p 1228 N95-20787
The processing and mechanical properties of high temperature/high performance composites. Mechanism-based constitutive laws and design, book 1
[AD-A279736] p 1228 N95-20801
Detection of environmental deterioration in fiber reinforced composites by FT-Raman spectroscopy, phase 1
[AD-A279763] p 1228 N95-20805
Carbon fiber reinforced superconductor composites
[DE95-002504] p 1229 N95-20913
Toughened Silcomp composites for gas turbine engine applications
[DE95-002851] p 1214 N95-21243
Significance of impact velocity for the extent of damage in carbon/epoxy laminates
[PB95-133484] p 1230 N95-21417
A transmission electron microscope characterization of sodium sulfate hot corrosion of silicon carbide fiber-reinforced lithium aluminosilicate glass-ceramic matrix composite
[AD-A286164] p 1231 N95-22038
Effect of laser radiation on carbon fibre/epoxy composites
[PB95-133526] p 1232 N95-22096
Embedded optical fibres as strain sensors in polymer matrix fibre composites: The influence of adhesion in strain transfer
[PB95-133617] p 1547 N95-22140
Fibre-reinforced high-strength concrete
[PB95-131942] p 1232 N95-22158
Implementation of the Military Handbook 17 for polymer matrix composites and metal matrix composites
[AD-A285772] p 1233 N95-22395
FIBER OPTICS
Fiber laser amplifiers and oscillators
[AD-A285835] p 1368 N95-20035
Program of the 1993 9th Interdisciplinary Laser Science Conference (ILS-9)
[AD-A285131] p 1369 N95-20082
Proceedings of the International Wire and Cable Symposium
[AD-A279242] p 1403 N95-20465
Optical backplane for modular avionics
p 1212 N95-20652
High performance backplane components for modular avionics p 1212 N95-20653
Detection of environmental deterioration in fiber reinforced composites by FT-Raman spectroscopy, phase 1
[AD-A279763] p 1228 N95-20805
Mandrel based embedded planar fiber-optic interferometric acoustic sensor
[AD-D016229] p 1504 N95-21119
Fiber-optic control of current filaments in high gain photoconductive semiconductor switches
[DE94-015804] p 1328 N95-21139
A three-dimensional orthogonal laser velocimeter for the NASA Ames 7- by 10-foot wind tunnel
[NASA-TM-108864] p 1366 N95-21323
Method for characterization of optical waveguide devices using partial coherence interferometry
[AD-D016525] p 1544 N95-21466
Fiber-optic sensors for rapid, inexpensive characterization of soil and ground water contamination
[DE95-002471] p 1545 N95-21510
Fiber-optic rotary joint with bundle collimator assemblies
[AD-D016504] p 1545 N95-21673
Electromagnetic radiation detector utilizing an electromagnetic radiation absorbing element in a mach-zehnder interferometer arrangement
[AD-D016507] p 1306 N95-21835
Optical processing and control
[AD-A279157] p 1546 N95-21975
Fiber optic pressure sensing array
[AD-D016245] p 1506 N95-22088
FIBER ORIENTATION
Effect of fiber fabric orientation on the monotonic and fatigue behavior of a continuous fiber ceramic composite
[DE94-018121] p 1271 N95-20700
FIBER VOLUME FRACTION
Role of internal stresses in fracture behavior of engineering composites
[DE95-001106] p 1229 N95-20912
Fibre-reinforced high-strength concrete
[PB95-131942] p 1232 N95-22158
FIBER-MATRIX INTERFACES
The processing and mechanical properties of high temperature/high performance composites. Book 5: Interface effects
[AD-A279815] p 1228 N95-20584
Time-dependent deformation of titanium metal matrix composites
[NASA-CR-195030] p 1230 N95-21363
FIBERS
The processing and mechanical properties of high temperature/high performance composites. Book 5: Interface effects
[AD-A279815] p 1228 N95-20584
Apparatus and method for determining the mass density of a filament
[NASA-CASE-LAR-14879-1-CU] p 1383 N95-20616
FIBROBLASTS
Study of pulsed laser effects on living tissues
[PB95-131330] p 1447 N95-22361
FIELD COILS
Joule heating of the ITER TF cold structure: Effects of vertical control coil currents and ELMS
[DE95-001817] p 1560 N95-21724
The superconducting magnet system for the Tokamak Physics Experiment
[DE94-018329] p 1562 N95-22300
FIELD EFFECT TRANSISTORS
Proton irradiation effects on advanced digital and microwave III-V components
[DE94-018742] p 1314 N95-20338
Development of a tester for evaluation of prototype thermal cells and batteries
[DE95-000540] p 1325 N95-20628
Complementary GaAs junction-gated heterostructure field effect transistor fabrication for integrated circuits
[DE95-001522] p 1327 N95-20882
SPICE macro model of a spryton with MOSFET's in the avalanche mode
[DE94-015744] p 1555 N95-21134
Complementary GaAs junction-gated heterostructure field effect transistor technology
[DE94-018901] p 1329 N95-21390
On-wafer, cryogenic characterization of ultra-low noise HEMT devices p 1305 N95-21539
Plastic encapsulated parts
[DE95-001876] p 1332 N95-21729
FIELD EMISSION
Field-emitter arrays for RF vacuum microelectronics
[AD-A279959] p 1325 N95-20661
FIELD OF VIEW
Factors affecting the perception of luning in monocular regions of partial binocular overlap displays
[AD-A286287] p 1547 N95-22044
Occupant reach and mobility apparatus
[AD-D016253] p 1454 N95-22099
FIELD THEORY (ALGEBRA)
Classification of diagonal coset modular invariants
[PB95-111118] p 1489 N95-20259
FIELD THEORY (PHYSICS)
Truly distribution-independent algorithms for the N-body problem
[DE94-014238] p 1458 N95-20136
Von Neumann algebra automorphisms and time-thermodynamics relation in general covariant quantum theories
[PB95-111084] p 1580 N95-20324
Theoretical particle physics
[DE95-002447] p 1515 N95-20893
New improved derivative expansion for field theories with spontaneous symmetry breaking
[DE94-019349] p 1580 N95-21486
The method of evaluating quantum partition function for the Hubbard model
[DE94-628991] p 1581 N95-21639
Second order approximation for optical polaron in the strong coupling case
[DE94-628997] p 1525 N95-21856
Biaxiality of chiral liquid crystals
[DE94-629032] p 1578 N95-22277
FIGHTER AIRCRAFT
Effects of bifocal and progressive-addition corrective lenses on aviator target-detection performance
[AD-A279698] p 1442 N95-20710
FIGURE OF MERIT
Millimeter wave front-end figure of merit, part 1
[AD-A279093] p 1307 N95-21915
FILAMENT WINDING
Multi-layered translated rib-stiffened composite hollow cylinder assembly
[AD-D016566] p 1226 N95-20292
